INTRODUCTION

THIS is the third year of publication of the BRITANNICA BOOK OF THE YEAR. In normal times this volume, which has now established itself as a much valued source of world-wide information on a vast range of subjects, appears in two issues, similar but different. One is designed primarily for the use of readers in Great Britain and the British Empire, the other for readers in the United States. The greater part of the text has always been common to both issues, the balance only in each of the two issues has laid respective emphasis upon the more purely domestic interests of the two sections of the English-speaking peoples.

This year various factors, the shortage of paper, its extremely high cost, the rapidly increasing costs of labour for printing and binding, war-risks insurance, would have combined to turn what has never yet been a profitable enterprise in Great Britain into a certain loss, had it been undertaken. With profound regret, therefore, the publishers had to content themselves on this occasion with the publication of one issue only, that designed primarily for the American continent. They are conscious, however, that the very conditions which have made the production of a separate British issue impossible raise some questions of particular and special interest to British readers, on which authoritative and dispassionate information is more than ever necessary.

The publishers have endeavoured to supply this need by means of a supplement to which this is the introduction. This supplement, containing upwards of 20,000 words, immediately follows. It has been edited and prepared in London with the collaboration of the foremost experts on the subjects discussed. The table of contents will show the unique authority of the contributors we have been fortunate enough to enlist.

The main part of this book is the BRITANNICA BOOK OF THE YEAR in its American form. As in previous years a very substantial proportion of the material is the work of the best European minds collaborating with American experts. We present this volume to our readers in the sure expectation that a view of the world seen from a neutral but friendly standpoint may prove of unique value at the present time.

M. D. LAW

LONDON, January 1940.

LIST OF CONTRIBUTORS AND CONTENTS

DIARY OF EVENTS THROUGHOUT THE BRITISH EMPIRE

AIR RAID PRECAUTIONS

By ADMIRAL SIR E. R. G. EVANS, K.C.B., D.S.O., LL.D.

Second in command British Antarctic Expedition under Captain Scott, 1909-13; Commanded H.M.S. "Broke", 1917; Lord Rector of Aberdeen University, 1937-39; Regional Commissioner London Civil Defence Area.

ECONOMIC WARFARE

By THOMAS BALOGH

Honorary Lecturer, University College, London; Research Associate, The National Institute of Economic and Social Research.

EMERGENCY LEGISLATION

By JOHN KERR

Barrister-at-Law of the Middle Temple.

EVACUATION

By DOROTHY HARWOOD

Member of the Royal Institute of International Affairs. Author of papers on *Emigration from Great Britain*, prepared for the International Studies Conference, 1937; on *White Colonization in the Tropics*, prepared for the Committee of the International Geographical Congress, 1938.

FOOD SUPPLIES IN WAR

By P. LAMARTINE YATES, M.A.

Research Worker in Agricultural Economics.

HOSPITALS

By SIR HENRY B. BRACKENBURY, M.D., LL.D., M.R.C.S.

Vice-President (late Chairman of Council), British Medical Association; Chairman of Council of the Tavistock Clinic; Member of the General Medical Council.

INDUSTRY, WAR CONTROL OF

By CLAUDE W. GUILLEBAUD

University Lecturer in Economics, Cambridge; with Supreme Economic Council in Paris, 1919-20; Secretary of Committee on Prices under Profiteering Act, 1920-21; member of Rubber Manufacturing and Shirt-making Trade Boards, 1939; author of *The Economic Recovery of Germany 1933-38*.

NATIONAL SERVICE

By W. T. WELLS, B.A. (Oxon)

Formerly Oxford University Extension Lecturer in History and Political Theory.

WAR AND PEACE AIMS

By ERNEST BARKER, LITT.D., D.LITT., HON.LL.D

Professor of Political Science, Cambridge, 1927-39; author of *Greek Political Theory; English Political Thought from 1848 to 1914*; etc.

WAR FINANCE

By G. FINDLAY SHIRRAS, M.A.

WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES

By G. FINDLAY SHIRRAS, M.A.

WELFARE AGENCIES, WAR

By DOROTHY A. CANNELL

Member of the editorial staff, 14th edition, *Encyclopædia Britannica*. English writer and television script specialist. Member of the Egypt Exploration Society.

WOMEN'S WAR ORGANIZATIONS

By DOROTHY A. CANNELL

DIARY OF EVENTS THROUGHOUT THE BRITISH EMPIRE

EXCLUDING THE COURSE OF HOSTILITIES

From January 1st, 1939—December 31st, 1939

1939

Jan. 1 : **Palestine**.—Figures of casualties in 1938 were published showing 69 British killed, 92 Jews, 486 Arabs, and 1,138 armed rebels.

Jan. 2 : **Eire**.—A new Irish Association was formed to promote mutual goodwill and co-operation between the people of Eire and of Northern Ireland.

Jan. 12 : **Canada**.—Government proposals were put forward for augmenting the rearmament programme.

Jan. 13 : **Australia**.—Bush fires in Victoria swept huge areas killing 67 people and destroying much property.

Jan. 16 : **Great Britain**.—Arrangements were completed for the supply of steel air-raid shelters to occupants of small houses.

Jan. 17 : **Palestine**.—There was a new outbreak of terrorism.

Great Britain.—An auxiliary air force reserve was formed.

Jan. 19 : **Aden**.—Aden celebrated the centenary of British rule.

Jan. 21 : **Kenya**.—An Immigration Advisory Board was set up at Nairobi to control the influx of refugees.

South Africa.—The Union government bought a tract of farming land of some 700,000 hectares in S.W. Africa against bidding by the German government.

Jan. 24 : **Canada**.—A Defence Purchasing Board was established, and the government proposed to seek authority to borrow for the defence programme.

Jan. 25 : **Hongkong**.—A new air service was announced, linking Yunnan with Hongkong.

Jan. 27 : **Canada**.—A government investigation was ordered into allegations that Nazi propaganda was being conducted by German officials.

Jan. 29 : **India**.—Mr. Subhas Chandra Bose was re-elected president of the Indian National Congress.

Feb. 2 : **Transvaal**.—The value of the gold production in 1938 was stated to be £86,367,862.

Feb. 3 : **United Kingdom**.—Bombs exploded in two London tube stations. A round-up of Irishmen suspected of subversive activities in connexion with the I.R.A. began.

Feb. 4 : **Muscat**.—A new treaty of Friendship, Commerce, and Navigation was signed at Muscat (Oman) between Great Britain and India, and Muscat.

Feb. 6 : **United Kingdom**.—Mr. Chamberlain gave his pledge of immediate aid to France if her vital interests were attacked.

Australia.—The Federal cabinet decided to organize the country as a storehouse for the maintenance of her own people and to help the peoples of Great Britain in case of war.

Feb. 7 : **Palestine**.—The conferences between the British government and delegations of Jews and Arabs opened in London.

Feb. 9 : **Palestine**.—The Chief of the Im-

perial General Staff arrived in Jerusalem and inspected railway and other military posts.

Australia.—The minister for external affairs stated that owing to its position with regard to Papua and Australia New Guinea must be held at all costs.

Feb. 11 : **Australia**.—The first-line air strength was raised to 212 machines. A separate department for native affairs was created.

India.—Constitutional reforms involving greater co-operation with representative public opinion were announced by H.H. the Maharaja of Kashmir.

Serious rioting occurred between Hindus and Moslems at Cawnpore.

Feb. 12 : **Kenya**.—The report of a committee appointed to consider problems of land settlement was published.

Feb. 13 : **United Kingdom**.—Plans for the construction of permanent holiday camps for evacuated children were announced by the government.

Feb. 14 : **India**.—Proposals for the enforcement of prohibition in Bombay were made by the finance minister of the Bombay government.

Jamaica.—The island was placed under a "state of emergency" owing to a general strike order by workers' leader.

Feb. 16 : **Jamaica**.—The general strike was called off.

Feb. 19 : **British Guiana**.—An Anglo-American Commission was established to enquire into the possibility of refugee settlement in this colony.

Feb. 25 : **Malta**.—Royal Letters Patent were proclaimed granting a new constitution to Malta.

Malaya.—Further steps in the efficient organization of defence were taken and arrangements were made for the fortification of Penang.

Feb. 26 : **Palestine**.—There were a number of bomb and gun outrages.

Feb. 27 : **Canada**.—Alberta announced continuance of the default in interest payments.

Feb. 28 : **Australia**.—The Commonwealth recognized General Franco's government.

Channel Islands.—The Jersey States adopted a Bill authorizing a loan of £100,000 for defence.

India.—The Budget for 1939-40 was published. A surplus was to be acquired from doubling the Customs tariff on raw cotton.

Palestine.—A conference of all representatives of Palestine Jewry, save the Revisionists, opened in Jerusalem to discuss the British government's plan for a Palestine State.

Rhodesia.—A "Hands off Africa" conference was held at Bulawayo.

March 1 : **Kenya**.—The Order-in-Council reserving the Kenya highlands exclusively for European settlement came into effect.

March 3 : **India**.—In order to secure a more democratic form of government

in Rajkot State, Mr. Gandhi began a "fast unto death."

March 4 : **Canada**.—The admission in the spring of several hundred families of Sudeten German refugees was sanctioned.

March 7 : **India**.—Following intervention by the viceroy and settlement of the Rajkot State dispute, Mr. Gandhi ended his fast.

March 8 : **United Kingdom**.—Mr. Hore-Belisha, introducing the army estimates, reviewed in detail future plans for the British army.

Government assistance was promised in the creation of a £10,000,000 Chinese exchange stabilization fund.

March 16 : **Palestine**.—The British government's proposals for an agreed settlement were rejected by the Jewish delegation.

March 17 : **Palestine**.—The British government's proposals were also rejected by the Arab delegation.

South-West Africa.—Germany protested against immigration restrictions in South-West Africa.

March 20 : **United Kingdom-India**.—A new trade agreement was signed.

Palestine.—The National Council of Palestine Jews called a general strike as a protest against the British government's proposals for governing Palestine.

March 21 : **British Empire**.—Pledges of co-operation in maintaining the solidarity of the British Empire were given by Canada and Australia. In South Africa many recruits joined the Defence Force.

Palestine.—The Report of the British and Arab Committee on the McMahon Correspondence was published.

March 26 : **India**.—The Punjab government introduced a five-year programme to stamp out illiteracy in the province.

March 29 : **United Kingdom**.—Large prospective increases in the strength of the Territorial army were announced.

Australia.—The cabinet decided to undertake a compulsory national register of men between 15 and 64 years of age, and a voluntary register of women.

March 30 : **India**.—The Council of State passed a resolution approving the Indo-British Trade Agreement.

March 31 : **United Kingdom**.—Britain and France promised full support for Poland in the event of violation of her territorial integrity.

April 4 : **South Africa**.—In the greatest trial ever held in the Union, 458 native women were found guilty of murder by stoning a man to death.

April 7 : **Australia**.—Following the sudden death of Mr. Lyons, Sir Earle Page was appointed interim prime minister.

April 8 : **United Kingdom-United States**.—A 50-year agreement for the joint use of the Phoenix Islands was reached.

April 10 : **Palestine**.—Five British soldiers were killed by a land mine on the railway near Lydda.

April 13 : **Palestine**.—The Arab terrorists'

leader Aref Abdul Razzik surrendered to British troops.

April 14: **British Empire.**—A conference between Britain, New Zealand and Australia on defence in the Pacific Ocean was opened at Wellington, New Zealand.

April 15: **India.**—The Central Legislature rejected the Tariff bill embodying the terms of the Indo-British Trade Agreement.

April 17: **South-West Africa.**—In view of the international situation armed police reinforcements arrived from Pretoria.

April 18: **India.**—The Council of State passed the Tariff bill a second time.

April 19: **South Africa.**—A bill to incorporate police of South-West Africa with the Dominion force was supported by the House of Assembly.

Kenya.—The immigration authorities were empowered to demand a maximum bond of £500 from immigrants unable to return to their own countries.

April 21: **British Empire.**—Defence measures were announced for Southern Rhodesia, Kenya, Tanganyika, and Malaya.

April 22: **New Zealand.**—Drastic restrictions were imposed on imports in order to conserve the government's foreign exchange.

April 24: **Australia.**—Mr. Menzies, elected as Mr. Lyon's successor, formed a cabinet of members of the United Australia Party.

April 26: **United Kingdom.**—The government's plan for compulsory military service was announced in the House of Commons.

April 27: **Australia.**—The Federal government announced the creation of legations in Tokyo and Washington.

May 1: **United Kingdom.**—The texts of the government's Military Training and Reserve and Auxiliary Forces bills were published.

May 6: **United Kingdom.**—The King and Queen left England on an official visit to Canada and the United States.

May 8: **South Africa.**—Voluntary enrolment for the National Reserve began.

Malta.—A new British Institute was opened.

May 12: **United Kingdom.**—Mr. Chamberlain announced a pact of mutual assistance between the British and Turkish governments.

May 13: **United Kingdom.**—Bomb explosions, attributed to the I.R.A., occurred in London subways.

May 14: **United Kingdom.**—The B.B.C.'s first weekly news bulletin in Afrikaans was broadcast, and clearly heard in Capetown.

May 15: **South Africa.**—A supplementary barter trade agreement between the Union and Germany was signed at Capetown.

May 16: **Malaya.**—Substantial contributions to the cost of Imperial defence were made by a number of States.

Transjordan.—The British government agreed in principle to certain measures of constitutional reform.

May 17: **Canada.**—The King and Queen arrived at Quebec.

Eire.—Mr. De Valera protested against the conscription of Irishmen in Britain.

May 22: **Palestine.**—The British government issued its own proposals for the future government of Palestine in a White Paper.

New Zealand.—The prime minister

stated that if Britain were involved in a general war New Zealand would not stand apart.

Palestine.—Protests were made against the proposed abolition of the Balfour Declaration and a permanent minority status for Jews in Palestine.

May 23: **Palestine.**—The new plan as set forth in the White Paper was approved by parliament.

May 24: **Southern Rhodesia.**—The Otto Beit bridge over the Zambesi at Chirundu was opened.

May 25: **South Africa.**—Subscription lists for a £5,000,000 defence loan were opened, and closed on the same day.

May 27: **United Kingdom.**—New Anglo-French proposals for mutual defence by Great Britain, France, and the Soviet Union against aggression were delivered to the Soviet government.

May 29: **India.**—Settlements were made with the most influential tribes of the North-West frontier.

Burma.—The cabinet resigned, following the lead of the minister of commerce, who refused to resign when asked by the prime minister to do so.

May 30: **Australia.**—Refugee Jews in Western Australia asked for protection from Nazi interference.

Burma.—A new cabinet was sworn in, but with the same members as before except for the minister of commerce.

May 31: **Eire.**—Bill to suppress I.R.A. activities passed.

Palestine.—The Arab Higher Committee rejected the White Paper.

June 1: **United Kingdom.**—The submarine "Thetis" met with disaster, 99 men losing their lives.

The Soviet government replied to the Anglo-French proposals of May 27.

Australia.—A Department of Supply was created.

June 3: **United Kingdom.**—The first registration of men of 20-21 under the Military Training Act took place.

June 5: **India.**—The Indian Naval Reserve Forces Discipline Act was promulgated whereby four sections of reserves were created.

June 7: **Australia.**—A new sterling loan was issued to meet part of the defence expenditure.

British Empire.—The King and Queen arrived in the United States.

June 13: **Palestine.**—Ten bombs exploded at Tel Aviv.

The report of the Mandatory Power was placed before the League Mandates Commission.

June 15: **Palestine.**—Mr. MacDonald reviewed the situation and British policy in a speech to the Mandates Commission.

Canada.—The King and Queen sailed from Halifax for England.

June 17: **Burma.**—A commission was set up to enquire into alleged Indian penetration.

June 19: **India.**—Hindu-Moslem riots occurred at Cawnpore.

Palestine.—The disturbances continued; 18 Arabs were killed in a bomb explosion at Haifa.

June 23: **United Kingdom.**—A barter agreement was signed in London between the British and United States governments.

Eire.—The government denounced the Irish Republican Army as an unlawful organization.

July 1: **India.**—An Act for the registration of foreigners came into force.

July 2: **Canada.**—As from Sept. 24 the

Canadian Broadcasting Corporation proposed to assume control of all wireless broadcasting.

Australia.—The prime minister announced that in its international policy Australia stood with Britain, even if it were a question of war.

July 3: **Canada.**—The Social Credit Party merged with the New Democracy Movement under the combined name of the New Democracy Movement.

July 6: **Canada.**—The government disapproved of a proposed barter deal between Germany and Manitoba Province.

July 12: **Palestine.**—Immigration quota was suspended for 6 months owing to illegal immigration.

United Kingdom.—Agreements were signed in London whereby Greece and Rumania should make big purchases of British goods with the aid of guaranteed credits.

July 15: **United Kingdom.**—The first 34,000 militiamen commenced training.

July 17: **Palestine.**—Jewish protests against the suspension of immigration continued.

India.—Political and religious reforms for Hyderabad were announced.

July 20: **New Zealand.**—Britain granted credits for £9 million to finance imports from the mother country.

July 27: **United Kingdom.**—Further bomb explosions attributed to the I.R.A. occurred in London.

New Zealand.—A government conversion loan for £16 million was negotiated.

July 28: **United Kingdom.**—As Prevention of Violence Act became law, expulsion orders against 19 I.R.A. suspects were signed.

July 31: **British Empire.**—Troops were dispatched from India to Egypt and Malaya.

Aug. 1: **India.**—Prohibition of all alcoholic liquor began in Bombay.

New Zealand.—A state iron and steel industry was initiated.

South Africa.—The Union government began administration of the eastern portion of Caprivi Zipfel.

Aug. 10: **New Zealand.**—Trade talks with Canada began.

Aug. 14: **India.**—The Congress, Bombay, decided to boycott the Legislative Assembly during the coming session.

Kenya.—The British government promised a loan of £250,000 for the establishment of British settlers.

Aug. 16: **Palestine.**—The 21st Zionist Congress opened at Geneva.

Aug. 17: **Palestine.**—The Permanent Mandates Commission of the League of Nations maintained that the policy of the British White Paper was not in accordance with their interpretation of the Palestine mandate.

Aug. 18: **India.**—The R.A.F. bombed the headquarters of the Faquir of Ipi near Kharre.

Aug. 19: **South Africa.**—The German trade and payments agreement was renewed for one year as from Sept. 1. Purchases were fixed at £6,355,000.

Aug. 22: **Canada.**—The air transport agreement between Canada and the U.S.A. was concluded.

Kenya.—Government enquiries were opened at Mombasa and at Tanga into the causes of recent native labour unrest.

Aug. 23: **India.**—Tribal fighting continued on North-west frontier.

Aug. 24: **United Kingdom.**—The Emergency Powers (Defence) bill was passed

through all its stages, and received the royal assent.

Aug. 25 : **United Kingdom**.—The Anglo-Polish Agreement of Mutual Assistance was signed in London.

Aug. 26 : **United Kingdom**.—Sir Nevile Henderson arrived from Berlin with Herr Hitler's reply to a British Note.

Aug. 28 : **United Kingdom**.—Sir Nevile Henderson flew to Berlin with the reply to Herr Hitler's Note.

Aug. 30 : **Canada**.—A trade agreement was concluded with Turkey.

The British Government purchased 5 million bushels of wheat, part to be stored in Canada.

Aug. 31 : **United Kingdom**.—The evacuation of over 3 million children and adults from London and other crowded areas began.

Air services to the continent were suspended.

Sept. 1 : **United Kingdom**.—Following the invasion of Poland by German troops, the King signed an order for complete mobilization of the army, navy and air force.

Sept. 2 : **Eire**.—Mr. De Valera announced that Eire would maintain neutrality in the present European conflict.

Sept. 3 : **British Empire**.—Britain, Australia, New Zealand and Canada declared war on Germany, France having declared war on the same day.

A special war cabinet was formed in London.

Sept. 4 : **South Africa**.—General Hertzog's pronouncement of the neutrality of the Union in the war led to his defeat by 80 votes to 67.

India.—The government offered £34 million towards modernizing the defence force.

Sept. 6 : **South Africa**.—Following General Hertzog's defeat, General Smuts formed a war cabinet. War was declared on Germany.

Sept. 7 : **Australia**.—The entire militia force was called up for training.

Sept. 11 : **Australia**.—A special war cabinet was formed.

Sept. 12 : **Great Britain**.—The safe arrival of British troops and units of the R.A.F. in France was announced.

Sept. 15 : **New Zealand**.—Great Britain undertook the purchase of all surplus butter, cheese, meat, and wool.

Sept. 19 : **South Africa**.—All suspected aliens were interned at Bavianspoort.

Sept. 20 : **Australia**.—The government offered Great Britain the complete personnel of six squadrons for overseas service in 1939.

Sept. 21 : **Southern Rhodesia**.—Recruiting offices were closed, the supply of volunteers having exceeded the demand.

India.—One hundred and forty-one Indian princes offered their services to the King-Emperor, some offering troops, others gifts of money.

Sept. 22 : **British Empire**.—The King thanked the Sultan of Zanzibar, the Federated Malay States, and Kenya for offers of support.

Sept. 24 : **New Zealand**.—A division was offered for service overseas.

Sept. 25 : **Southern Rhodesia**.—The export of live cattle was forbidden in order to make available the maximum supplies of frozen meat for Britain.

South Africa.—A "South African Mayors' National Fund" was launched to raise at least £1 million for the pur-

chase of foodstuffs, etc., to be presented to the Allies.

Sept. 28 : **Canada**.—A war committee of the cabinet was created.

Sept. 29 : **India**.—The Aga Khan informed his followers throughout the world that it was their duty to co-operate in the service of the King-Emperor.

Bahrain.—The Sheikh of Bahrain offered £30,000 towards the cost of the war, as he had no army to offer.

Sept. 30 : **Australia**.—Sales to Great Britain of all surplus wool, meat, dried fruit, eggs, cheese, and sugar were arranged.

Oct. 1 : **South Africa**.—The formation of a South African Irish Regiment was sanctioned.

Oct. 4 : **New Zealand**.—A battalion of Maoris was formed for home or overseas service.

Oct. 5 : **Australia**.—The Commonwealth treasurer was empowered to acquire foreign securities owned by Australians and other property abroad.

Oct. 6 : **New Zealand**.—The government was given full control over currency and credit and authorized to acquire and handle all surplus produce.

Oct. 10 : **Burma**.—A defence council was set up.

Oct. 11 : **India**.—A volunteer scheme for the regular Indian army was introduced.

Oct. 15 : **Canada**.—The British air mission, headed by Lord Riverdale, arrived in Ottawa.

Oct. 16 : **New Zealand**.—Men enrolled in the national military reserve totalled over 35,000.

Oct. 17 : **India**.—The Viceroy reaffirmed British government's view that dominion status achieved by constitutional changes was India's natural destiny.

Oct. 18 : **India**.—Congress leaders expressed dissatisfaction with the viceroy's statement.

Oct. 19 : **Great Britain**.—The Anglo-French treaty with Turkey was signed in Ankara.

Oct. 24 : **Kenya**.—Austrian and German refugees volunteered in military and other capacities.

Southern Rhodesia.—The government offered to maintain three air squadrons in the field.

Oct. 28 : **Canada**.—Contracts were signed for the supply to Great Britain of 420 million lb. of electrolytic copper, to be delivered within 12 months.

Oct. 30 : **South Africa**.—A Foreign Legion was established following many offers by aliens to serve in the forces.

India.—Several Congress ministers resigned.

Oct. 31 : **British Empire**.—Discussions on Empire co-operation began in London between cabinet ministers and Dominion ministers.

India.—The creation of a permanent Indian air force volunteer reserve was authorized.

Nov. 1 : **Kenya**.—The governors of the East African territories and of Nyasaland and Northern Rhodesia, and the resident of Zanzibar, met in Nairobi to discuss their own defence and the help to be given to the Empire.

Nov. 6 : **Canada**.—Delegates from Australia, Canada, New Zealand, and Great Britain met at Ottawa to discuss Empire air training.

Nov. 8 : **Burma**.—In reply to a communication of Oct. 12, the British government reaffirmed its intention to

assist Burma to attain her due place in the Commonwealth of Nations.

New Zealand.—The Centenary Exhibition was opened at Wellington.

Nov. 11 : **Palestine**.—An improvement in the general security of the country led to the release of a large number of Arabs in time to celebrate Id el Fitr.

Nov. 13 : **South Africa**.—A South African seaward defence force was created.

Canada.—By an order-in-council the rate of sterling for duty purposes was lowered from its parity of \$4.86 to a selling rate of sterling daily declared by the Foreign Exchange Control Board; a concession about equivalent to a 9 per cent reduction in Customs duties.

Nov. 15 : **India**.—The Assam ministry resigned, thus completing the resignation of all the Congress ministries in the eight provinces of British India.

Newfoundland.—A very successful response was reported for recruiting for the Royal navy.

Nov. 17 : **India**.—Budshah Gul, the Mohmand leader, advised his followers to co-operate whole-heartedly with the British.

Nov. 19 : **British Empire**.—Gifts of money were made by Trinidad, Barbados, and Sarawak to the British government.

Nov. 22 : **Cyprus**.—2,000 Cypriots volunteered for service with the British forces.

Canada.—65,000 troops were declared mobilized.

Dec. 5 : **Eire**.—The creation of a new marine service costing £250,000 was announced.

Dec. 9 : **Canada**.—The Royal Canadian air force announced 6,500 applications since September.

Dec. 15 : **Australia**.—Australia offered 26,000 men for the Empire air training scheme.

Dec. 17 : **Canada**.—Representatives of Great Britain, Australia, Canada, and New Zealand signed the agreement for the Empire air scheme in Ottawa.

The first contingent of Canadian forces landed in Britain.

Dec. 19 : **Aden**.—A contraband control base was established at Aden.

Dec. 20 : **British West Indies**.—An order-in-council fixed Jan. 1, 1940, as the date for the transfer of Dominica from the Leeward Islands group to the Windward Islands group as a separate colony.

Australia.—The prime minister, in a national broadcast service, emphasized that Australia would only leave the war as victors.

South Africa.—The offices of several German organizations were raided and large quantities of documents seized.

Dec. 22 : **Canada**.—The British ministry of food arranged to purchase from Canada an average weekly amount of 5,600,000 lb. of Canadian bacon and hams.

India.—The day was observed by Moslems as one of "deliverance," and as "a mark of relief that the Congress governments have at last ceased to function."

Dec. 26 : **Australia**.—The first contingent of Australian troops arrived in England.

Dec. 27 : **India**.—The first Indian contingent arrived in France for service on the Western Front.

Dec. 28 : **Kenya**.—The war office in London assumed complete financial responsibility (as from Sept. 1, 1939) for all military expenditure during the war throughout East Africa.

AIR RAID PRECAUTIONS

AIR RAID PRECAUTIONS. The vital importance of civil defence in modern warfare, so vividly demonstrated in the attacks on Abyssinia, Spain, China, Poland, and Finland, was recognized in a practical form by Britain in 1937, by the passing of the Air Raid Precautions Act. The events of 1938 intensified preparations; a ministry of civil defence was established, gas masks were issued, trenches dug, and the nucleus of an A.R.P. service enlisted. Early 1939 saw further significant developments.

Shelters. A major consideration has been the provision of some adequate light-bomb, blast-, and splinter-proof shelter scheme. The compulsory provision of air raid shelters is regulated by the Civil Defence Act 1939. They are of three main categories, namely, public shelters provided by the local authorities, private shelters by the owners of factories, mines, and commercial buildings, and private shelters by public utility undertakings.

The local authorities are under an obligation to construct public shelters for persons who may be caught in the street during an air raid, the number for whom provision is made varying from ten to fifteen per cent of the normal population of the area. Such shelters usually take the form either of specially constructed brick or concrete chambers above or below ground, or partly both, or else of existing buildings or portions thereof, adapted and strengthened. Of the public shelters good examples are to be seen in parks where light-bomb resisting trench-shelters of reinforced concrete are built below ground, use being made of the tamping effect of the soil. In streets where houses are of very light construction, medium sized above-ground brick shelters have been built in closely populated areas and in busy shopping centres. Where they exist basements have been utilized and strutted or otherwise strengthened where a floor above suffices to enable them to withstand a debris load.

The Home Office has issued memoranda to deal with almost every reasonable situation, giving general rules and specifications that the builder can follow. Sanitary accommodation and emergency lighting are catered for, and providing that the local authorities have tackled this responsibility seriously, reasonable shelter accommodation should be afforded for the best part of the working and shopping communities.

The local authorities are also responsible for the provision of shelters at or near their homes, for those citizens whose family incomes do not exceed £250 per annum. These sometimes take the form of steel sectional shelters known as "Anderson" shelters and so named after the minister of home security. They afford protection for six persons and are suitable for small houses or villas with gardens.

Where such steel shelters are not suitable brick or concrete communal shelters are constructed or the actual houses themselves are strengthened.

Many thousands of Anderson shelters have been delivered free to the poorer people who have asked for them. The shelter problem has been given a great deal of attention, but largely through inexpert choice of ground or of the most suitable kind of shelter, water and dampness have made a proportion of the shelters unsatisfactory. This is being remedied by the local authorities, though in some cases only after considerable delay.

In certain specified areas, *i.e.* those in which air attack is likely to be most severe, the owners of all factories, mines,

and commercial buildings in which more than fifty persons work, are required to provide shelters conforming to a prescribed standard. Such owners receive a grant from public funds in respect of approved capital expenditure of an amount in the pound equal to the standard rate of income-tax for the year 1939-40.

All public utility undertakers, including such services as gas, electricity, water, railways, docks and harbours, etc., have the duty of taking such measures as may be necessary to ensure the proper functioning of these services during air raids and of providing shelter and such special protection or equipment as may be necessary for their staffs. For expenditure on such matters the undertakers will receive certain grants from public funds.

In the case of blocks of flats, the owner must, if requested by a majority of its tenants, provide air raid shelter for them, but is entitled to recoup himself by increasing rents on a specific basis. Where, however, the majority of the tenants are of the class who would be entitled to free materials for air raid shelters (*i.e.* of the income class before referred to) then the local authority may construct the shelter at the public expense.

Legislation. The Civil Defence Bill referred to above was introduced by Sir John Anderson on March 23, 1939, and was intended to increase the country's preparedness to meet air attacks. It conferred on local authorities the right to enter private premises in order to carry out A.R.P. work and to acquire land for shelters. It imposed upon employers the obligation of providing protection for their workpeople, and also provided for the incorporation in new buildings of structural precautions and air raid shelter. It allowed for a fifty per cent grant for public utility services towards the cost of special A.R.P. provision to ensure these services functioning in war time. It imposed camouflaging and darkening regulations, arranged for evacuation of women and children where advisable, and generally tackled A.R.P. problems to compete with large-scale and frequent air attack.

The shelter and material provision has been a very costly business but a very necessary one.

Personnel. The A.R.P. personnel has been made up mainly of: fire-fighters; rescue and decontamination squads; stretcher bearers; ambulance staff; air raid wardens; repair parties; control and reporting personnel; despatch riders; and extra police. In addition there are numerous civil engineers and other skilled technicians who have made preparation for dealing with the possible damage to water mains, gas, and electric installations.

Well over a million people are enrolled in civil defence. Many who can afford it are giving full-time voluntary service—among them women and girls who drive cars, lorries, and ambulances, cater for those on guard, work telephones, serve in canteens, and so on. A great number of other women, less well placed financially, receive a salary as A.R.P. workers of £2 a week.

The men employed in this great organization come from every rank and grade and also include both volunteers and paid workers, a man's salary on A.R.P. work being £3 a week. Many of the older men are manning wardens' posts or engaged in night patrol. Senior Scouts and Rovers are likewise rendering valuable service.

Since A.R.P. has been taken in hand seriously great efforts have been made to exercise the personnel, and in some regions these emergency services have attained a high

standard of proficiency. The fire brigade exercises alone have reached a scale hitherto undreamed of, and it is no unusual thing to see the London Fire Brigade employing five hundred pumps at once.

The ambulance and stretcher-party workers are exercised almost daily, and their training has been well carried out. In this connexion large lorries, suitably selected, and in some cases motor-omnibuses, have been converted into what are known as mobile hospital units. It takes little more than five minutes from the time of arrival of one of these vehicles with a complement of a doctor and half a dozen nurses to improvise a small hospital in a hall, house, or even in the open. The staff are prepared to carry out amputations and other operations if the need should arise. The medical services have responded admirably, and enthusiasm and energy have been put into the training of first-aid personnel.

The air raid wardens have generally taken great trouble to make themselves efficient. Wardens' posts, which should be blast and splinter proof, have been built according to special standards all over the country, and rendezvous have been selected and their positions made generally known so that rescue and first-aid parties can reach them at short notice, and be conducted to the scene of the bombing without delay.

The training of rescue and decontamination squads has reached a high standard. This includes rescuing people buried under heavy debris or from the topmost storeys of high buildings, cutting through steel girders, clearing roads of smashed up and overturned vehicles, and decontaminating large areas after poison-gas raids, in addition to cleansing the personnel itself. Decontamination stations are provided where they are considered necessary.

In addition to the foregoing, squads have been trained and are kept in readiness to deal with electrical, gas, and water breakdowns up to the largest imaginable scale. Sluice gates have been provided where underground railways pass below rivers, and never in any nation's history has so much attention been given to this vital civil defence problem.

Everyone in the country has been given a respirator and a serious appeal has been made to the public to carry their gas masks always. The response has not been as good as it should be.

In conclusion, the control and reporting centres should certainly be mentioned. Such a network of control has been built up that it is believed that in the worst breakdown conceivable communication can be maintained, and that no air attack, however large the scale, can be carried out without all available resources being rushed to the centre of damage in the minimum of time.

ECONOMIC WARFARE. On Sept. 5 an order in Council (S.R. & O. 1939, 1188) based on the Ministers of the Crown (Emergency Appointments) Act established a ministry of economic warfare, which, as the official statement explained, corresponded broadly to the ministry of blockade set up during the last war. Mr. R. H. Cross, the former parliamentary under-secretary to the Board of Trade, was appointed minister. Sir F. Leith Ross, the chief economic adviser to the government, was made director general, and Sir G. Mounsey, of the Foreign Office, secretary to the ministry.

Within a few days of the outbreak of the war the ministry was at full work, staffed mainly by experts drawn from

business life. In this field the lesson of the last war had not been forgotten. The vital task of denying essential supplies to the enemy was not, as at the beginning of that war, entrusted to a section of the Foreign Office advised by a committee of experts and working through various executive departments. It was recognized that this task was basically different, indeed in certain respects opposed to that of the Foreign Office, whose chief duty is to maintain friendly relations with neutral powers. Close co-operation was immediately established between the ministry and its counterpart in France and all measures taken carefully synchronized.

Contraband Control of German Imports. The proclamation specifying the goods which would be treated as contraband was ready on Sept. 3. It followed closely the precedent established by the regulations laid down by the United States government in the last war, when the Declaration of Paris of 1856 and the London Declaration of 1909 were abandoned. This was a very important advantage, since in 1914 the self-denying acceptance of the London Declaration—though it had not been ratified—for some time prevented the Powers of the Triple Entente from impeding even vital supplies to Germany.

The first list of firms deemed to be enemies under the Trading with the Enemy Act was also issued almost immediately. Further lists followed. The unrivalled facilities of the City of London as traders and bankers were placed at the government's disposal for securing information on the operations of other firms which might be tempted by high profits to supply goods to the enemy.

At Kirkwall, Weymouth, the North Foreland, Gibraltar, and Haifa control bases were set up by the Admiralty. The cargo manifests of all ships passing through to neutral ports in territories directly or indirectly contiguous to Germany are examined by the ministry of economic warfare. If a cargo should prove suspicious the case is brought before the Contraband Committee, a semi-judicial body, which examines whether a *prima facie* case has been made out by the department justifying its detention. Finally the prize courts set up under royal patent decide whether the goods and ships are liable to seizure or not.

In order to avoid the long delays, inevitable early in the war, as almost each case presented complex problems, the system of "Letters of assurance" (navicert) was reintroduced in Nov. 1939. Prospective shippers of goods to countries contiguous to Germany submit their plans in advance to British consuls overseas who then issue certificates. Ships covered by certificates are not held up in the contraband control bases. By this means and by the gradual enlargement of the staff of the ministry, unnecessary frictions with neutral countries are slowly being eliminated.

Contraband Control of German Exports. Early in the war no action was taken with respect to German exports, though an analogous policy in the beginning of the last war seriously weakened the effectiveness of economic warfare. But in retaliation to the continued and increasingly flagrant disregard by the Nazi government of international law at sea, manifested by the sinking of merchant ships without warning, air attacks on merchant vessels and the sowing of "magnetic" mines, an Order in Council was issued (effective Dec. 4) ordering the confiscation of all German exports seized on the high-seas. It appears that the Nazis are trying to evade this further blow at their capacity to acquire directly or indirectly foreign supplies. The minister of economic warfare stated in the House of Commons on Jan. 16, 1940, that the Order

itself was sufficient to throttle a greater part of Germany's exports overseas. It will be applied with increasing efficacy, though in certain exceptional cases specified shipments essential to neutrals overseas will be permitted to pass.

Special measures are also being taken to prevent Germany from using her financial resources for replenishing her supplies, and a special department was created for the purpose, working in close co-ordination with the powerful financial organizations in Allied countries.

Negotiations with Neutral Countries. To stop the loopholes by which essential war supplies are reaching Germany, information and statistical material regarding adjacent neutral countries are being accumulated. There seems to be no need for the establishment of special trading organizations such as, *e.g.*, the Netherlands Overseas Trust in Holland and the *Société de Surveillance Economique* in Switzerland. The foreign trade of neutral countries is to a far greater degree under direct government control than in the first period of the last war. Thus direct agreements similar to those negotiated in 1918 with the governments concerned will probably suffice.

Factors of assistance in this collection of information are the widespread business organizations of Britain and its Allies. The ministry can also draw on more direct sources, among which the statistics based on ships' manifests are perhaps the most important. As time passes these trade statistics will give an increasingly accurate picture of the position of all materials imported from overseas into the "controlled area" adjoining Germany. Thus the discontinuation of the publication of official trade statistics need not hamper the British authorities in the execution of their task. The production of this "controlled area" is, of course, not covered by these figures, but it will probably be possible to obtain fairly accurate information about it either by agreement and/or on the basis of the import figures, as there are few products whose production or manufacture does not demand overseas supplies. The bargaining power inherent in the command over the sea routes should also be of material assistance.

Negotiations with neutral countries adjacent to Germany were started soon after the outbreak of war. Agreements were concluded with several of them—*e.g.* Italy, Sweden—after long discussions. In other cases conversations still continue. The text of these agreements has not been published. It is understood that in certain cases the agreement included a regulation of trading between the neutral country and the Allies. The rate of exchange between the national currency of the neutral and sterling as well as francs was fixed. Provision was made also for the payment for purchases by the Allies in the neutral country partly by gold and free foreign exchange, partly in sterling (francs) to be expended within the confines of the British and French Empires—except those parts which belong to the dollar block. It is not known whether and on what basis imports from overseas of essential war-materials and food-stuffs likely to be of utmost use to Germany into contiguous and quasi-contiguous countries are now regulated.

Rations imposed on these countries during the last war were usually equal to pre-war imports less exports and any increase of the production of the product as had occurred during the war. Special attention was at that time paid to commodities which were imported into the contiguous neutral country not for the purpose of consumption but for processing, manufacture, and re-export.

The agreements prevented the re-exports from taking an undesired direction.

It seems that—at any rate in certain cases—the present intention is to fix import quotas for these countries by negotiation. This procedure has serious drawbacks. Its operation is not mechanical and therefore may lead to friction not only between foreign countries and the Allies, but also between the government departments entrusted with the execution of different aspects of policy. It is to be feared therefore that these agreements may err on the side of too great a leniency. There is the added complication at present that the pre-war statistics of foreign trade could hardly provide an adequate basis for the interception of essential supplies to Germany. Apart from the technical progress which shortens the time necessary to readjust the economic structure of a country to the loss of supplies (and in most cases decreases the loss suffered thereby) the choice of a base period is most difficult. The pre-1914 figures were characteristic for peace economics, and also gave an adequate picture of potential productive capacity, but statistics concerning the last few years are deficient in both directions. The world has gone through a period of continuous and severe economic instability, not merely since 1929 but, if the consequences of economic nationalism, or autarchy, are to be taken into account, ever since 1914. Hence some arbitrariness in fixing rations cannot be avoided.

Future Policy. What then are the prospects for the future? The most important difference as compared with 1914 lies in the fact that Germany has systematically prepared her economic structure against "economic blockade", and accumulated very considerable stocks of essential raw materials, foodstuffs, and finished military and civilian supplies, partly by enforced collective saving, partly by looting the countries she overran. The Austrian, and Czech gold and foreign exchange reserves, which were handed over *in toto* or partially to the Nazis by the two Western Powers, represent merely a portion, though a valuable portion of this loot. Germany undoubtedly possesses very much less foreign assets including gold than in 1914, but whereas Imperial Germany never used her reserves fully the Nazis have not only utilized them but are increasing them by various devious methods (repatriation of Germans, demand for payment on pre-1914 loans, etc.). They have, furthermore, introduced a draconic control of consumption and foreign trade, so that the wastage of raw materials and foreign assets which occurred in 1914 and 1915 will not be repeated. On the contrary, the Nazis have an exact knowledge of, and power over, all stocks of vital supplies now in Germany. Nor are they so cut off, as was Imperial Germany from all important sources of supply though they lack the domination of the iron and coal supplies of France and Belgium. They have assiduously cultivated trade with the areas which they hoped to be able to reach even in case of war. The overvaluation of the Reichsmark relative to the so-called "free currencies" in these countries, which made it profitable for them to sell to Germany, coupled with clearing agreements which forced them to expend the proceeds of their exports in Germany, has tended to adapt the productive structure of these countries to Nazi needs. At the same time in the crucial period after 1931, Britain and France, for different reasons, both indulged in prohibitive measures such as quotas, the Ottawa system of preferential tariffs, etc., against the main exports of exactly these countries.

A diversion of supplies from the Nazis would therefore

involve competitive selling of manufactures now obtained by the contiguous countries in Germany, and competitive bidding for supplies now sold to Germany. In so far as the overvaluation of the mark continues and the Nazis use their control over economic life to sell and buy in these countries regardless of cost this cannot be accomplished by private enterprise of the Allied countries, as the transactions would result in a loss to the British trader. Yet the necessity for such active economic warfare is plainly shown by the fact that almost one half of Germany's total trade immediately prior to the war was conducted with countries to which she has direct access. If trade between the Soviet and the Nazis should regain its former importance, a possible though not—on account of transport difficulties and the increased internal demands of Russia—a probable contingency, the proportion of trade which the Nazis could theoretically maintain in spite of naval or military measures of the Allies rises to some sixty per cent of pre-war. It is true, of course, that part of the trade which Germany has conducted with neighbouring countries represents trans-shipments from overseas reaching the Nazis through neutrals (*e.g.* Holland and Belgium) which will be stopped by measures of the Allies. On the other hand the Nazis can redirect their exports to overseas countries to contiguous countries and thus obtain more of the production of these countries.

Whilst such redirection of the export trade could solve the import problem of Germany if she could obtain the total production of such countries, as far as food supplies are concerned (with the possible but not certain exception of fats), it cannot bridge the gap without overseas supplies in petrol, certain rare metals, textile fibres, and rubber. The 1938 figures of German imports include, however, very considerable supplies not needed for current consumption but for the building up of stocks, and the consumption of certain goods could be forced even below the low standard which obtained in Germany throughout the pre-war period. Moreover, there are considerable idle resources of labour in most of the neighbouring countries, and given efficient reorganization their productivity could also substantially be increased. Hence the possible alleviation of the shortage of materials suffered by the Nazis by an increase of imports from such countries may be considerable.

These considerations suggest that the interception of enemy supplies from overseas must be vigorously supplemented by active economic warfare—*i.e.* both selling against Germany and buying up supplies she needs, in neighbouring countries, if quick results are to be obtained. Furthermore, German stocks are not being exhausted and German productive power is not being encroached upon at present in a way corresponding to 1914-18. Available labour force is not being depleted by casualties, and there is no wastage of material in active hostilities. The considerable rise in German exports to neighbouring countries at favourable prices does not altogether bear out the contention that all that is possible to do in this respect has already been accomplished by the Allies. Fortunately most of these neutrals used the proceeds of German exports to reduce their earlier credits to Germany. If they do not obtain the products they need from the Allies they will, however, soon be forced to sell to Germany.

A policy of active economic warfare would inevitably involve a worsening of the Allied terms of trade already burdened by the war effort. The Allies must, therefore, if they wish to avoid the premature exhaustion of their gold and other foreign reserves, however great they may be,

take active measures to improve their terms of trade with the rest of the world. It also implies a readiness and capacity to sell products of which Germany is a potential supply, and often at "uneconomic" prices. This in its turn will depend on the successful mobilization of the potential productive capacity of the Allies and its efficient use in foreign trade (an undervaluation of the mark relative to sterling and the franc would very much facilitate this endeavour). It would probably also involve a limitation of the Allies' civilian consumption. Moreover, to stop German supplies the Allies must be prepared to promise effective military aid to the neutrals adjacent to the Nazis, for otherwise they will not dare to refuse German dictates. This postulates a decided superiority in striking force, which must be crushing, because the Nazis once more possess the advantages (as they suffer from the drawbacks—*i.e.* the possibility of cutting their communications with overseas) of being able to move their forces along the shorter central routes. Thus the waging of a successful active economic warfare depends on the whole system of economic war policies and their co-ordination. (*See* INDUSTRY, WAR CONTROL OF; also WAR FINANCE; and WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES.) (T. BA.)

EMERGENCY LEGISLATION. When a state of emergency arises in a constitutional country such as Great Britain the procedure and the powers normally vested in the executive may be quite inadequate. This was so at the outbreak of the war. New laws and new powers became necessary, and citizens, as a whole, were ready to give up many of their cherished rights in order that the executive might be vested with full powers, so as to bring the war to a successful conclusion.

On Sept. 3, 1939, His Majesty's government was well prepared in this respect. A vast body of legislation, statutes, rules, orders, and regulations was already prepared in draft form for presentation to parliament. During the period from Sept. 1 to Dec. 14, 1939, about sixty Acts were passed, and about eight hundred rules, regulations, and orders made, which have profoundly affected nearly every aspect of national life. It is almost impossible to give any adequate description of their range and power, but some idea may be gained when it is realized that they affect agriculture, industry, commerce, civil defence, copyright and patents, the law courts, the administration of justice, education, customs and excise, employment, insurance, landlord and tenant, local government, finance, pensions, police and firemen, road and rail traffic, shipping, and air navigation.

Procedure. His Majesty the King, with the advice of his Privy Council, can now make Orders in Council and Proclamations which have the force of law. As it is impossible to legislate for every detail of an emergency, parliament frequently delegates its powers in certain cases to ministers of the Crown and to officials, giving the respective minister official full powers to make regulations or orders which have the power of law.

The general effect of this legislation on industry and commerce, civilians, the constitution, public authorities, and the armed forces, can be best considered by dealing with these phases separately.

Industry and Commerce. *The Civil Defence Act 1939* amended the *Air Raid Precautions Act 1937* and they should be read together. By these Acts local authorities are compelled to make schemes for the protection of persons and property from hostile air attack. Basements may be

commandeered for use as public air raid shelters. If necessary, the Crown will supply materials for the strengthening of such basements, but the local authority must carry out the necessary fixing. Owners of factories, mines, and public utility undertakings are under a duty to screen all lights and to regulate flames or glare, and, if necessary, to camouflage their buildings. They may receive a grant towards the cost but such grant must not exceed one half of the expenses. Premises or vehicles may be requisitioned and land may be compulsorily hired for civil defence. Where orders are made for the requisition of premises or vehicles, or which relate to local authorities in London, they must be laid before parliament. The same applies to any Treasury scheme made under the Act, and if parliament resolves that such order, regulation, or scheme should be annulled, then it will be void.

The Compensation (Defence) Act 1939 provides for the payment of compensation to those who own property which has been temporarily possessed or controlled by the government in the exercise of emergency powers. No provision is made for the loss of goodwill of trade, profession, or business caused through the taking or controlling of premises or land, nor for deterioration or loss incurred where movable assets have had to be moved in pursuance of emergency powers, although a claim may be made for expenses actually incurred through carrying out orders.

The Finance (No. 2) Act 1939 reintroduced the excess profits tax. The tax is chargeable on the excess of profits made over the standard profits during a chargeable accounting period. The standard profit is computed by reference to (1) a minimum amount; (2) profits of a standard period; or (3) the statutory percentage of the average amount of capital employed in the business. The tax, which is three-fifths of the excess profits, is payable one month after assessment, and applies to all trades or businesses of any description carried on in the United Kingdom or abroad, personally or through an agent, by persons ordinarily resident in the United Kingdom. The national defence contribution is a duty imposed by the Finance Act 1937 for a period of five years from April 1, 1937. It is chargeable on a percentage of the profits of a business, whether or not there is an excess. Whichever is the higher is payable, but if both are equal, then excess profits duty is payable. The national defence contribution is a tax of five per cent of profits in the case of a body corporate, and four per cent of the profits in any other case.

The War Risks Insurance Act 1939 deals with insurance of ships and cargoes and with compulsory insurance by sellers of certain goods; but compulsory insurance is not necessary where the value of all the goods for the time being owned by a person in the course of business does not exceed £1,000. The insurance is undertaken, organized, and financed by the Board of Trade.

The Import, Export, and Customs (Defence) Act 1939 controls the inward and outward trade and the shipment of goods as ships' stores. If goods are shipped in defiance of the Act, they may be forfeited as prohibited goods, and severe penalties may be imposed.

The Liability for War Damage (Miscellaneous Provisions) Act 1939 is not limited to the present emergency. It is designed to relieve certain classes of persons from liability under contract, statute, or common law in respect of loss or damage by war. It affects bailors and bailees; buyers of goods on sale or return; innkeepers; pawnbrokers and pawnbrokers; and persons liable for custom and excise duties (including warehousemen).

The Prices of Goods Act 1939 was passed to prevent the price of goods specified by the Board of Trade being raised above a basic price for those goods by more than an amount referable to increases in certain specified expenses. Basic price means the price of such goods offered for sale on Aug. 21, 1939. Many orders and regulations have now been made for setting up control committees.

Constitutional. *The Ministry of Supply Act 1939* confers very wide powers on the minister of supply with regard to articles required for public services. He may grant loans for augmenting stocks or improving facilities for the storage of articles required for the public service. He may regulate and control the business of anyone dealing with such articles, and he is given extensive powers to insist upon production of information and returns. He may insist on priority being given over all other work and he may insist upon any person accepting a contract required for the public service on reasonable terms.

The Courts (Emergency Powers) Act 1939 was designed to prevent the enforcement of any judgment or order (with certain exceptions) by way of execution or bankruptcy or, in the case of a company, by execution or winding-up by the court unless leave of the appropriate court is first obtained. Judgments or orders, subject to exceptions, consist of judgments and orders for the payment of money whether judgment given before or after the commencement of the Act. Exceptions are judgments for the recovery of damages in tort, judgments on orders relating to contracts made after Sept. 2, 1939, judgments or orders relating solely to the recovery of costs, bastardy orders, orders enforceable as affiliation orders, and orders made in criminal proceedings or for the recovery of a penalty under a statute. The Act also prevents a landlord from enforcing judgment for possession in default of payment of rent or a mortgagee from recovering possession by reason of a default in the payment of money, except by leave of the appropriate court.

The Administration of Justice (Emergency Provisions) Act 1939 provides for the removal of the supreme court and other courts. It reduces the number of jurors from twelve to seven in criminal cases and does away with the right to a jury in civil cases. The Act also gives unrestricted power to magistrates to remand with or without bail for twenty-one clear days.

The Currency (Defence) Act 1939 allows the Treasury for certain purposes to cause the funds in the Exchange Equalization Account to be invested in the securities, assets, or the currency of any country, or to be used to purchase gold or silver.

The Emergency Powers (Defence) Act 1939 is of great importance in so far as the King in Council has the power, both directly or by delegation, to override any other Act of Parliament. The Act empowers His Majesty by Order in Council to make defence regulations and such regulations may amend, suspend, or apply any Act. The Act also provides for the hearing of proceedings of every kind in camera whenever the court thinks fit. It also extends the operation of legislation and regulations outside the United Kingdom. This Act is for a period of one year, but it may be renewed for a further period of one year on an address presented to His Majesty by each House of Parliament.

Civilians. *The Finance (No. 2) Act 1939* increased income-tax, surtax, estate duty, and custom and excise duties. The standard rate of income-tax was increased from 5s. 6d. to 7s. 6d. in the £ as respects the last three-quarters of the year. For 1939-40 the increase is averaged

over the whole year so as to result in a standard rate of 7s. in the £. In addition to increasing the rate of income-tax the Act also modifies personal allowances for the year 1940-41. Surtax is increased varying from one shilling and threepence for every £ of the first £500 in excess over £2,000 to nine shillings and sixpence for every £ in excess of income over £10,000 per annum. Estate duty rates are increased by one-tenth where the estate exceeds £10,000, but does not exceed £50,000. For all estates exceeding £50,000 the rate is increased by one-fifth. The Act also increased the duties on beer, spirits, wines, tobacco, sugar, molasses, glucose, and saccharin. The Act also makes provision for granting relief to persons whose incomes have been reduced owing to circumstances attributable either directly or indirectly to the war.

The Landlord and Tenant (War Damage) Act 1939 only operates when war damage occurs. It is designed to relieve tenants of the obligation to repair the damage, and under certain circumstances to relieve the tenant from payment of rent for the damaged property. If premises are rendered unfit by war damage, the Act provides for notices and counter-notices to be served. If a contract contains a provision imposing a liability to make good war damage it is treated as void.

The Possession of Mortgaged Land (Emergency Provisions) Act 1939 was passed to restrict the rights of mortgagees to obtain possession of mortgaged land and to amend the Courts (Emergency Powers) Act 1939.

The Personal Injuries (Emergency Provisions) Act 1939 operates during the present emergency, and provides for the payment of pensions or weekly injury allowances in respect of war injuries received by civilians.

The Rent and Mortgage Interest Restrictions Act 1939 will continue in force until six months after the duration of the present emergency. This Act applies the principal Acts of 1920 to 1933 to approximately ninety per cent of all dwelling houses, as the previous Acts had only imposed control on houses completed before April 2, 1919, and most of these houses had been decontrolled by the operation of successive Acts. Many had become decontrolled by the landlord gaining possession, but by section 2 of the 1939 Act this mode of decontrol is abolished.

The National Registration Act 1939 was passed to enable authorities to establish a national register of all persons resident in the United Kingdom at midnight on Sept. 29, 1939. Identity cards were issued to every registered person for purposes of identification in the event of death or injury arising out of an air attack. Any constable or authorized person is empowered to require production of the card on request.

The Forces. The conditions of service in the armed forces, the reserve and auxiliary forces are regulated by the following Acts which cover nearly every phase of service: *The Reserve and Auxiliary Forces Act 1939* which provides for calling up the reserves and for their reinstatement in civil life at the end of their service. *The Armed Forces (Conditions of Service) Act 1939* which *inter alia* provides for compulsory service overseas for the territorial army and the auxiliary air force. *The National Service (Armed Forces) Act 1939*, which took the place of the Military Training Act 1939, whereby in certain cases men up to the age of 41 are liable to be called up by royal proclamation, and which among many other things provides for conscientious objectors to military service.

Public Authorities and Local Government. The important part to be played by public authorities is set out in the

Civil Defence Act 1939, the Air Raid Precautions Act 1937 and the regulations made thereunder. The local authorities are made responsible for providing public air raid shelters and enforcing air raid precautions in all its branches. The schemes drawn up by the responsible officers of the local authorities have been put into operation, and vast sums of money have been and are still being spent on the provision and maintenance of an effective system of protection against enemy air raids. Fire brigades and the auxiliary air services, ambulances, stretcher-bearers, demolition squads, decontamination squads, first-aid posts—their establishment and maintenance are all carefully regulated, but the local authority is the responsible authority to which the government looks for the efficient and smooth working of the vast machinery of the Air Raid Precautions created by the Acts. Further powers are also given to local authorities under the *Housing (Emergency Provisions) Act 1939*, to enable them to repair any war damage to property, while under the *Essential Buildings and Plant (Repair of War) Damage Act 1939* provision is made for the repair of buildings, such as hospitals and schools, which are essential to the welfare of the civil population, and for the reinstatement of the plant of essential undertakings which have been damaged by war. The Housing (Emergency Provisions) Act 1939 generally enables the authorities to meet any emergency which may arise by extending the powers given to local authorities by the Housing Act 1936.

The above outline of the emergency legislation cannot, of course, do more than sketch the main features of the various Acts. It would have been tedious to repeat the words "*inter alia*," but these words must be frequently read into the article. It is, however, obvious that the emergency legislation has profoundly affected nearly every one in the realm and has, in effect, almost revolutionized national life. See also AIR RAID PRECAUTIONS; FOOD SUPPLIES IN WAR. (J. KE.)

EVACUATION. The precautionary evacuation of persons from regions exposed to hostile action is no novelty in war, but has become more important because of the new extension and intensity given to offence by aircraft. No part indeed of any belligerent country in Europe can be secure from attack, but certain areas can be distinguished as relatively secure and therefore a policy of transference and dispersal has been adopted by the countries at war and in danger of war. The term evacuation has been applied in the present connexion to this transference and dispersal of the civilian population.

Evacuation has been both compulsory and voluntary. In Great Britain, except in the case of civil servants, the evacuation has been wholly voluntary. The British evacuation scheme formulated by the ministry of health at the beginning of 1939 was at first intended to cover schoolchildren only. The country was therefore divided into three groups:

1. A limited number of large crowded areas from which evacuation was to take place, *i.e.* all metropolitan boroughs and most of the leading industrial, shipping, and naval centres, as well as more populous towns and boroughs in Essex and Middlesex.

2. A number of areas which, though not themselves to be evacuated, were not to be used for reception areas and were described as neutral areas.

3. Areas not to be included in (1) and (2) to be reception areas.

In these reception areas the local authorities were requested to undertake a survey of the accommodation

TWO HUNDRED CHILDREN WENT INTO RESIDENCE IN NOVEMBER
AT THE NATIONAL CAMP IN THE HOME COUNTIES

available for billeting in private houses and report by the end of January. It was decided that the main billets must be found in buildings regularly lived in rather than in empty property or camps. Experience of the holiday camps temporarily used by refugee children proved that they were quite unsuitable in rough weather. However, as a supplement to the scheme, a Camps Act was passed providing for fifty permanent camps to be built through the agency of non-profit-making companies known as the National Camps Corporation Ltd., each having accommodation for about 350 persons. Six of these camps were ready for occupation in Jan. 1940.

Following upon the children's evacuation scheme it was decided to include mothers with children under school age, expectant mothers, old persons, cripples, etc., in the scheme. The policy was not to empty the big cities, but to remove that portion of the population which was not necessary to the industrial and functional life of the cities. The billeting allowance to householders was fixed at 10s. for the first child and 8s. 6d. for subsequent children. After the outbreak of war, this was raised to 10s. 6d. for boys of sixteen years and over. The allowance for adults providing their own food was 5s. After evacuation had taken place the weekly expenditure on the children's account was estimated at £450,000, or 9s. per head, and from Oct. 28 a standard charge of 6s. a week was fixed for the parents' contribution, although those who could afford to do so were expected to pay the full 9s., and those who could not pay 6s. to pay less, the local authorities assessing and recovering payments.

With regard to the hospitals, it was decided that in case of war they would take both service and civilian casualties. There are in normal times about 500,000 hospital beds (including 150,000 in mental hospitals) in the country. It was reckoned that 112,000 could be freed at once by sending home patients and another 115,000 added; therefore, 250,000 beds could be made available for casualties within a short time of emergency conditions arising, and of these 200,000 would be ready within 24 hours. These arrangements were successfully accomplished in the days immediately preceding the outbreak of war. The medical schools attached to the hospitals were closed and the students were drafted to various provincial clinical centres.

In the case of the evacuation of business houses from the central part of London, the government advised the firms

concerned to move to neutral areas, but could offer no assistance. Firms, however, were naturally anxious to keep as near London as possible, and although some sought accommodation in the western half of the country, a good many endeavoured to establish their headquarters within fifty miles of London. With regard to civil servants, the government decided to transfer from London a limited number of departmental staffs who could perform their duties away from the centre without loss of efficiency. A billeting allowance of 21s. a week was granted. Actually, of the 80,000 civil servants working in London, only 16,000 were transferred during the first three months of war. A further 5,000 left in Jan. 1940. In order to house the staffs thus evacuated, the government, previous to the outbreak of war, provisionally commandeered a great many hotels and school buildings in various parts of the country. Practically the whole of London University was evacuated in September and its students scattered over various parts of the United Kingdom in co-operation with other universities.

Evacuation under the government scheme began on Friday, Sept. 1, and by the evening of the first day over half a million children and teachers had been moved from the congested and industrial areas in England and Scotland. By the following week, over 1,500,000 adults and children had been transferred to the reception areas. Owing, however, to the absence of air-raids and the dissatisfaction of the town-bred mothers with the phenomena of country life, a considerable number soon returned with their children to the cities. A further attempt was then made to evacuate children between two and five years by billeting them without their mothers, mainly in large houses, under the care of nurses and welfare workers.

It was estimated that 750,000 children were eventually billeted under the government scheme instead of the three million hoped for. As the return of those evacuated became the subject of much public and press comment, the minister of health asked the local authorities of the reception areas to take a census of those who had returned. The figures were not as high as expected. Out of the 1,500,000 moved, 50 per cent of the mothers and over 78 per cent of the children remained in the reception areas. There had been no outbreak of epidemics. Twelve thousand expectant mothers had been transferred and there had been 3,000 births in the first two months, with no increase in puerperal fever. A domiciliary medical service had been arranged for the children at the cost of £250,000 a year. However, the fact remained that a great many children never left the cities at all, and for this reason it was decided that the government's educational arrangements under the original scheme required modification. These had entailed the moving of each school as a unit with its teachers and the consequent closing of that school in the evacuation area. Schools in neutral areas had also been closed. Gradually this state of affairs was remedied and as many schools as possible were re-opened in the New Year. Many of the schools had been requisitioned for other purposes, and their release had to be effected and adequate air-raid protection built.

A return of business houses also took place towards the end of the year. About one-sixth of the firms which left London returned, but the larger concerns remained away. As a direct consequence, there was a considerable slowing down of all business operations.

France. In France voluntary evacuation from Paris followed much the same lines as from London. The

government requested all those who could, and were not needed, to take refuge in the country, and officially sponsored the removal of the schoolchildren. According to the returns made by the mayors and communes, over 2,500,000 persons left Paris and the suburbs at the beginning of the war. But the same causes that operated in England—absence of air-raids and dislike of country life—soon brought back a large proportion of this number. It was estimated that not more than a third of the population remained away. Contrary to the generally accepted view, a great many of the industrialized workers in Paris have no roots in the country. As in London, it became necessary to re-open the schools for the children who had remained or returned—about 10,000 out of a normal school population of 50,000. Two hundred and ten municipal schools were re-opened on Nov. 6, the distribution of the children being strictly governed by the air-raid shelter available.

In the eastern frontier region, evacuation was not primarily due to fear of air-raids. Here, on the first day of mobilization, the military authorities, according to a pre-arranged plan, ordered the complete evacuation of the civilian population of the towns and villages on the Rhine to a depth of five kilometres; Strasbourg, with a normal population of 200,000, being completely emptied. Later, the evacuation of the whole army zone, comprising the departments of Haut-Rhin, Bas-Rhin, and Moselle, was ordered. But, owing to the continued quiet on the Rhine front, the military authorities deferred the plans for the removal of the civilian population of Mulhouse and Colmar. Many of the inhabitants who had evacuated voluntarily at the outbreak of war returned later, and the schools, as in Paris, were re-opened on Nov. 6.

The transference of 650,000 inhabitants from the three departments of Alsace Lorraine was accomplished within the first week of the war. They were mainly accommodated in the towns and villages of the centre and south-west. The town of Perigueux received 150,000, five times its normal population. The policy of the government was to maintain the same regime in the reception areas as in the evacuation areas. M. Chautemps, vice-president of the council, was charged with the affairs of Alsace and Lorraine, and a consultative committee was appointed to consider all questions relative to the welfare of the transferred population. Twenty-one medical centres were established as well as work bureaux for men not in the army. The refugees were at first housed in wooden shelters, but later barracks were built. Efforts to ameliorate their lot were made by many charitable organizations, including a committee of American and British women resident in Paris, who sent a delegation to study conditions on the spot. The university of Strasbourg was re-opened at Clermont-Ferrand, except for the educational departments, which were established at Perigueux.

Germany. Information with regard to evacuation in Germany is necessarily slight, but there is no evidence that evacuation took place on account of the possibility of air-raids. The civilian population of Keitum, Manmarsch, and Westerland on the island of Sylt was transferred to S.W. Schleswig on Sept. 10, and the Rhine army zone would appear to have been cleared of the civilian population as on the French side. It was learned from a Roman source that the entire population of 130,000 of Saarbruecken was evacuated in twenty-four hours. According to the *Frankfurter Zeitung*, Saarbruecken-Stadt, Saarbruecken-land, Ottweiler, St. Ingbert, Homburg, Zweibruecken, Bergzabern, Pirmasens, and Gemersheim

were all forbidden to the civilian population without special permits. From a further source, it is understood that the civilian population was also evacuated from Karlsruhe, and from many places in Baden near the Rhine all those who were not sufficiently able-bodied to move at a moment's notice were evacuated to the east, some going to Wurtemberg and others to villages on Lake Constance. The official term for the evacuated parts of Western Germany is *Freimachungsgebiet West* = cleared western area. At Aachen, the remains of Charlemagne were removed, probably for the first time in history, and taken to the interior. Other treasures from the cathedral were also removed, but there was no general evacuation from the town. Many of the art treasures in Berlin were distributed in other parts of Germany. Both the French and German authorities introduced capital punishment as a penalty for looting.

Holland. In Holland preparations for evacuation from the main flood areas were made in November by the military authorities, but only a few villages were actually evacuated.

Finland. In Finland, before the outbreak of hostilities with Russia, only the voluntary evacuation of civilians from Helsinki and the other cities had taken place and many returned in November after the first tension was over. With the outbreak of war the population of Helsinki was reduced from 200,000 to 50,000. In Jan. 1940, although the enemy occupied only a relatively small part of the country, one-tenth of the population were refugees. All the schools were closed and education was at a complete standstill. It was estimated that 400,000 people had been evacuated and quartered largely in farmhouses and partly in public buildings.

Sweden. In Sweden plans for the evacuation of children between the ages of nine and fourteen from Stockholm, in case of emergency, had been prepared by the government by the end of 1939. (D. H.)

FOOD SUPPLIES IN WAR. In peace time Britain imports just two-thirds of her food requirements. This high degree of dependence on external sources of supply, higher than in any other country, naturally creates serious problems in time of war. How far do the normal sources of supply remain open? Can the shipping be found to transport the food? If not, how much more can be produced at home?

Great Britain entered the present war in a more favourable position as regards food than in 1914. She has rather more cattle, 50 per cent more pigs, and twice as many poultry. She has the same amount of wheat, and an entirely new crop, sugar beet, which furnishes a quarter of all her sugar requirements. One disadvantage from a war point of view is the loss since 1914 of over 2 million acres of arable land. Less fodder cereals and fodder roots are being grown, so that she depends more than formerly on imported feedingstuffs. Nevertheless, as regards imports the situation is relatively favourable. Whereas in 1914 considerable quantities of wheat and barley came from Russia and the Danubian countries, now almost all comes from North and South America and Australia, countries with which it is easier for Britain to keep open communications. Then the bulk of her sugar came from Germany and Austria; now almost all comes from non-European countries.

Furthermore, Britain undoubtedly entered the war in Sept. 1939 with substantial stocks of certain staple commodities. The policy of food storage had been in the forefront of public discussion for the previous two years and

Keystone]

EMPLOYEES OF THE TOTTENHAM BOROUGH CLEANSING DEPOT, WHO HAVE FORMED THE FIRST PIG CLUB OF THE WAR, INSPECTING THEIR PIGS

had received the support of several eminent economists. In the spring of 1939 the British government bought large quantities of wheat, sugar, and oils, though this may have been partly offset by private traders reducing their holdings. However, the trade statistics to the end of Aug. 1939 show notably larger imports of these commodities and of eggs than in the same period of 1937 and 1938.

The outbreak of war had an immediate effect on Britain's foreign trade. According to *The Times*, exports during the first two months of war fell by 42 per cent and imports by 27 per cent—food imports by as much as 32 per cent. The fall in imports was only to an insignificant extent due to ships being torpedoed or mined; it was principally because the available shipping was required for the transport of troops, munitions, and materials necessary to the conduct of the war. In the case of some foodstuffs, however, Britain was completely cut off from certain previous sources of supply. Some 15 per cent of her butter came from Sweden, Finland, and the Baltic States, now closed to her. The bulk of her eggs and bacon came from Denmark and the Netherlands, and though both countries continued to export after the war started, several cargoes were lost or captured, and deliveries to British ports were far less regular than usual. At the time of writing it seems unlikely that the menace of submarines or mines will cause grave anxiety; on the other hand, the experience of the last war makes it certain that the demands of troops and raw materials on shipping space will become increasingly great. For this reason alone, apart altogether from the difficulty of maintaining exports wherewith to pay for her requirements, it will be imperative for Great Britain to economize on imports of food and feedingstuffs, particularly of the bulkier commodities.

This leads us to a consideration of the measures taken to meet the problem of increasing production at home. Whereas in the previous war far-reaching efforts were not made to increase cropping until 1917, and these did not have their full effect till the crop of 1918, this time a plough-up policy had already been initiated before the war began. Early in 1939 the government announced a subsidy of £2 per acre for the ploughing up of fields which had been at least seven years under grass. When war broke out this plan was enlarged to a programme of ploughing up 1½ million acres, equivalent to 10 per cent of the grassland of England and Wales.

Each county was allotted a certain quota based largely on the acreage which had gone out of cultivation during the past thirty years, and the county war agricultural committees were instructed to divide this out among district committees which were to persuade their farmers to plough the requisite acreage. Judging from the progress made during the autumn it was confidently expected that the 1½ million acres would be ploughed up by the spring of 1940. Ploughing up has, of course, its critics, who urge that to tear up good pasture to produce indifferent corn crops is diminishing, not increasing, the productivity of the land. But since it has been shown that with normal yields arable land produces some four times as much food (reckoned in calories) per acre as grassland,¹ the crop must be a very poor one indeed before the advantages of ploughing are offset.

The ploughing-up subsidy was reinforced by an advance in the guaranteed price for the 1940 cereal crop. Wheat was advanced from 45s. to 49s. 6d. per quarter; the guaranteed price of barley remained at 10s. per cwt., but all growers could henceforth claim subsidy, whereas in 1938 only those not claiming under the Wheat Act might benefit. Oats were guaranteed at 27s. per quarter. This is in marked contrast to the 1917-18 position. The Corn Production Act of 1917 introduced guaranteed minimum prices, but they were always substantially below the prices prevailing in the market.

It will be seen that British farmers have been given substantial inducement to grow more crops. But this in itself is not enough. In the last war the food production campaign was severely curtailed by the difficulties in getting enough men, horses, and machines. The Food Production Department struggled constantly with the War Office for the liberation of men for farm work, and with the ministry of munitions to obtain tractors and steam tackle for ploughing. It is true that in this war Britain has conscription from the beginning and that agriculture is a reserved occupation. It is true that there are 60,000 tractors on British farms which can accomplish ploughing far more rapidly than steam tackle or horses. But the drain on man power has not yet made itself felt; there is no shortage yet of machinery, repair parts, and mechanics. If the war lasts for anything like as long, or imposes anything like a similar strain on Britain's resources as the war of 1914-18, then it may ultimately prove almost impossible, merely for lack of men and power, to increase, perhaps even to maintain, the arable acreage. Already for the 1939 harvest there was a mild labour shortage. The county councils released men from road work and from drainage schemes to help on the farms, several thousand soldiers were made available, and, in addition, there was in process of formation the Women's Land Army, which by November was 25,000 strong, with 2,000 already working on farms.

A further difficulty may be experienced in regard to fertilizers. Britain imported large quantities of rock phosphates, principally from North Africa; there may not be ships enough to bring it. Also much of the nitrate of soda normally used on the land is in war-time required for the manufacture of explosives. In the last war the fertility of the land suffered greatly, in part owing to shortage of fertilizer and in part to excessive cropping with wheat.

In regard to livestock, Britain is, as already mentioned, better off than last time. But the very fact of having

¹ Sir Thomas Middleton: *Food Production in War*. Oxford, Humphrey Milford, 1923.

more animals means that she needs to import more feeding-stuffs. In 1914-18, although the cattle population remained stable, the milk output fell 20 per cent, mainly because of the lack of imported feeds—cereals and oil-cake. The pig population fell 20 per cent, also mainly for lack of feed. This time the minister of agriculture announced that the dairy herd would have priority in respect of feedingstuffs, and for cows there would be no shortage. But pig and poultry keepers have been told to reckon with one-third less bought feed. To some extent this may be offset by using more garbage and kitchen refuse, but a certain decline in numbers will be inevitable. Indeed, pigs and poultry are the most costly kinds of livestock to keep in war-time. They live almost entirely on imported feeds; together they consume well over half the total feedingstuffs imports. To compensate for this reduction the government are urging an expansion of the sheep population, firstly because the sheep is an animal which reaches maturity comparatively quickly, and secondly because sheep feed almost solely on home-grown grass and, moreover, mostly on the poorer mountain grass. Attractive prices have been fixed as from Jan. 1940: 12d. per lb. for fat sheep and 13d. for fat lambs. A move has further been made to encourage pig clubs and pig-keeping in back gardens, since pigs reared in this way are mainly fed on waste and refuse. By the end of the last war pig clubs were producing meat at the rate of five million tons per annum.

Meat supplies from abroad are being maintained. After a drop in imports during the first two months of the war, it was announced in parliament in December that they were again up to the pre-war level. But the needs of the fighting services come first, and actually home butchers were being issued only 50 per cent of their normal supplies of imported meat.

In view of the urgent need to economize feedingstuffs, it has been questioned how far any home-produced milk should in war-time be utilized in butter-making. It is pointed out that 10 lb. of concentrates are needed to produce 3 gallons of milk which makes 1 lb. of butter. Therefore, it would economize shipping space to import the butter rather than the feed.

The prices of all concentrates have been fixed by the government at levels slightly above those of Aug. 1939 but considerably below the average of 1938. Preliminary control of fat stock sales was tried out in the autumn, followed by de-control in December, before a scheme of complete control was launched in Jan. 1940, the government then being the sole buyer of all meat. The prices proposed for January, at the time of writing, are for fat cattle from 37s. to 55s. 6d. per live cwt. according to quality, and for pigs 15s. per score (deadweight). Milk prices to producers were improved firstly by an increase of 2½d. per gallon in November in the price of manufacturing milk, and secondly by a government subsidy of 3d. per gallon so as to avoid raising the price of liquid milk. Meantime, agricultural wages had in most counties by the end of 1939 been advanced 2s. or 2s. 6d. per week.

Another line of activity for developing food production is the allotments campaign. The allotments movement which boomed in the last war had sunk back to a modest level of activity. So many times allotment land had been taken for building, road widening, etc., that allotment holders had lost heart. But in the autumn of 1939, under the slogan "Dig for Victory", local authorities were urged to set about providing half a million new 10-rod allotment

plots. As yet there has been no great demand, but the public attitude may change if food in the shops becomes much dearer or if any shortage occurs.

In the sphere of price-fixing and in the control of distribution the machinery of organization is already more highly developed than ever it was in the last war. Already by the end of 1939 the government had become the sole importer of all the principal feedingstuffs and the sole buyer from the British farmer of most of his products. This should make it far easier to control prices and to regulate the distribution of supplies. For several important commodities maximum retail prices were introduced in the early weeks of the war, notably for butter, sugar, and tea. Local food committees were set up by every local authority to supervise supplies and prices. Each has fifteen members, including five representatives of the retail trades, the others, two of whom must be women, representing all classes of persons in the area. Nevertheless, it proved impossible to prevent a pronounced rise in the cost of living in the early period of the war. From 155 on Sept. 1 the index rose to 169 on Nov. 1, and is still rising.

In order to make possible the issue of ration cards a national registration was carried out on Sept. 29. Ration books were issued to all householders in November, but actually only "unofficial rationing" was practised before Christmas, and that only in respect of butter and sugar. At that time, according to an announcement in parliament, only 50 per cent of normal butter supplies were being issued, but considerable quantities were being put into store. From January onwards, however, official rationing came into force: butter, 4 oz. per head per week; bacon and ham 4 oz., increased to 8 oz. at the beginning of February; sugar 12 oz.

It is too early to make any forecast as to how the position regarding food supplies will develop. No one knows how long the war will last, what strain will be put upon Britain's shipping and foreign exchange reserve, and what the calls on her man power will be. There will certainly not be enough ships or money to obtain from abroad all the food, and more particularly all the feedingstuffs, which Britain normally imports. As for making this good by increased production at home, much is being done. An addition of 1½ million acres to the arable land means over one million tons more grain (or its equivalent in other crops), or one-tenth of her feedingstuffs imports. But to ploughing up a limit is set, partly by the acres available of sufficiently suitable land and partly by the number of men which can be spared for farming. A certain reduction on peacetime supplies there will inevitably be, but the government has an organization in being which should obviate the occurrence of food queues, so typical of the last war, and should ensure a more equitable distribution of supplies than on the former occasion. (P. L. Y.)

HOSPITALS. The outbreak of war inevitably affected seriously the usage and administration of British hospitals. It was necessary to make ample provision for all possible naval, military, and air casualties requiring institutional attention, and it was considered desirable, also, to provide accommodation for a very large number of possible casualties among civilians following upon air-raids. Very many beds were kept empty for these purposes, and medical and surgical staffs were mobilized on a whole-time basis, or on a part-time basis with liability at a moment's notice to be called up for whole-time service. In most cases, hospitals were arranged in groups so as to make their joint accommodation more fully and systematically

available for different classes of patients. Actually, at all events during the first three months of war, some of these precautions proved to be over elaborate. They resulted, in some institutions, in provision for ordinary civilian cases being unduly restricted, in a considerable amount of expensive provision lying idle for a long period and, for a while, in many members of the medical and surgical staffs being barred from attending their private practices and having no other patients for whom they were responsible. The effect of these circumstances and arrangements on the finances of the voluntary hospitals and their staffs is not yet ascertainable but must be serious; and, apart from finance, the emergency organization itself, though accepted as temporary, is not unlikely, in some directions, to affect the position and the staffing of voluntary hospitals in the post-war period and even permanently. The danger to the principles of voluntary management and of part-time or honorary staffing is not negligible.

RADIUM IS STORED 280 FEET BELOW THE SURFACE IN ANCIENT CAVERNS; EXPERTS DESCEND TO COLLECT RADON GAS

An important development due to the war has been the provision of what may be described as rail-transport hospitals, (a) for military casualties, and (b) for civilian casualties. For the former a number of trains have been thoroughly equipped as travelling hospitals. Each consists of nine coaches, four of which have been converted into wards, one of these for officers. There are 36 beds to each coach arranged in tiers of three. At the end of each coach there is a lavatory and cupboard accommodation and in the middle of each a drinking-water tank. The first coach of each train is reserved for the two medical officers and two nursing sisters; the second is for the twenty N.C.O.'s and men who act as orderlies and kitchen staff; the third coach is for kitchen and stores; and the fourth is a dispensary. Two small padded compartments on each

train are fitted for acute mental cases, should they be necessary. For civilian casualty evacuation there are 34 trains, each a quarter of a mile in length, consisting of nine converted fruit or milk vans. The stretchers are fixed to each wall in three tiers, each van taking thirty cases. Dressings, drugs, disinfectants, and medical comforts are provided and the crew of each train consists of one medical officer, one train officer, three sisters, and eight other nurses, and eight St. John Ambulance orderlies. The transformation of the train from its ordinary purpose into a thoroughly efficient casualty hospital is remarkable. It should be noted that the British Red Cross Society and the Order of St. John of Jerusalem have amalgamated for the duration of the war as they did in 1914.

The compulsory grouping of hospitals for emergency and war purposes is likely to accelerate progress towards that regionalization of hospitals regarded as vital by the voluntary hospitals commission. This movement has been disappointingly slow, though there is increasing co-operation in some directions and there have been a few actual amalgamations, as in Birmingham and Newcastle. The conversion of Poor Law hospitals into public hospitals and the improvement in equipment and staffing have continued. The provision of "pay-beds" in voluntary hospitals has also expanded. There are now more than 2,200 such beds in the 146 hospitals of the King Edward's Hospital Fund area. They show an average profit of some £34 a bed. An important event has been the publication of the third edition of Captain J. Stone's book *Hospital Administration and Management*. It is the most comprehensive and authoritative work on matters both of hospital policy and of technical details of construction and management; and is now thoroughly up to date.

An interim report has been issued by the inter-departmental committee on nursing. There has been much concern as to the supply of nurses and as to their conditions of work. It is estimated that 12,000 recruits are needed each year. The present deficiency is due not to any diminution in the number of entrants but to a rapidly increasing demand and to the fact that a large proportion—from 20 to 30 per cent—of those entering the profession do not continue beyond their first year of training. Important recommendations as to recruiting, training, status, and conditions of work are made, and some of these have already been put into effect in some hospitals.

In New Zealand the government named June 1 as the date for the coming into effect of the hospital provisions of the Social Security Act. In connexion with the hospitals of Brisbane it is noteworthy that the university of Queensland has now established a complete faculty of medicine and a full-time medical school. (H. BR.)

INDUSTRY, WAR CONTROL OF. This article deals with the organization and effects of governmental control of industry as exercised in time of war. So short a time has elapsed since the outbreak of war in Sept. 1939, that it has not been found possible to say much about the actual effects; problems rather than effects have been dealt with.

Organization. Already before the war the British government had taken measures of a preparatory nature, such as the accumulation of stocks of certain essential materials; the creation of "shadow" factories whose output could be greatly expanded if need arose; the formation of the ministry of supply, which came into legal existence on July 13, 1939; and the passing of the Emergency Powers (Defence) Act of Aug. 24, 1939.

With the outbreak of the war the ministry of supply put into full operation the powers it had been given for the organization of the output of munitions of all kinds for the army (the navy and the air force maintaining their separate supply organizations), and also took over control of the supply and allocation of raw materials for all the services. In this latter respect the procedure adopted was to constitute separate control boards for each of the important raw materials, the main function of the boards being to regulate prices and the distribution of supplies with priority for government and essential civil requirements. The chief directing personnel in the controls has been drawn from the trades in question, thus giving effect to the principle that, so far as possible, industry should control itself. The other side of the work of the ministry of supply—the stimulation of the output of munitions—made rapid progress during the first four months of the war. On Dec. 19, 1939, the minister announced that contracts to the value of £234,000,000 had been placed, while an elaborate system of cost accountancy and inspection of books had been instituted to ensure that the state was not paying excessive prices. The country has been divided into thirteen areas administered by regional commissioners, who are responsible for mobilizing all the local industrial resources available. By the latter part of Dec. 1939 the number of firms under contract to the ministry had in fact risen from 12,810, before the war, to 15,000.

In addition to the ministry of supply—the Board of Trade, the ministries of food, shipping, transport and economic warfare, the departments of mines and of overseas trade and the Treasury—all these have vast and important functions to carry out in wartime, many of which impinge directly or indirectly upon the conduct and well-being of industry. The last mentioned of these departments, the Treasury, is in a key position, through its control over expenditure involving the sale of foreign currencies, *i.e.* the finance of imports. But it also comes directly into contact with industry by virtue of its newly acquired power to license all new capital issues. An illustration of the changing conditions produced by war can be taken from the iron and steel industry: the import duties on foreign iron and steel were abolished on Dec. 5, 1939, and fourteen days later a licensing system was introduced for the import of iron and steel, as well as many of the raw materials required by the industry. Again, in agriculture, the marketing boards have been transformed from producer-controlled quasi-monopolies into government agencies for carrying out wartime control and distribution of supplies.

At the same time that domestic industries were being subjected to a network of controls, steps were taken to resuscitate and expand the inter-allied economic co-operation, which played so important a rôle in the last year of the Great War. On Nov. 17, 1939, it was decided to form six Anglo-French committees to take executive action in the whole range of buying whatever may be needed by the two countries, both for military and civilian purposes. The six committees deal with the following matters: aviation, munitions and raw materials, oil, food, shipping and economic warfare; and in all matters of supply the two countries have agreed to draw up their import programmes jointly. The degree of co-operation extends, however, much beyond a mere arrangement to avoid competitive buying; thus it involves the pooling of shipping facilities, and, by a later agreement in Dec. 1939, the pooling of the foreign assets of Britain and France. The Franco-British exchange has also been pegged for the duration of the war,

Fox Photos]

ASSEMBLING WORLD'S FASTEST BOMBERS IN A FACTORY IN THE NORTH OF ENGLAND

for government purposes, at 176½ francs to the pound. It would be difficult to over-estimate the importance of these measures for the successful conduct of the war on its financial and economic side.

Effects. The main tasks of economic organization in wartime are firstly, to maximize the total output of the labour, capital and natural resources of the country and, secondly, to divert as much as possible of this output to essential war purposes. The latter task presents great difficulties, as it involves establishing an order of priority between the main competitors for output—the war services, exports, and the minimum needs of the civilian population. All of these are important, while, in the case of man power itself, there are the further claims of the fighting forces. It is impossible to carry out these tasks without a large measure of control over the economic system.

In the Great War economic controls were slow to establish themselves, and it was not until after the Germans had adopted unlimited submarine warfare in the spring of 1917, that the organization of the economic life of the country was undertaken on a comprehensive scale. By the end of the war, however, it had attained a high degree of development. In the present war, the aim has been to start off from approximately the stage of development attained at the end of the last war. At the same time, the air menace has led to the emergence of new problems which have given rise to the establishment of a great deal of administrative machinery, not all of which turned out to be immediately needed, while some of it involved financial waste and a serious interference with the other major tasks of wartime economy.

The immediate effects of the outbreak of the present war were to disorganize very seriously the exporting industries of the country and also a great deal of normal domestic trade, owing partly to the direct effects of a state of war, partly to evacuation (which hit London particularly hard) and partly to the new controls themselves. Many of the difficulties and embarrassments in the economic field during the first four months of the war, arose from two main factors. Firstly, the system of controls which had been worked out in 1918 was the outcome of the accumulated experience of four years of war, and those who were administering the controls had lived with and in the organization as it was developing. On the other hand, the present generation of civil servants had to cope, for the most part without previous experience, with a system of controls which had not been evolved organically, but had

sprung into life already fully mature—at least on paper. It will undoubtedly take time, and the making and correction of many mistakes, before the present organization can function really efficiently. Secondly, the appearance of administrative and economic chaos in the opening stages of the war was necessarily enhanced by the fact that enough time had not elapsed to allow the new purchasing power being created by the vast government expenditure to offset the decline in individual income occasioned by the initial impact of the war upon economic life. As soon as the combined effects of government expenditure and of the withdrawal of labour into military service have resulted in the full employment of the man-power and industrial resources of the country, it will be faced with scarcity on every hand and both the scope for, and the need of, organization will become very much greater.

It has been shown in the first section of this article that the wartime control of economic affairs is divided between a large number of separate ministries and government departments and, at the moment of writing, there is an evident lack of co-ordination between them. There is no central authority capable of imposing a common economic policy upon ministries, each of which is sovereign within its own sphere. At the same time, measures adopted by one ministry may have damaging effects upon the interests of others.

The war organization of economic effort is still in its very early stages, and, as yet, there is no indication that a solution has been found for three major problems, all of which are closely inter-connected—the problems of prices, wages, and the finance of the money cost of running the war.

(C. W. G.)

NATIONAL SERVICE. Of the many notable developments in the sphere of national service in the year 1939 the most significant was undoubtedly the passage into law during May of the Military Training Act. Although before this reached the statute book all military service in Great Britain in time of peace had, in modern times, been based on the voluntary principle, conscription had been imposed in the later stages of the Great War of 1914–18. The compulsory principle was also implicit in the militia which had been replaced by Haldane's Territorial Force, and the duty of the citizen to assist in the defence of the realm is an undoubted principle of the English common law. It is probable that to most Englishmen the passage into law of a measure compelling every young man of twenty years of age to undergo six months' military training marked not so much an important constitutional innovation, which it was, as the first step in the transition from a state of peace to a state of war.

Prior to this, the various branches of national service had expanded rapidly in the opening months of the year. A national service handbook was issued to all householders in January giving information as to the directions in which different persons' services could best be utilized according to their age, sex, and qualifications. Recruiting both for the fighting services and for civil defence went on steadily until the month of March, when the German government destroyed the Czech State in violation of its previous pledges to respect her independence. Shortly after this the British government gave guarantees to Poland, Rumania, and Greece, and to enable these to be implemented by military action it was decided to double the Territorial Army's field force so that the latter was now to comprise fourteen divisions. Scarcely had this decision been reached when the Military Training Bill was introduced. It was opposed

somewhat half-heartedly by the Labour party but, while some objections were raised to the compulsory principle, there was too large a measure of unanimity on behalf of the cause which the measure was intended to further for the opposition to it ever to reach serious proportions. The public was in a mood to demand strong measures and to accept sacrifices in order to carry them out.

At the same time as Britain's defences were being expanded both by legislative enactment and by voluntary effort, the government showed its determination to avoid the repetition, if a state of emergency should arise, of one of the most serious mistakes of 1914. A list of reserved occupations was prepared, designed to ensure that men engaged in industrial or other work, which by reason of its nature was vital to the maintenance of the national effort in the event of war, should not leave their posts: men in such occupations of over a specified age, which varied in each case, could not be enrolled in the armed forces or given a full-time post in any civil defence organization. This list has since been altered from time to time.

On the eve of the outbreak of war between Great Britain and Germany, the National Service (Armed Forces) Bill was passed into law. This made all male British subjects between the ages of 18 and 41, except ministers of recognized religious creeds, liable to military service: the minister of labour had, as before, the right to classify as reserved any occupation which he thought proper, and men in such occupations could, at first, be neither conscripted nor, if volunteers, accepted. At the beginning of 1940, however, the minister ruled that men in certain reserved occupations should be accepted as volunteers. By the end of 1939, the age-groups between 20 and 23 had been ordered to register, and at the beginning of 1940 authority was given to call up the age-groups between 19 and 28 without the formality of a royal proclamation. Meanwhile numerous volunteers, both for the fighting services and for civil defence, have enrolled themselves and been accepted for service since the beginning of the war.

(W. T. WE.)

WAR AND PEACE AIMS. What is the distinction, when a nation is engaged in war, between its war aims and its peace aims? Broadly speaking, one may say that the war aims of a nation consist in the end which it sets before itself, or, in other words, in the limit to which it proposes to go, in reducing the military forces of the enemy nation. But since it takes two to play at the game of war, and since either side will have its separate idea of the end or limit to be attained in the conduct of hostilities, it is obvious that the war aims of one side will be affected by those of the other, and that an extension on the one side will tend to be followed by an extension on the other. In this sense the end or limit cannot be said to be fixed: it moves with the movement of the dynamic process of interaction which is set in motion by war. The peace aims of a nation may also similarly move during the process of war. They always relate to three main things, and they always consist in the end or limit proposed for dealing with these three things: first, the method of the negotiation of peace (that is to say, whether the treaty of peace should be unilaterally imposed, or bilaterally agreed, or multilaterally determined); secondly, the settlement of the detailed terms of peace, especially in regard to frontiers; and lastly, the fixing of the general scheme or system of relations which is to be maintained after peace has been negotiated and its detailed terms have been settled. But while peace aims always relate to these three main things,

and are in that sense constant, they will also vary and move with the actual course of hostilities. The war may extend or alter its scope; and that will extend or alter the general scope of the peace which follows the war. We can only speak of war and peace aims, as they stand at the beginning of 1940, in terms of the general conjuncture of events, and the general state of feeling at that precise moment of time. On the other hand if the nation is convinced that the ideas of war and peace with which it has begun the war are valuable in themselves, and ought to be steadfastly followed to the utmost possible extent through all conjunctures and contingencies, there may be a steady certainty of purpose even among the uncertainties of war.

War Aims. The war aim of Great Britain and France is not only, or simply, the defeat of the military, naval, and air forces of Germany by such methods of warfare (and among them the economic method) as we have at our command. It is also, as the prime minister stated in his broadcast speech of Nov. 26, the defeat of a mentality—a mentality which sees in reasons of state a justification for the use of force to dominate other peoples, for the practice of persecution on inoffensive citizens, and for the repudiation of pledges and pacts whenever they are found inconvenient. A war aim which includes the defeat of a mentality may seem, at first sight, to be a vastly extended war aim. It may seem to involve a fight against the spirit and the genius of a people. The opposite is really the case. We restrict and define our war aims when we include among them the defeat of a mentality. We restrict and define them for the simple reason that this mentality is not, in our view, the mentality of a whole people. It is the mentality of a section which has seized the command of a whole people, and controls and employs against us a whole people's military resources. So long as that section has the control, we must employ against those resources the whole of our resources. But our ultimate war aim consists in breaking the power of that section, and not in breaking the people, or the spirit and genius of the people, which is commanded, for the time being, by that section. If we are told, and if it is proved, that there is not and cannot be any division—that the section is the people, and the people is the section—we shall have to alter our war aims. But as they stand to-day, they are in no way directed to the breaking of the people. They are directed to the breaking of the military resources of a people because those resources are commanded, and so long as they are commanded, by a section which is permeated by a particular and intolerable mentality; and they are so directed because the real thing which we wish to break is that mentality. In the speech which has already been mentioned the prime minister, after declaring that it was the British war aim to defeat a mentality or a spirit, added some explanatory words which deserve to be quoted in full: "If the German people can be convinced that that spirit is as bad for themselves as for the rest of the world, they will abandon it. If we can secure that they do abandon it without bloodshed, so much the better; but abandoned it must be."

It follows that our war aim does not involve the breaking of Germany—unless Germany has to be broken in order to break a mentality. A war aim which can conceivably be satisfied "without bloodshed" is not a war aim which implies that result. If an authority arose in Germany which disavowed the mentality and the methods of the last seven years, our war aim might be achieved without any further prosecution of war. Whether there is any

chance of the rise of such an authority is an issue which depends on the balance of forces and wills in Germany. But in any case there is one thing to be said about the character of this war which has a vital bearing on our immediate war aims, and which may vitally affect our ultimate peace aims. It is not clear (indeed it is far from clear) that we are engaged in what may be called a "national" war—that is to say, a war in which the nation of Germany is confronted by the nations of France and Britain. On the contrary, it may be held that we are engaged in something which is of the nature of a "civil" war—that is to say, a war in which one set of ideas about the proper system and constitution of Central and Western Europe is pitted against another set of ideas. In that sense we are engaged in a war of ideologies. If we are so engaged, we have to defeat the ideology opposed to our own. But there is this difference between the ideology which we defend and the ideology which we challenge. France and Britain are united to a man in support of the ideology which they defend. It is still obscure whether there is any such union on the other side. If there is, the war will become a "national" war, and the war aim will become that of a national war. If there is not, there will remain, at any rate on one of the two sides, the element of "civil" war, and the war aim will remain affected by that fact. That is why, at the beginning of 1940, there is still some obscurity about war aims. It is also perhaps the reason why the war, in its initial phase, seems to us to have followed a curious and even paradoxical course.

There are other riddles besides the riddle of the character of the war. There is the riddle of the possible extension of the war. An extension of the war might also extend, or at any rate modify, the nature of our war aims. Russia stands as a question mark, both in regard to the foreign policy which she intends, or may be led, to pursue, and in regard to her own internal stability. There may be further movements beyond the movement which has plunged her among the snows and ice of Finland. There may also be internal cracks which will have external reverberations. Italy meanwhile stands in a prepared state of non-belligerency. There has seldom been a new year of which it was less possible to foresee the end. 'All that can safely be said is that war is a fire which is apt to spread. But perhaps, to-day, a contrary thing can also safely be said. The aversion of the masses in all countries from war is greater than it has ever been. A new factor in Europe, which may be of vast importance for its future—a factor which vividly appeared, like a flash of lightning, at the end of Sept. 1938—is the popular passion for peace and the popular feeling for the peace-maker. The tendency of the fire of war to spread may be met and turned back by a new tendency of general feeling among the masses. That would affect, and very vitally affect, the war aims of statesmen and governments. And it would affect them in all countries alike.

Peace Aims. In turning from war aims to peace aims we enter the more congenial field of construction. It is, however, a misty field. The temper in which we shall find ourselves at the end of the war will largely determine our construction. But we do not know what it will be: we only know the temper in which we find ourselves now. Similarly the materials with which we have to build will largely determine what we build. But we only know the materials which lie to our hands at present: we do not know what they will be in the peace year.

(a) So far as the method of negotiating peace is concerned

—and that question of method and procedure is the first question which arises—our present temper, based on the experience of the last twenty years, is a temper averse from any idea of an imposed or dictated peace, even in the event of an absolute victory. An imposed peace might be just and right in its actual provisions: we feel that it would be none the less wrong—and fundamentally wrong—in the method of its making. France and Britain, in their own internal systems, stand for the method of free discussion, which is the essential method of democracy. They will naturally and logically carry that method into the negotiation of peace; but they will also naturally and logically claim, if they are the victorious side, and if they are thus “in a majority”, that the other side should do its homage to the majority-principle, and should recognize that, if there is to be give and take, it will have to do a good deal of the giving. But the general principle of the allied cause will involve something more than the inclusion of Germany as a partner in the negotiation of peace. It will involve the inclusion of other states which are not now belligerent, and may never be belligerent during the course of the war. “What touches all should be approved by all.” All who are touched and concerned by the terms of peace should be drawn into the negotiation of peace. Non-belligerent powers—including (it is conceivable) powers which have no “temporal” power—may aid and strengthen counsel. No aid which would help to secure a genuine and lasting agreement can be refused.

(b) Perhaps the detailed terms of peace are a matter of less fundamental importance than the method (which also involves the spirit) of the negotiation of peace. But there are matters which belong to the sphere of detailed terms that are cardinal—so cardinal that, whatever the method and the spirit of negotiation, they must be secured in any treaty of settlement. Foremost among them is the matter of the restoration of national liberty wherever it has been destroyed or diminished to a shadow. “We desire”, as the foreign secretary stated in a speech of Dec. 5, 1939, “that peoples that have been deprived of their independence should recover their liberties.” In the same sense Pius XII, speaking on Christmas Eve, laid down as the first postulate for a just and honourable peace that all nations, great and small, strong and weak, have a right to life and independence, and that when this equality of rights has been destroyed or damaged or imperilled, the juridical order calls for reparation based on justice.

The general principle is clear. It involves the restoration of the liberties of the Polish and Czech peoples: it involves the free determination by Austria of her own future. But the details of the application of the general principle must be left to negotiation, and the give and take of negotiation; and they must involve that element of compromise and that attempt to find a *via media* which is inherent in negotiation. The Poland to be restored is not necessarily Poland as it stood on Aug. 31, 1939. The old boundaries will have to be redrawn—here, it may be extended, and there, again, retrenched. Whether a plebiscite should be taken and, if so, in what areas and under what auspices, will be a matter to be settled in the negotiations which precede the treaty. The essential thing is that the Polish people should recover its liberties: the thing which is open to negotiation is the demarcation of the frontiers of the Polish State, whether that demarcation is wholly settled in the treaty itself or is partly left to be settled subsequently by the method of plebiscite. The same may be said of the restoration of the liberties of the Czech people. They

are themselves a fixed quantity, which stands beyond negotiation and compromise. But whether there should be again a state which is called Czecho-Slovak, or whether the new state should be Czech and what, in either event, should be its boundaries, are questions which can be assigned to the area of discussion.

The future of Austria raises questions somewhat different from those raised by the future of the Polish and Czech peoples. It is not clear that Austria is the home of a separate people in the same sort of sense as Poland and Bohemia are the homes of separate peoples. What is clear is that the inhabitants of Austria should be given the right of declaring, freely and independently, what it is that they want to be—what sort of state they wish to form, or into what sort of state they desire to enter and upon what conditions. It cannot be justly said that their case has hitherto been treated on its own merits. It has been treated almost exclusively not in itself, but in relation to the general balance and system of Europe. No state can be considered without some regard to that system; but it has been the misfortune of Austria that she has been considered, from one side and the other, with an almost total regard to factors outside herself. In the making of a new treaty that error should be corrected, and Austria should have the liberty of declaring for herself, what it is that she herself desires.

These are some of the main matters which belong to the sphere of the detailed terms of peace. They are not likely to be the only matters; but, at the present time, they are what we regard as the crucial matters. For ourselves, and for our ally, there is no question of territorial aggrandizement. For Germany, so far as we are concerned, there is no question of territorial diminution, except such as is involved in the recovery of their liberties by peoples which have been temporarily brought under the domination of Germany. Whether the colonial question, and especially the question of African colonies, is likely to be raised in the negotiation of peace is an issue which depends on the arbitrament of the future. It has not hitherto been directly raised. No statement of peace aims has hitherto included any specific objects in this field. The general question *may* be raised at the council table round which the terms of peace are negotiated. If it is raised, its solution will depend on other and larger issues. It will depend on whether a new Germany has arisen, and whether that new Germany is included in some new system of Europe.

(c) Here we come to the third main problem involved in any attempt to state peace aims. Over and above the problem of the method of negotiating peace, and over and above the problem of the detailed terms of peace, there is the problem of the fixing of the general scheme or system of relations which is to be maintained after peace has been negotiated and its detailed terms have been settled. The three problems are of course interwoven. The method of negotiating peace, and the detailed terms of peace, will affect, as they will also be affected by, the general scheme or system of relations which statesmen propose to fix. It is only in an analysis that the problems can be separated.

Federalism. The general movement of thought, in regard to a new scheme or system of relations between the states of Europe, has lately been moving in a direction which may be called federal. M. Daladier, in a speech delivered before the French Senate on Dec. 29, 1939, referred to a possible federal organization in the future between European states. British statesmen have not yet made so specific a reference. But the British prime

minister, in his broadcast speech of Nov. 26, went a considerable distance in the same direction. He did not speak of a federal European organization. But he defined the main British peace aim as being the establishment of "a new Europe." In that new Europe, he said, thinking immediately of the terms of the peace to be made at the end of the war, "such adjustments of boundaries as would be necessary would be thrashed out between neighbours sitting on equal terms around a table with the help of disinterested third parties if it were so desired." In that new Europe, he added, looking farther into the future, there must for the sake of lasting peace be a full and constant flow of trade between the nations concerned; in it, each nation must choose its own form of internal government: in it, armaments would be gradually dropped, except in so far as they were needed for internal order. He went still farther. He argued that the establishment of such a new Europe would be a continuous process stretching over many years, and would need some organs capable of conducting its development. He did not specify the machinery which would be necessary, nor did he use the word federal; but he concluded by expressing his hope that a new Germany, animated by a new spirit, might take part in the operations of such machinery.

The door stands open for a policy of the gradual introduction of some federal organization in Europe—the policy sketched by Briand before the Assembly of the League of Nations in Sept. 1929. The door was not closed, though a just caution was expressed, in the speech which the foreign secretary, Lord Halifax, made in the House of Lords on Dec. 5. Any federal organization, however tentative, will obviously require some measure of resignation of national sovereignty—some writing of a minus against the plenitude of such sovereignty. Lord Halifax spoke of the idea that nations should surrender in some measure their national rights in order to clear the way for a more organic unit. He said that he did not know that he would go quite so far. He urged the view that no paper plans would endure which did not freely spring from the will of peoples. He argued that it was the economic side of international collaboration which needed emphasis and thought; but he also admitted that, from working together on concrete problems in finance and trade, closer political understanding might spring and develop.

Here there arises an issue which arose, in much the same form, when Briand sketched his policy ten years ago. Should the union of Europe proceed on economic lines, and take the form of a European Customs Union, as the followers of Stresemann were inclined to believe? Or should economic considerations be subordinated to politics, as Briand believed, and should some form of political union first be attempted? Perhaps the divergence is not as great as it may *prima facie* appear. Any union of Europe which may follow the war, and be attempted (at any rate in some tentative form) during the negotiation of peace, will have been preceded, and indeed is already being actually preceded, by measures of union—measures of a federal character—which have been adopted in connexion with the prosecution of war. War measures may bear peace fruits. In the war measures already adopted in the interests of union, there has been no divergence of opinion about the priority of economic or political measures. Indeed there has been no question of priority: both sets of measures have been adopted simultaneously. We may notice three sets of measures which have been adopted. The first has been the establishment, by France and Great

Britain, of a common foreign policy. The second has been the establishment of a Supreme War Council, representing both countries, to direct the military forces of both. The third has been the establishment of an Anglo-French co-ordinating committee to gather together the financial and economic resources of both countries. These measures, touching as they do the three matters which lie at the root of any federal system, constitute the germs of a nascent federation. They are measures which are at once political and economic. If they are confined, for the time being, to France and Great Britain, that is the result of the immediate exigencies of war. They have the potentialities of something more. They can develop into a magnet around which other countries may cluster.

In any case the federal idea is entering, in one form or another, into the peace aims of France and Britain: indeed it has even entered (perhaps by imitation) into statements of German peace aims. But the idea of federalism is not the only general idea which bears on the fixing of the scheme or system of relations in the new Europe which has to be constituted at the end of the war. Perhaps, indeed, it has the merit of being able to include, or carry, other ideas which, it is generally felt, must also enter into the fixing of that scheme—ideas such as disarmament, or again the reduction of economic barriers and a movement towards the freedom of European trade. But some of these other ideas have such importance that they must also be considered in themselves.

Other Considerations. Disarmament comes first among these ideas. The gradual dropping of armaments, except in so far as they are needed for internal order, has been declared by Mr. Chamberlain to be a cardinal article of a new European system. It was equally emphasized, as the second of his postulates for peace, by Pius XII in his address of Christmas Eve. The words which he used have been echoed by general opinion on the French and British side. He spoke of the danger that material forces may become not the defender, but the tyrannical violator, of right: he urged that peace must be founded upon disarmament, mutually accepted, organic and progressive, both in the practical and the spiritual order of things.

A second idea concerns the provision of machinery both for the just interpretation and for the equitable revision of treaties, and especially of the treaty which must be concluded at the end of the present war. A fixed treaty system, as we have learned from the experience of the last twenty years, does not remain fixed. It only leads, if there is no adequate machinery for revision as well as for interpretation, to unilateral infringements. Here is matter for the reform of the League of Nations (which a federal organization between states in Europe would make no less necessary, but perhaps even more necessary)—for the strengthening of the Permanent Court of International Justice, and for the institution of a new "equity" court which would be competent to consider requests for the revision of treaty arrangements. Here, too, enters the third of Pius XII's postulates for peace—"the constitution of juridical institutions which may seem to ensure the loyal and faithful application of agreements, and, when the need is recognized, to revise and correct them."

A third idea concerns the proper protection of minorities, ethnical or religious, and particularly of the great international minority of the Jews. That protection is a general problem; but obviously it is a problem nowhere more urgent than it is in regard to the Jews. Minorities are bound to appear before the council table round which the

Fox Photos]

A NATIONAL SAVINGS SHOP HAS BEEN OPENED AT MARGATE; THE MAYOR IS SEEN SELLING SAVINGS CERTIFICATES

new treaty will be made: in particular, we may expect the Jews of Europe (and not only of Europe) to put their case. Our peace aims are bound to include some new attempt in the settlement of the problem of minorities. Covered by the dust of war ourselves, we cannot yet clearly see all that is emerging. But we can accept, even if we have not yet stated, the fourth of the Pope's postulates for peace—that "attention must be paid to the true needs and just demands of the nations and peoples, and of the ethnical minorities", and that these demands must receive our friendly examination, so that they may be met in a peaceful manner.

This is where, so far as it is possible to see, we stand at the beginning of 1940. But the year has its movements to come and its new lessons to teach. (E. BA.)

WAR FINANCE. Governments in war have to spend large amounts of money which must be raised by taxation and loans if inflation is to be avoided. By inflation is meant an increase in the general level of prices arising out of an increase in expenditures while goods available for purchase are not correspondingly increased in amount. The problems of war finance are centred round (1) those of expenditure, mainly the avoidance of waste, (2) the reduction of consumption so that saving is maximized, (3) problems of taxation, and (4) the raising of loans. As the war proceeds the economy of the belligerents turns from an uncontrolled to a controlled economy, vast expenditures take place on capital goods such as armaments, machinery, and shipping, and to a less extent on consumption goods such as food, clothing and petrol. A nation at war has to limit its consumption per head in order that goods required for the navy, army and air force may be available without difficulty and, in order that

savings may be at a maximum, the government taking these savings either as taxation or as loans for the prosecution of the war. In Germany, for example, the production of capital goods since 1934 has increased by 100 per cent while the output of consumption goods has increased only fifteen per cent. All reserves of labour and plant have been utilized in re-arming the State, and the savings of the people have been used for financing the huge expenditure on re-armament which Hitler in 1939 put at Rm. 90 milliards or about £6,000 millions since he came into power.

Great Britain. War was declared on Sept. 3, and the first war budget was presented to the House of Commons on Sept. 27, 1939. Faced with the necessity of planning for a three years' war which must involve great and increasing expenditure, Sir John Simon, chancellor of the exchequer, had recourse to heavy increases both in direct and indirect taxation. The direct taxpayer will pay £76,500,000 more in 1939-40, and £160,000,000 in 1940-41, mainly through an increase in the standard rate of income-tax. Indirect taxation will bring in £30,650,000 more in 1939-40, and £66,500,000 in 1940-41 on all alcoholic drinks, tobacco and sugar. This will be supplemented by an excess profits tax at the rate of sixty per cent on excess profits which is based on the principle of the armaments profits duty, but not restricted to armament firms. The excess profits tax cannot at present be estimated, and a tax on the increase of individual fortunes during the period of the war cannot be estimated until after the war. (See BUDGET; EMERGENCY LEGISLATION; INCOME-TAX for details.)

The total expenditure is estimated at £1,933 millions, and this will be met to the extent of £995 millions from revenue, and £938 millions from loans. The estimate of £995 millions is based on the April estimates plus additional taxation, less a reduction of about £54 millions in yield in the original estimates. The detailed figures of expenditure and revenue are given in the article BUDGET.

The changes in income-tax and sur-tax for a married man with three children, with an earned income at the 1940-41 rate work out as follows: on an income of £800, at the rate of 2s. 5½d. in the £; on an income of £1,500 at the rate of 4s. 3d.; and on £2,000, at 5s. 0½d. A standard rate converted into a graduated scale by a series of allowances at one end and by sur-tax at the other does not fit in very logically with the capacity to pay, and it is not unlikely that a new method of assessment may be introduced in the near future. The rates of estate duty are also increased.

The chancellor of the exchequer has not repeated the mistake of taxing too little and borrowing too much at the outset of the war. He is, in a year which includes six months of war, raising by taxation nearly £400 millions more than was raised during 1917-18. The figures of 1939 are in striking contrast with those of 1914. There was national debt then of £650 millions while to-day it is not far short of £8,000 millions. In 1914, pre-war expenditure, apart from defence expenditure, was about £150 millions while to-day it is about £690 millions.

The appointment of a national committee on expenditure, referred to below, will be in the direction of preventing waste. Apart from this there are now anti-waste officers in the ministry of supply and in the air ministry. The treasury has sent an economy circular to all departments, and it is intended by the war cabinet to prune services not essential to the winning of the war. The budget, too, is the proper instrument for bringing about the curtailment of consumption. It is sometimes forgotten how expensive the waging of war is. Already in Nov. 1939, it was costing

Great Britain £6,000,000 a day as compared with £1,500,000 a day in 1914-15, £4,274,000 in 1915-16, £6,022,000 in 1916-17 and £7,389,000 in 1917-18. As the present war continues, the cost will mount up considerably. A modern aeroplane costs from three to seven times as much as a comparable type in 1918; a division of troops in the field costs nearly twice as much to equip and maintain in the field as it did in the last war; the cost of a battleship is now two or three times as great as it was when the navy was last engaged. In the last war the British parliament sanctioned between Aug. 6, 1914, and Nov. 25, 1918, votes of credit to the extent of £8,742 millions, and the war cost Great Britain over £10,000 millions, while if allowances were made for the expenditure of the Dominions, the total would be well over this amount.

The gross national income in the year 1918 can be put at £5,500 millions. The expenditure in that calendar year was £2,700 millions of which all but £200 millions can be regarded as the cost of the war. In short, about fifty per cent of the national income of the community was devoted to war purposes. At the end of 1939 the national income is at the rate of nearly £5,800 millions or £6,000 millions. In view of the present rapid price changes and the great upheaval in employment and profits, there is only a rate of national income at the present time in, say, a particular month. When there is no such thing as unemployment, which should vanish in the autumn of 1941, and when Great Britain reaches her maximum productive war effort, the gross national income, without any change in the value of money, should be something of the order of £7,000 millions. If we apply the same proportion as in 1918 the resulting total expenditure should be about £3,500 millions. Owing to the very great changes in productive capacity per worker, the proportion of the national income which could be afforded for war now would be much greater and without depressing the standard of consumption below that of 1918 it might be sixty per cent of the national income, £350 millions a month, or £4,200 millions a year. Until total national expenditure has reached some figure such as this, Great Britain will not be making her maximum national effort.

The time is approaching when existing British taxes will have passed their maximum yield, and it will be necessary to look round for new sources of revenue. In the first place, Great Britain has not tried new kinds of taxation which have been successful in other countries, notably the sales-tax. Secondly the taxation of incomes on or below £150-£200 per annum is still light. There is no direct taxation of wages for example in the lower ranges of income as in Germany. As taxation stands to-day, there is a risk of undermining that great professional and services class which is rightly described as the backbone of this country.

About two-thirds of the national consumption of Great Britain is by people below the income-tax level, and if more money finds its way into the purses of the wage earners in wartime, there is need to withdraw some of it from the market of consumable goods.

The prospect of the government's borrowing policy cannot yet be estimated with accuracy, as it has not yet (Jan. 1940) been made public. The chancellor of the exchequer has stated that he will borrow as cheaply as possible and it is unlikely that he will pay the high rates which were paid in the last war. He has already wisely decided to tap the small saver before announcing his larger loans, and in this at the end of 1939 had met with remarkable success. A

new issue of savings certificates with a currency of ten years, combined with defence bonds carrying a three per cent rate of interest to be issued at par and repayable seven years from the date of purchase at a premium of £1 per cent were admirably adapted to appeal to the two classes of investors, the wage-earners and the lower ranges of income-tax payers whose abstinence from consumption is so essential at the present time. The yield on savings certificates is £3 3s. 5d. per annum free of income-tax for the whole period of ten years, as compared with £2 18s. 4d. on the present series, an increase of 10d. The yield on defence bonds is £3 2s. 7d. per annum including the premium of £1 on redemption at the end of seven years. The £500 limit on individual holdings of certificates has been retained; no individual will be allowed to hold more than £1,000 of the new bonds. The terms offered to the small saver are generous. It requires only organization up and down the countryside, throughout towns and villages, in shops and industries, by means of a roaring, tearing propaganda to make these loans a great success.

It will be seen that British public finance since the outbreak of war rightly commands the confidence reposed in it both in Great Britain and abroad. The budget, as it has not been in Germany since 1934, has been presented year in and year out. The balance between taxation and loans has been followed and borrowing has been kept within bounds. The chancellor of the exchequer has not hesitated to increase taxation wherever necessary. Moreover the importance of public expenditure has not been overlooked. In December, a select committee on national expenditure, of 28 members of the House of Commons, was appointed. The function of the select committee is to see that the nation is obtaining full value for its vast war expenditure and that there is no waste. The terms of reference exclude expenditure on social services from the scope of the enquiry. There was a similar select committee appointed during the last war, but not till 1917. That select committee delegated much of its work to sub-committees which sat in the spending departments and it is understood that it saved many millions of pounds.

Australia. In presenting the budget to the Commonwealth parliament on Sept. 8, 1939, the Rt. Hon. R. G. Menzies, prime minister and treasurer of Australia, estimated revenue for the year 1939-40, based on 1938-39 rates of taxation, at £96,030,000, and expenditure at £101,916,000. To meet the deficit of £5,886,000 income-tax was increased by ten per cent on the incomes of individuals derived from personal exertion or property. The company-tax was raised to 1s. 7.8d. in the £, and tax rebate in respect of dividends received by absentee holding companies was abolished. These three proposals were estimated to produce increased direct taxation of £2,360,000. The rate of the sales-tax, leaving the exemptions as they stand, was increased from five per cent to six per cent and the method of calculating the sale value in respect of imported goods was altered. The total additional revenue thus from the sales-tax is estimated at £1,142,000. By certain increases in customs and excise duties £2,130,000 was to be raised. By these new proposals a sum of £5,910,000 was budgeted for. The prime minister said that of the defence expenditure something over £12,000,000 was to be taken from the budget, £2,000,000 from balances in the trust fund, and about £19,000,000 from loans.

A supplementary financial statement was presented in the House of Representatives on Nov. 30, 1939, by the acting treasurer the Hon. P. C. Spender, who declared that

the financial policy of the government was to finance the war effort by a balanced programme of taxation, borrowing from the public and borrowing from the banking system. The balance between these three methods would change from time to time according to economic circumstances, and for the time being the government had decided that the balance would be weighted towards borrowing with the assistance of the banking system, rather than towards taxation. The government was of opinion that to increase taxation again would delay recovery and would interfere with the full prosecution of the war programme. The government would before the close of the financial year transfer the emphasis of its financial policy from borrowing from the banking system as economic recovery got under way, firstly to borrowing from the public and, secondly, to taxation. Part of the borrowing plan would be an issue of savings certificates. Early in 1940 the government would bring forward a comprehensive scheme of war taxation. If this were done, and other controls on exchange prices and capital investments maintained, Australia would avoid the evils of excessive credit expansion.

The outstanding feature of this supplementary budget was the greatly increased estimate for defence and war services. The revised estimate was increased from £33,137,000 to £62,014,000 of which £46,181,000 was provided from the loan fund and included capital war expenditure of £15,583,000 and pre-war capital defence work £20,383,000. The total estimated expenditure from revenue was £101,452,000. The estimated total receipts for the year were £101,490,000. Under the budget and supplementary measures, new taxation amounting to £8,150,000 is to be levied during the present financial year. This includes the raising of the rate of company-tax to 2s. in the £ as a result of the supplementary budget.

Canada. In the first three months of the war, orders to the value of \$25,000,000 were placed for military requirements in Canada, \$9,000,000 in Britain, and \$10,000,000 worth of aeroplanes from the United States had been purchased. This was in addition to the \$25,000,000 of railway equipment required under the emergency conditions. The minister of finance, the Hon. A. L. Ralston, estimated at the end of November that the programme for the first year of war would cost the Dominion \$315,000,000. Canada's contribution in the first phase of the war has been mainly economic—the provision for a steady flow of munitions, aeroplanes, food and supplies.

For the year ended March 31, 1939, the revenue was \$502,000,000 and the expenditure \$557,000,000. In introducing the war budget on Sept. 12, 1939, the acting finance minister, the Hon. J. L. Ilsley, estimated the expenditure at \$651,000,000 as compared with a total expenditure estimated last April of \$550,000,000, and deducting the total revenue of \$495,000,000 he arrived at an anticipated deficit of \$156,000,000. In order to meet this increased expenditure, the Canadian House of Commons passed legislation increasing import duties on wines, spirits, tea and coffee. It also passed an act to amend the Special War Revenue Act by which excise taxes were similarly increased. In addition to this the Canadian House of Commons also passed an Excess Profits Act and legislation increasing the income-tax both of individuals and of corporations. The excess profits tax was to prevent profits rising to high levels. The schedule of rates ranged from 10 per cent on profits in excess of 5 per cent but not exceeding 10 per cent of the capital employed, to 60 per cent on profits exceeding 25 per cent of the capital. The amended

income war tax provided for a war sur-tax of 20 per cent on individual incomes other than corporations. The corporation income-tax was raised from 15 to 18 per cent on the net income of corporations regardless of whether they came under the excess profits tax or not. In the case of corporations issuing consolidated accounts, the income-tax was raised to 20 per cent. It is interesting to note there was no increase in the sales-tax, but the base of this tax was broadened by removing from the schedule of exemptions electricity and gas used for domestic purposes, salt and smoked meats, and canned fish. An act was also passed creating a department of munitions and supply. None of the self-governing Dominions has shown greater determination and greater courage in regard to its war finance than has the Dominion of Canada, and the greatest emphasis has been laid on the production of munitions in destroying the menace of Hitlerism. Sir Wilfrid Laurier used to say that the nineteenth century was America's, but the twentieth would be Canada's. If the present war is a long one, it may well transform Canada into the industrial and financial citadel of the Empire.

New Zealand. The New Zealand budget for the year 1939-40 presented by the Rt. Hon. M. J. Savage, acting minister of finance, on Aug. 1, 1939, budgeted for a revenue of £38,260,000, and an expenditure of £38,243,000. On Sept. 26 the Hon. W. Nash, minister of finance, brought forward a supplementary budget to raise £9,750,000 which will be required to finance war activities for the remainder of the financial year. A substantial portion of this sum is to be obtained by the following taxation increases: 3½ per cent on death duties, 3d. per gallon on beer, 15 per cent on wines and spirits, 25 per cent on tobacco, and a gold tax of 75 per cent of the difference between the prices on Aug. 24 and the date of sale, and also a surcharge of 1d. on all letters. The total of £9,750,000 will be applied to expenditure in New Zealand only. The finance minister estimated that about £20,000,000 would be needed for the first year of the war, and probably equal sums later. In addition, all New Zealand produce available for export is to be sold to the British government. This shows the great war effort of the Dominion, with only a million and a half people, and an average annual governmental expenditure on revenue account of only £27½ millions.

Union of South Africa. In the budget put forward in March 1939 by Mr. Havenga, the then minister of finance, for the year ending March 31, 1940, revenue was estimated at £44,110,000 and expenditure at £44,860,000. Mr. Havenga referred to the cost of South Africa's "huge programme of armaments". South Africa is not merely guarding, in co-operation with the British naval station at Simonstown, one of the Empire's most important sea routes, but is pledged to assist any of her British neighbours in South-East Africa—the Rhodesias, Kenya, and Tanganyika—which may be threatened. The amount earmarked on the estimates for defence expenditure from revenue funds during the year is £2,237,620, and, in addition, the intention is to spend certain sums from loan funds in accordance with the £6,000,000 development scheme outlined in 1938. In addition to this the government has decided to contribute £300,000 from revenue funds. The minister also announced that £1,500,000 would be appropriated from loan funds for defence purposes, and that the bulk of the 1938-39 surplus of £1,650,000 would also be devoted to defence purposes.

Mr. J. H. Hofmeyr, the new minister of finance, pointed out on Oct. 25, 1939, that the effect of the war on the

economic system was to provide a stimulus for increases in prices, profits, interest rates, and so forth. National interests, however, required that the greatest possible economic stability should be maintained. The Union was very favourably placed because of its strong financial position. The Reserve Bank held £112 in gold for every £100 which it owed to the public, including many deposits with it by other banks. He announced that in addition to the programme of capital expenditure begun before the war there would be the growing commitments for defence. This was, he said, not a time to borrow money in London, nor to cut down capital expenditure nor yet to substantially increase taxation. The fixing of the price of gold at a figure below the price in the open market allowed the government a sufficient margin of profit, and was the soundest policy for meeting expenditure.

The Union of South Africa produces one-third of the world's gold production, and during the calendar year 1939, the Transvaal output was 12,819,344 fine oz. against the previous record of 12,156,629 fine oz. in 1938. The value of so important a supply of gold adds greatly to the war potential of the British Commonwealth of Nations.

France. War finance in France goes back in reality to the steps taken by France's able finance minister, M. Reynaud. The economic and financial decrees were published in the *Journal Officiel* of April 22, 1939. They fell naturally into three groups—rearmament, finance and labour, and it is with the first and second of these that we are now concerned.

The increased rearmament expenditure during the current year (1939) under these decrees was about Fr. 15 milliards (£83 million) over and above the amount allocated in the budgets for that year. The war ministry estimate was increased by £25 million, the navy estimate by £27 million, and the air estimate by £30 million.

The financial decree dealt with income-tax evasion, profits of the national defence industries, the turnover tax, death duties on farm properties, public works expenditure and with the investing of capital. The scope of the financial decrees is briefly as follows: Taxable income is assessed on the visible expenditure of taxpayers where necessary in order to cope with evasion. There is no right of appeal. National defence industries have their profits limited to 30 per cent. A special tax rising progressively from 50 per cent to 100 per cent is to be paid on all profits exceeding 6 per cent. A special armaments-tax of 1 per cent on all payments, excluding payments for the purchase of bread, milk and newspapers, is to be paid by all dealers, factors, middlemen and shopkeepers, including importers and co-operative societies. To compensate for this the tax on business and professional premises is reduced by 20 per cent. Farms not exceeding Fr. 100,000 (£600) are exempted from death duties, and for those not exceeding Fr. 200,000 (£1,200) death duties are reduced by half. Public works expenditure, including road maintenance, is reduced by about 1,500 million francs (£8,500,000) during the current year. The state and the various boards dependent on it are forbidden to invest public moneys in any private enterprises. Existing shareholdings in trade and industry, with certain exceptions, are to be sold and the proceeds used for the amortization of the national debt. The public services under the labour decrees were pruned, the men dismissed being offered alternative employment or compensation. The length of the working week was raised to 45 hours, at the rate of 5 per cent above normal rates of pay.

On Nov. 17, a special war-tax of 15 per cent was levied,

retrospective from Nov. 1, on the incomes of all men, with certain exceptions, of military age (20–49) not serving with the forces, police, merchant marine or in certain zones of the fishing fleet. The first 7,000 francs of the annual income is exempt and the sum exempted rises by 1,000 francs for each child up to and including the fifth. A general war-tax on all incomes of 5 per cent was levied from Jan. 1, 1940, in place of the previous 2 per cent tax.

In the budget for 1940 passed on Dec. 28, M. Reynaud separated the civil from the military expenditure. The entire civil expenditure, amounting to 79.9 milliards francs (about £450,000,000), is collected together within the present budget. The revenue, slightly more than the expenditure, is obtained from taxation. All military expenditure is met exclusively from the proceeds of treasury bonds or loans to be issued later. There is a check on the expansion of civil expenditure since any increase would have to be met by further taxation. Allowances to families of mobilized men, estimated at over 14 milliards francs (£79,800,000) are included in the budget. The Chamber also voted extraordinary war credits amounting to 259 milliards francs (£1,476,000,000) for the current year. The total expenditure in 1940 will thus be of the order of 340 milliards francs (approximately £1,926,000,000).

France has huge reserves of which only a part is represented by her stocks of gold, and there is plenty of money on the market. M. Reynaud announced that 25 milliards have been repatriated since the beginning of the war, and that 10 milliards of gold or foreign currencies have been converted into francs. These sums, added to 26 milliards francs repatriated during the ten months preceding September give a total of 60 milliards of francs, excluding repatriated foreign stocks or debentures. The reasons of the return of gold in such large quantities are that with the exchange control applied last September, the exchange office and the treasury required information of all assets placed abroad by private persons and companies. The two declarations made it almost impossible to conceal holdings abroad, and these had, therefore, either to be brought back to France, or kept in the form of foreign exchange and made known to the revenue authorities. On Dec. 13, 1939, a comprehensive agreement between the British and French treasuries was announced. Both governments undertake: to avoid during the war any alteration in the rate of exchange; to enable each other to cover their requirements in the other's currency; to use that currency without having to find gold; not to raise any foreign loan or credit except in agreement or jointly with the other government; not to impose fresh restrictions on the imports from the other country during the war for protective purposes or for exchange risks. The two governments will share certain items of expenditure, such as financial assistance to Poland and other countries. In general the French contribution will be forty per cent and the United Kingdom contribution sixty per cent of the total. There will be also frequent meetings between the two treasuries to settle technical questions and to examine more general problems. The agreement remains in force until six months after the signature of the treaty of peace.

Germany. In the Third Reich no budget has been published since 1934, and it is therefore difficult to examine the German financial structure in detail. The outstanding fact since Hitler came into power in 1933 is the huge expenditure on rearmament, which Hitler himself just before the invasion of Poland estimated at 90 milliards of marks (£6,000 million). Since this has been achieved in the space

28 WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES

of six years, and more especially since 1937, it is important to examine from what sources the costs were met. It was not difficult during the first few years when taxes were low, and many millions unemployed, to turn over to a controlled economy. By 1937, full employment was already in existence, and there were signs of strain in the financial structure. Rising government expenditure year after year exceeded revenue by many millions of marks. During the first few years of the Nazi regime, when the government income was low and the capital market drained of funds, the government relied primarily on short term borrowing. Contractors were permitted to draw bills against the government or its agencies, and these bills were discounted by banks which in turn could present them for re-discount with the Reichsbank. The bills were like commercial bills, except that their maturity date could be extended from time to time. They tended to inflate the circulation, but the government considered such an inflation safe so long as it was accompanied by a corresponding increase in production and employment and prices were kept under control. In the spring of 1939 tax-anticipation certificates were introduced. This plan was in fact a forced loan by the state. Under it, the government, the municipalities, the defence department, the state railways and the post office, paid cash only for sixty per cent of their supplies, and the remaining forty per cent was paid in taxation credit certificates; contractors were authorized to adopt the same method in paying sub-contractors. The new finance plan never won the confidence of the public, and when the value of the certificates fell to 94 per cent of their face value, the scheme was dropped from Nov. 1. The chief aim of the plan was to prevent a dangerous increase in the note circulation and its failure may be regarded as a covert admission that the efforts to avoid the normal effects of inflation have failed. The banks were already holding delivery certificates, and, with the additional tax certificates their liquid position suffered further deterioration. Since the declaration of war, the fighting forces have been empowered to meet their expenditure by issuing special bills called *Wehrmachtsverpflichtungsscheine*, which are discounted by the banks. These bills are for not less than Rm. 10,000 and are mainly used for financing war industries. They are not re-discountable, nor can they be used as collateral for loans. They have been devised to avoid inflation, like their predecessors, but it is doubtful whether they will be any more successful because they will swell the non-liquid holdings of the banks, while the more liquid assets will be brought quickly to the Reichsbank for re-discounting. The amount of this secret borrowing cannot be estimated with any accuracy, but in the five years ended March 31, 1938, it must have been at least of the order of Rm. 15 milliards.

Side by side with this short-term borrowing, the Reich has been able to vote a large number of medium and long-term loans. From 1935 to 1938 inclusive, such loans amounted to 15.6 milliard marks. Public borrowing was greatly facilitated by the practical monopoly of the capital market by the government. Only a few private issues have been permitted. This public debt in Dec. 1939 had reached the level of Rm. 35,550,000,000 (approx. £3,000 m.). During August and September it increased by Rm. 2,720,000,000 (£266,000,000). Savings in unemployment relief due to full employment, in the five years ended March 31, 1938, amounted to Rm. 7.4 milliards.

To-day Germany is the heaviest taxed country in the world. The National Industrial Conference Board of New York has recently shown that taxation per head in Germany

was lowest in 1913 and highest in 1938, despite the comparatively slight increase in her public debt. The proportion of national income appropriated by the government by taxation was also highest in Germany. The collection of taxes has recently been made stricter, and the rates are much higher especially since war broke out. The income-tax on all incomes over Rm. 2,400 (approx. £150) a year, already severe, has been increased by 50 per cent, and special taxes of 20 per cent on the retail prices were imposed over and above the existing duties on luxuries including beer and tobacco. It is interesting to compare the taxation of the lower incomes in Germany with those in Great Britain. In Great Britain, on an income of £250, an unmarried man pays £11 13s. 0d.; a married man (without children) £2 6s. 0d. In Germany he would pay, respectively, £44 2s. 0d. plus 50 per cent and £24 10s. 0d. plus 50 per cent and if married over five years and still without children £34 6s. 0d. plus 50 per cent.

It is understood that new war-taxes and measures for special saving in war-time are to be applied early in 1940. The proceeds will help to defray the cost of the war, which is estimated at Rm. 50,000,000,000 a year as compared with Rm. 35,000,000 a year in the last war. War costs have risen all round, and are not confined to munitions. The German soldier in 1914 got 35 marks a month; to-day he gets 170 marks in which are included family allowances.

The large expenditure on armaments, which is approximately five times greater than that of the United Kingdom since 1934, has been paid for by keeping down consumption to the somewhat low level of 1932-33 and by sweeping away into the Reich's coffers by means of a rigid control of capital and industry the savings of the people. Prices and wages have been ruthlessly clamped down, and in October were forced back to the level of 1936, although subsequently there has been some modification so that the monetary burden which was being laid disproportionately on the working classes will to some extent be improved.

There are signs that the German financial machine is bearing an enormous strain; inflation in the note circulation of the Reichsbank which increased 44 per cent in the twelve months previous to the outbreak of war has not passed without comment, although Dr. Funk has stated that the aims in German war finance were, no inflation, no deflation, strict control of prices and wages and the taxing away of war profits. (See also WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES.)

Space precludes a discussion of the treatment of Germany's foreign creditors since the Nazis came into power in 1933. Foreigners have lost down to the beginning of Jan. 1937 Rm. 7.45 milliards. It has been calculated that only one-fifth of the contractually established claims for interest, and only one-tenth of the capital were repaid in the way stipulated. The repudiation, or what has amounted to repudiation, began on the standstill front which dealt with the short-term foreign credits. This was followed by a suspension of the full interest in the medium-term loans, and this in turn was followed by a moratorium. A good account of the breach of faith in Nazi Germany's foreign loans is given in Dr. Nurbert Nuhlen's book *Der Zauberer: Leben und Anleihen des Dr. Hjalmar Horace Greeley Schacht*, first published in 1938 in Switzerland and recently translated into English. (G. F. S.)

WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES. To-day a war is not fought only on land, sea, and air. With the advance of industrialization, the machine and chemical processes have been brought to the

soldier, just as they have been brought to the worker. To-day a war is totalitarian. It means the co-ordination of every section of the national life, of every brain and nerve in the country. Great wars are no longer decided on the battlefield. A country at war has to see that it obtains a plentiful supply of war materials as well as of food. It must reduce to a minimum, energetically and speedily, the amount of man-power and materials consumed for purposes other than war, and divert the surplus entirely to producing directly or indirectly the maximum of war effort. A belligerent must, at the same time, keep its industrial production intact so that it can not only produce munitions of war and supplies for the Services, but export goods to pay for imports. Otherwise it will have to use up its gold, exchange and foreign investments to pay for them.

In the following paragraphs it will be necessary to deal with the industrial power of the belligerent, its power to produce armaments, chemicals, etc. This alone is only one factor. It must have also a continuous supply of raw materials, especially iron, coal, petrol, rubber, copper, bauxite, lead, and manganese. There are some thirty-four raw materials which are required in war. Germany, for example, has four of these in sufficient quantities. There are seven she requires to supplement by imports and twenty-three for which she relies completely on imports. Some of these are so bulky that it is not possible in anticipation of hostilities to keep large stocks. It is possible to substitute some of the materials by others, thus copper can to some extent be replaced by aluminium which is manufactured from bauxite. Some materials are of vital strategic importance, manganese for making steel, and chromium for armour plates and projectiles, stainless steel, and high-speed cutting tools. There are other metals required for hardness and strength; tungsten, molybdenum, antimony and vanadium. Mercury too is necessary as a detonator in high explosives and ammunition. Rubber is now of great importance owing to the mechanization of armies.

If we are to judge from the last war, the total national consumption in wartime is not very different from the total peace consumption, although wartime consumption

is much greater in certain directions, *e.g.* petrol, rubber, and bauxite. In some articles there may be a saving as in Germany, which can almost dispense with heavy fuel-oil requirements for her 2,328 ships now being driven off the seas. The productive power of the country is simply shifted from ordinary civilian requirements to war essentials. The quantity of raw materials and food imported depends not only on the country's natural resources, but on its ability to draw, as can Great Britain, on foreign sources of supply, which in turn depends on means of transport, and of payment.

The Federal Reserve Bulletin of Dec. 1939 contains a careful estimate of the Federal Reserve Board of the assets of various belligerent and neutral countries, in forms which can be converted into dollars with reasonable certainty. The total for the Allies is a minimum figure, being the market value and covering only United States securities. There are, in addition, considerable British holdings of non-American securities which American investors would find attractive; Canadian industrials, gold mines and rubber companies. The table below gives the details:

The outstanding fact from these figures is the strong position of the Allies relatively to that of Germany. On the other hand, the value of the dollar is lower now than in 1914, and in 1914 the Allies could purchase on credit.

Great Britain. Great Britain is a rich creditor country; her navy and merchant marine are decisive factors as in the last war. So long as Great Britain has command of the seas, she has the world to draw on, especially the British Empire, for food supplies and raw materials. Unlike Germany, she is not forced to squander man-power in the production of *ersatz*, but can economize by importing finished goods. She is placing in the field 3,500,000 men, excluding the contingents which are arriving, or have arrived, from the Dominions, India, and other parts of the Empire. If statistics relating to man-power, merchant shipping, petrol, coal, iron ore, steel, copper, rubber, cotton, wool, wheat and other articles are compiled for the British Empire, France, Germany, Russia, the United States and other countries, it will be seen that neither the Allies nor Germany can depend on their own supplies,

30 WAR POTENTIAL OF LEADING EUROPEAN COUNTRIES

and that only in the production of steel is there substantial equality. The Allies have a much greater output of domestic iron ore and coal, and are able to obtain without much difficulty raw materials necessary for the prosecution of the war; their economic strength is overwhelming.

In industry Great Britain has considerable reserves, as the country has not been mobilized except during the last three years, and then only partially; a contrast to what has been taking place in Germany. During the last fifteen years, there has been a revolution in British industry. In the engineering industry, for example, the physical output per operative in the 1930-35 period has risen as compared with 1924 by not less than 52 per cent; in textiles by 37 per cent; in public utilities and government departments by 27 per cent, and in agriculture by the same amount. Since 1924, the productivity of employees in factories has risen by the surprising figure of 25 per cent. It is, of course, possible for output in an industry to increase although the amount of employment which it has given has fallen. If Great Britain hastens to employ its increasingly efficient labour power in raising the national output of goods and services, and to do away with unemployment for the duration of the war, it would have a greater war potential than any other country in the world, with the possible exception of the United States. The national income of Great Britain is somewhat greater than that of Germany, and the per capita income is very much greater. She is therefore able to turn to war production a much greater amount of the national income, goods, and services produced. At the beginning of the war, Great Britain had a gold reserve of the order of £500 millions and in addition a considerable amount of foreign exchange and foreign investments. At the end of 1938, according to Sir Robert Kindersley, British capital overseas in quoted securities and unquoted investments amount to £3,692 millions.

France. France's economic war potential is greater to-day than before the World War. As a result of the Treaty of Versailles, the rich industrial region of Alsace-Lorraine was restored to her, and in 1929 the output of iron and steel was double that of 1913. Her industrial production, which was slightly over 48 per cent of that of Germany in 1913, was over 66 per cent of that of Germany in 1929. France cannot manufacture munitions to the extent that Germany can, but can increase her output to a considerable extent, provided her industrial areas behind the Maginot Line are kept more or less intact. Secondly, while France is not completely self-sufficient in foodstuffs, the amount of agricultural land available per inhabitant is twice as great as that of Germany; in this respect she is much superior to Great Britain which has to import at least two-thirds of her supplies compared with one-fifth in the case of Germany. Apart from food, France is, with one exception, much on the same level as she was in 1913-14 as regards raw materials. Although she is deficient in coal, her own coal meeting only 60 per cent of her needs, she is now self-sufficient in iron ore, and has a large surplus for export. Oil seeds, nickel, chromium, graphite, and phosphates, she can obtain from her colonies. So long as Great Britain and she control the seas, she is able to draw on foreign supplies as required. She has a considerable mercantile fleet, and she holds about two and a half times as much gold to-day as at the end of 1913.

Germany. Germany since 1936, indeed, since the Nazis came into power in 1933, has produced armaments at a great rate, while consumption goods have not greatly in-

creased. Before the war, she was suffering from economic tension, and had been, as it were, in a state of siege since the second four-year plan of 1936. She has been able since the war to import food and raw materials from her eastern neighbours, and from the Baltic. In ordinary times she can satisfy 80 per cent of her requirements, including fodder, by home production. She is compelled to import the remaining 20 per cent; but this includes some vital imports, among them fats and feeding stuffs, which if not imported will in the long run mean deterioration in the supply of milk and cattle, and this will also detrimentally affect the home food consumption. She lacks too, important raw materials, notably oil, although with the introduction of the second four-year plan in 1936, she has made a great effort to produce it from coal. The importance of oil in modern warfare is well known. Only 36 per cent of Germany's total consumption can be produced from domestic raw materials, and she has to depend on Rumania, Russia, and Poland for further supplies, which, however, cannot meet her requirements, especially in war-time, when she will require at least ten million tons a year, as compared with 7,500,000 tons, her consumption in 1938. In the last war, when Lorraine and Silesia were still in Germany, Germany was 70 per cent sufficient in iron ore, but to-day only 25 per cent of her requirements are supplied by German mines, and it is doubtful if the Hermann Goering iron works can raise this above 30 per cent, although some economy might be achieved by the greater use of scrap. Her main source is Sweden. Germany is dependent upon imports for at least 50 per cent of the fats which are required for munitions as well as for food. Germany's gold holdings, foreign exchange, and investments abroad are dealt with above. The Reich is in a much less satisfactory position than in 1914. At the outbreak of the last war, Germany was next to Great Britain in the list of creditor countries, rivalling France for second place. She was exporting capital year after year abroad. To-day, Germany is a debtor country. As a result of the world war, she lost her foreign assets, and to-day her indebtedness to foreign countries is very much greater than her foreign assets. She has to depend on herself, and on her immediate neighbours for supplies of food and raw materials as she has not the command of the seas. She has allowed her industrial plant to depreciate in recent years at a rapid rate; the condition of her railways, and indeed of many of her factories, is far from satisfactory. By the middle of 1938, her rolling stock was actually 10 per cent less than at the beginning of 1929. Her strained finances are referred to in the article on war finance. On the other hand, she has great organizing ability, and entered the war with several years of preparation behind. *Wehrwirtschaft*, the science of organizing the country's life for war has been studied and practised since the last war, and in this respect Germany is far superior to both Great Britain and France.

Italy. Italy is relatively poor as compared with Great Britain, France, and Germany. Italy produces steel, but her output is less than one-fifth of Great Britain's. Her output of motor cars, is only 16 per cent of Great Britain's; she is said to be capable of turning out from 250 to 300 aeroplanes a month. Her home production of foodstuffs is about 95 per cent of her requirements if expressed in calories, but Italy is very deficient in raw materials. She can only supply 19 per cent of her requirements of minerals. She has practically no coal, iron ore, copper, petroleum, or other minerals. Her position in time of war would be exceedingly vulnerable in other directions owing to the

superior power of the British and French navies in the Mediterranean. Her gold holdings and investments abroad are also far from being able to bear the strain of a long war.

Russia. In recent years, Russia has paid considerable attention to industrial production, but she is still of little importance as a great exporter of raw materials. She requires production mainly for herself. In total value, her export trade does not compare with any of the British Dominions or India, and she ranks behind Denmark. She cannot export, especially iron ore and oil, without overcoming great transport difficulties. The only really satisfactory route for heavy traffic between Germany and Russia is the Baltic. The Baltic ports, however, are at the opposite corner of European Russia from the Russian iron ore and oil fields. It is at present impossible to take oil tankers by the Danube from the Black Sea to Germany, as this would mean much constructional work on the Danube, and complicated transshipment arrangements. The railways are unable to solve the transport problem. Immense distances are involved and gauges are different. Professor Hopper of Harvard university, who spent several years in Russia after the Great War, concludes¹ that Russian help for Germany can become important only if German engineers have had a minimum of two years to reorganize the Soviet industrial and transport systems, and that even then it may not be decisive. He says, for example, that to transport 8,000,000 tons of oil every year from the Caucasus to Germany would require no fewer than 55,000 tank cars, or about twice as many of such cars as Russia now possesses. To haul the 2,351,000 tons of soya beans from Manchuria to Germany—a distance of 4,300 miles—would require 325 trains containing 16,250 freight cars constantly under load, not counting the return journey. Professor Hopper concludes that the delivery to Germany of oil, soya beans, and manganese ore is an undertaking which would tax the Soviet facilities and, except in the case of manganese ore, could be executed only in part. In a short war of big offensives, Russia could not give decisive aid to Germany, but if the war lasts for two years without major engagements, Germany might be able to accumulate war stocks and reorganize Soviet industry and transport so that Russian aid might be of great value. With the exception of the United States, there is no country which enjoys such a degree of self-sufficiency as Russia to-day. Not only does she produce her own food, but can satisfy her own requirements in coal, iron ore, and petroleum. She requires only tungsten, nickel, antimony, tin, and natural rubber among raw materials. It is, however, her deficient transport that prevents the mobilization of her resources. (See also ECONOMIC WARFARE; INDUSTRY, WAR CONTROL OF; WAR FINANCE.) (G. F. S.)

WELFARE AGENCIES, WAR. In spite of months of preparation for the possibility of war, no period in the modern history of Great Britain witnessed a greater upheaval in the national way of life than occurred immediately upon the outbreak of war with Germany on Sept. 3, 1939. To cope with the many problems in re-adjustment arising from both the redistribution of population and the nervous tension induced by the new technique of warfare there was an expanding need for organized welfare work. By far the largest share in this was borne by the Women's Voluntary Services for Civil Defence. Born in 1938, under the chairmanship of the Dowager Marchioness of Reading, the W.V.S. had grown by May 1939 to a strength of

256,000, and by the first fortnight of the war to double that number. When the order was given to evacuate the danger areas 200,000 members assisted in the vast movement of population. (See EVACUATION.) In the reception areas the W.V.S. had three main tasks—allocation of buildings, reception at railheads and dispersal to billets, and care after arrival. The continuing after-care entailed nine separate activities—management of buildings, transport, feeding, health, recreation, clothing, maternity care, infant welfare, and general advisory services. A.R.P. instruction was another important activity, but the biggest development in W.V.S. work was in the establishment of canteens for civil defence workers and evacuees.

Another welfare agency established after the outbreak of war was a group of citizens' advice bureaux offering help in solving wartime problems.

Of special importance in a war which, in its beginnings at least, seemed to be one of attrition was the entertainment of the defence forces. In September the Navy, Army, and Air Force Institutes, which are responsible for an extensive canteen service, organized an entertainments branch known as the Entertainments National Service Association (E.N.S.A.), with Mr. Basil Dean as director and Sir Seymour Hicks as controller. Twelve concert parties sent to the camps on Sept. 25 provided 82 performances for 45,663 men in their first week. In October six mobile cinemas were provided, and later the amount of entertainment both living and mechanical greatly increased. The total number of performances given up to Dec. 10 was 2,973, the attendances amounting to 1,159,895. On Nov. 15 the war office gave permission for entertainment to start in France, and in the following three weeks 47 living performances and 32 cinema shows were given, providing entertainment for 61,490 men.

An extensive welfare programme on behalf of the forces was also undertaken by the Y.M.C.A., more than 420 branches serving the men in the home field, and 24 operating with the B.E.F. For isolated units at home 47 mobile canteens were at work by the end of December. Canteens were also opened at London termini and provincial railway stations. A comprehensive educational scheme for troops at home and overseas, and plans for work among prisoners of war were other phases of Y.M.C.A. activity. The war service fund appeal under the leadership of Lord Athlone received gifts totalling £130,000.

Other organizations undertaking canteen and general welfare services both at home and abroad included the Church Army, the Salvation Army, the Youth Fellowship, and the Y.W.C.A. In France, *Le Foyer du Soldat* was providing for the French forces comforts similar to those afforded by the Y.M.C.A.

A new scheme for the welfare of British soldiers, to be called the Social Welfare Scheme for the Troops, was announced by Mr. Hore-Belisha, minister for war, in November. The aim of this was to ensure that every soldier in home territory should be given as many comforts and amenities as possible. By the end of the year the scheme had already begun to operate, with Lt.-Gen. Sir John Brown as war office adviser under the adjutant-general.

Many organizations receiving gifts for men in the forces or in other war service sprang into being directly the war began, and their work was centralized under Sir Alan Hutchings, director-general of voluntary organizations, Berkeley Square House, London. The collection and distribution of books and periodicals for the defence forces

¹ *Foreign Affairs*. New York, No. 2. (January 1940). "How much can and will Russia aid Germany?"

was co-ordinated in November under the City of London Territorial Army and Air Force Association.

In December two committees were set up in London and Paris to send gifts of materials to the wives of French soldiers in France and gifts to the British Expeditionary Force, and to assist in entertaining British soldiers on leave in France. The gifts included 3,000,000 cigarettes to France and 12,000 to home stations. Earlier, 1,000,000 cigarettes had been provided for British troops through Lord Nuffield's gift of £1,000 to the Overseas League Tobacco Fund. Lord Nuffield also gave £1,000 to the Veterans' Association to provide at the Allenby (Services) Club entertainment and recreation for soldiers passing through London.

For the welfare of internees and prisoners of war a joint committee was formed in Great Britain with the approval of the home office and war office. (D. A. C.)

WOMEN'S WAR ORGANIZATIONS. During 1939 the special qualities which women can bring to public service acquired an importance unprecedented even in the years 1914-18. In the early months of the year, when war was smouldering in Europe, there was a strong impulse among British women of all ages and classes to contribute

Fox Photos]

STUDENTS IN TRAINING FOR THE WOMEN'S LAND ARMY

to their country's defence needs, and when the conflict came in September it found a large force of women already members of the Service organizations. (See WELFARE

AGENCIES, WAR.) Twenty thousand had enrolled in the Auxiliary Territorial Service alone since it was constituted in Sept. 1938; in Nov. 1939 began the recruitment of a further 20,000, and in the first fortnight after the war office appeal nearly 10,000 applied for enrolment. Dame Helen Gwynne-Vaughan, chief controller of the A.T.S., with the rank of major-general, supported the recruiting drive by a broadcast appeal. On Dec. 14 she visited the British lines behind the Western front, with the object, it is understood, of determining what part the A.T.S. might carry out with the British troops.

In July 1939 the Women's Auxiliary Air Force was constituted a separate service from the A.T.S., of which it was originally a branch, and on July 2 members appeared for the first time in their uniforms of R.A.F. blue at the national defence rally in Hyde Park. Miss J. Trefusis Forbes was appointed director of the W.A.A.F. at the air ministry, with the rank of senior controller.

Originally formed in 1917, the Women's Royal Naval Service was revived in April, 1939, under the directorship of Mrs. Laughton Mathews, who holds rank equivalent to that of rear-admiral. Within six weeks of the outbreak of war so many applications had been received for membership that it was necessary to suspend recruiting. By comparison, however, with other women's organizations the Women's Royal Naval Service is a small, though carefully selected and highly trained force, at the close of 1939 the number of W.R.N.S. actually at work being still well under 5,000. Accepted candidates are posted to naval establishments within the four main commands, The Nore, Devonport, Portsmouth and Rosyth.

As in the Great War, the important field of activity afforded by the Women's Land Army attracted large numbers of recruits. Following on the inclusion of the Women's Land Army in the national service appeal in Jan. 1939, about 18,000 women had applied for enrolment by September. About half of these were enrolled by the beginning of the war. By Nov. 30, 20,000 out of 29,000 applicants were enrolled as members. Between the outbreak of war and the end of November some 3,500 volunteers received training at government expense, and 2,800 had been placed in agricultural employment through the land army organization for England and Wales. In Scotland 1,051 volunteers were enrolled by the end of December. (See also AIR RAID PRECAUTIONS; HOSPITALS; WELFARE AGENCIES, WAR, for information about women's work in nursing, civil defence, and voluntary services.) (D. A. C.)

INTRODUCTION

THE third issue of the *Britannica Book of the Year*, covering the year 1939, was prepared during months of war. The manuscripts from abroad were delayed in transmission to this country: the hand of the censor opened envelopes even if it did not actually modify the text inside (and there was no physical evidence that it did); typed contributions in slow and cautious ships slipped by the grim U-boat and the secret mine to reach these peaceful shores. Embattled Europe affected in many ways the gathering together of this record of events of an exciting year even as it has affected the events themselves in every field of interest.

The days men live and the things they do make an interesting book any year. Each month moves to climax and to climax and to climax again. The characters appear to be good or bad and the events and achievements potentially good or bad as the reader judges them. The *Book of the Year* presents these characters and their activities, so far as possible, with photographic impartiality. This is not an easy thing to do. Editors and contributors know this and they work with a conscientious endeavour to do no more than to report what has happened.

The *Britannica Book of the Year* is released with concern that the tragedy of war colours so much of the record it bears, but with sincere hope too, that next year's volume will bring news of a world in which peace is found again, with honour to all peoples: a lasting peace, as it should be in a world where peace between men must be civilization's final justification.

The Editor.

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPAEDIA BRITANNICA

LIBRARIAN CONSULTANTS

ANNE FRASER LEIDENDEKER, *Department Librarian, Science and Industry Department, Public Library, Los Angeles, Calif.*

CHARLES F. MCCOMBS, *Superintendent, Main Reading Room, New York Public Library.*

WINIFRED VER NOOY, *Reference Librarian, University of Chicago.*

(Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.)

A.Ag.	ALEXANDER ARMSTRONG. President, National Conference of Commissioners on Uniform State Laws.	Conference of Commissioners on Uniform State Laws

"QUEEN ELIZABETH," largest liner afloat, was secretly fitted out in Scotland during 1939 for her surprise maiden voyage across the Atlantic in March 1940. View (Wide World) shows her nearing New York.

CALENDAR OF EVENTS, 1939

For elections, disasters, and assassinations of 1939, see under those headings in the text. For obituaries of prominent persons who died during 1939, see under the entry Obituaries.

JANUARY

1 Chiang Kai-shek ordered arrest of approximately 200 followers of Wang Ching-wei, former premier expelled from Chinese Gov't for attempted peace negotiations with Japan.

2 Frank Murphy succeeded Homer S. Cummings as U.S. attorney general.

Premier Daladier began "colonial solidarity" tour with visit to Ajaccio, Corsica.

3 Seventy-sixth U.S. Congress convened; report of Senate's committee on campaign expenditures charged use of WPA funds for political purposes in three States.

4 Adequate national defence and preservation of democracy against encroachments of authoritarian States urged by Roosevelt in message to Congress on state of the Union.

Cabinet of Fumimaro Konoye resigned; Baron Kiichiro Hiranuma named Japanese premier.

5 Deficit of \$3,326,000,000 for fiscal year 1940 estimated by Pres. Roosevelt in annual budget message to Congress.

Felix Frankfurter appointed associate justice of U.S. Supreme Court to succeed the late Benjamin N. Cardozo.

Spanish Gov't troops seized mountain chain in surprise offensive on Estremadura front; Insurgents captured Borjas Blancas in Catalonia.

6 Czech and Hungarian troops clashed near Munkacsvo on new Ruthenian frontier.

7 Thomas J. Mooney pardoned by Gov. Culbert Olson of California after 22 years' imprisonment for alleged implication in San Francisco bombing.

Roosevelt in Jackson Day dinner address pleaded for unity in Democratic Party and invited dissentient Democrats to join Republicans.

9 New Reich Chancellery dedicated by Adolf Hitler in Berlin.

10 Ambassadors Joseph P. Kennedy and William C. Bullitt warned joint congressional committee on military affairs of imminent European war.

11 Lincoln Ellsworth claimed 81,000 sq.mi. of newly-discovered land in Antarctica for U.S.A.

12 Chamberlain concluded two-day visit to Mussolini with "no new commitment, arrangement or agreement."

13 House of Representatives reduced relief deficiency appropriation from \$875,000,000 requested by Roosevelt to \$725,000,000; the Senate approved the reduction on January 27 by 47 to 46 vote.

14 British note to Japan protested against violation of Nine-Power treaty, but offered to negotiate modifications to pact.

15 Tarragona fell to Spanish Insurgents in steady drive of Gen. Franco's troops toward Barcelona.

16 Bombings in Manchester, Liverpool, Belfast, and London attributed to terrorists of outlawed Irish Republican Army.

17 U.S. Senate confirmed appointments of Felix Frankfurter as associate justice of Supreme Court and Frank Murphy as attorney-general.

19 Repeal of taxation immunity of public employees recommended by Pres. Roosevelt in message to Congress.

20 Hitler removed Dr. Hjalmar Schacht as president of Reichsbank and appointed Walther Funk to succeed him.

Homer Martin expelled 15 members of United Automobile Workers' executive board and seized files of union.

21 Field Marshal Goering invited George Rublee, director of Intergovernmental Committee on Refugees, to resume Jewish emigration conferences interrupted by dismissal of Dr. Hjalmar Schacht.

22 All officers of German army ordered to join the Reich Warrior League, political unit of the National Socialist party.

23 Martial law decreed in Barcelona as Insurgent

troops pushed to within 12mi. of Loyalist capital.

Harry L. Hopkins confirmed as Sec'y of Commerce by 58 to 27 vote of Senate after bitter debate on qualifications.

National health program, to cost \$850,000,000 annually, submitted by Pres. Roosevelt to Congress for study.

U.S. Army pursuit plane attained speed of 575 m.p.h.—fastest man has ever travelled—in power dive during test at Buffalo.

24 C.I.O. announced it would support Homer Martin's opponents in internal strife of United Automobile Workers' Union; Martin resigned from the C.I.O. executive board January 25.

25 Loyalist Gov't fled to Gerona and Figueras as Insurgent troops surrounded Barcelona and cut off escape of refugees.

26 Barcelona surrendered to Gen. Franco's troops without struggle.

French Gov't refused to accept appointment of Masayuki Tani as Japanese Ambassador to France.

27 Pres. Roosevelt revealed he had authorized purchase by France of large number of most modern American fighting planes; Senate military affairs committee requested explanation of presence of French aviation representative aboard latest-type light bomber which crashed January 23.

28 The democracies would unite in resisting any "demand to dominate the world by force," asserted Prime Minister Chamberlain in address at Birmingham.

Lord Chatfield succeeded Sir Thomas Inskip as British minister for co-ordination of defence; Inskip became Dominions sec'y and Sir Reginald Dorman-Smith minister of agriculture.

29 Thousands of Spanish refugees crossed French border in mass trek as Franco's army marched through northern Catalonia with scant resistance.

30 Germany "wants peace and quiet," but is determined to regain colonial possessions, Hitler declared in Reichstag speech; he denied religious persecution in Germany, criti-

cized "warmongers" in the democracies, especially the U.S.A., and pledged armed help to Italy if latter were to become involved in war "regardless of its motives."

Martin T. Manton, senior judge of U.S. Circuit Court of Appeals, second district, resigned after charges of accepting money from litigants in his court; he was later indicted (March 2).

U.S. Supreme Court dismissed suit of 14 private utilities to enjoin competitive activities of Tennessee Valley Authority.

31 America's frontier is in France, Pres. Roosevelt reportedly told Senate military affairs committee; he outlined practical measures by which U.S.A. would help France and Great Britain in war.

FEBRUARY

1 Roosevelt's declaration of support for European democracies provoked bitter debate in Senate; German and Italian newspapers attacked statement as war agitation.

2 U.S. State Dept. announced British waiver of agreement on reciprocal schedule for transatlantic air service, thus permitting American lines to begin flights at any time.

Premier Paul-Henri Spaak of Belgium beaten by mob of war veterans who protested his appointment to academy of medicine of physician convicted as German sympathizer during World War.

U.S.S.R. severed diplomatic relations with Hungary after latter nation had joined anti-Comintern pact.

3 Roosevelt denied published reports that he had declared American frontier to be in France; he said U.S.A. is against any foreign alliances and favours disarmament, share in world trade for all nations, and "political, economic, and social independence" of every State.

Dies committee investigation on un-American activities extended for year by House of Representatives, 344 to 35.

William Phillips, U.S. Ambassador to Italy, protested invectives in Fascist press against Pres. Roosevelt.

4 Renewed frontier clashes on Soviet-Japanese border

FEBRUARY—Continued

near Manchuli reported by Manchoukuoan Gov't.

TVA agreed to purchase properties of Commonwealth and Southern Corporation in Tennessee for \$78,000,000.

5 France opened border at Perthus to retreating Loyalist army, estimated at 200,000 men.

6 Dragisha Cvetković sworn in as Yugoslav premier to succeed Milan Stoyadinović, who resigned February 4.

U.S. Senate rejected appointment of Floyd H. Roberts as district judge of Virginia, 72 to 9; the action touched off a bitter verbal battle between Pres. Roosevelt and Sen. Carter Glass.

Franco demanded unconditional surrender of Loyalists with no guarantee of plebiscite or of amnesty for Gov't leaders.

7 Foreign Minister Alvarez del Vayo announced Loyalists would continue resistance to Insurgents in central and south-eastern Spain.

Palestine conference opened in London; Prime Minister Chamberlain pleaded for reconciliation between Jewish and Arab delegations.

Roosevelt requested additional \$150,000,000 to restore cut in original \$875,000,000 WPA deficiency appropriation.

U.S.S.R. and Italy resumed commercial relations severed since 1937.

8 Gen. José Miaja, commander of Loyalist defenders of Madrid, asked French Gov't for a safe conduct.

9 Oswaldo Aranha, Brazilian foreign minister, arrived in U.S.A. on "good-will" tour.

Island of Minorca surrendered to Spanish Insurgents after peace negotiations aboard British cruiser, which later evacuated 450 Loyalists.

Alex Henshaw, British flyer, broke all speed records from England to Cape Town, making round trip in 4 days, 10 hours, 16 minutes.

Taxation of all Federal, State, and municipal employees voted

by House of Representatives, 269 to 103.

Premier Paul-Henri Spaak of Belgium resigned.

Sec'y of Treasury Morgenthau declared U.S. stabilization fund had made net profit of \$12,000,000 since 1934.

10 Pope Pius XI died at Vatican City; he was buried in the crypt of St. Peter's February 14.

Japanese occupation of Hainan island imperilled British and French defences of possessions in Far East.

11 Loyalist cabinet met in Valencia to reorganize administration in central Spain; Gov't moved to Madrid February 12.

12 Nazi plan for systematic emigration of German Jews disclosed by George Rublee at meeting of Intergovernmental Committee on Refugees in London; proposal envisaged permitting Jews to earn living while waiting to emigrate.

13 Justice Louis D. Brandeis retired from U.S. Supreme Court.

14 French military mission in U.S.A. announced purchase of 500 additional U.S. war planes.

Germany's first 35,000-ton battleship, the "Bismarck," launched at Hamburg.

15 House of Representatives voted 367 to 15 to add 3,000 planes to U.S. air force; Senate increased total number to 6,000 on March 7.

Great Britain announced it would build two more battleships, bringing total under construction to 9.

Bela Imredy, anti-Semitic premier of Hungary, resigned after admitting truth of charges that his great-grandfather was a Jew; Count Paul Teleki formed new cabinet February 16.

16 Wayne C. Taylor resigned as Assistant Sec'y of Treasury after reported rift over Gov't policy of extending credit to foreign nations.

17 No new taxes contemplated, said Pres. Roosevelt in press conference en route to

inspect fleet manoeuvres in Caribbean.

George Rublee resigned as director of Intergovernmental Committee on Refugees.

18 Golden Gate International Exposition opened at San Francisco.

19 Peruvian troops speedily subdued revolt during absence of Pres. Benavides; Gen. Antonio Rodríguez, leader of the attempted coup, was slain.

20 U.S. Navy began war games in Atlantic and Caribbean.

Mass meeting of 22,000 members of German-American Bund in New York city precipitated disorders and drew large crowds of anti-Nazis to scene.

21 Legal borrowing limit of British Gov't extended to £800,000,000 by House of Commons to pay for expenses of rearmament in 1939-40.

Existence of U.S. Export-Import Bank extended to June 30, 1941 by House of Representatives, 280 to 77.

Japanese planes bombed British railroad station in Hongkong, killing Indian policeman and wounding others.

"King George V," new British 35,000-ton capital ship, launched by King George VI at Newcastle.

22 Unidentified ship radioed S.O.S. that it had been torpedoed by unknown submarine south of Azores; search for sinking vessel proved fruitless.

23 Bill to fortify Guam defeated by House of Representatives, 205 to 168.

24 Sec'y of Commerce Hopkins said in Des Moines address that New Deal had shifted emphasis of its economic program from reform to recovery and was determined to encourage private business and capital.

Hungarian Nazi organization dissolved and leaders jailed.

25 Pres. Roosevelt requested John L. Lewis and William Green to negotiate "peace with honour" between C.I.O. and A.F. of L.; Green accepted proposal same day; Lewis on February 28.

James J. Hines found guilty on 13 charges of participation in "numbers" racket; he was sentenced to serve four to eight years in prison March 23.

Polish students attacked German embassy at Warsaw but cheered Count Galeazzo Ciano, Italian foreign minister on visit of State.

Italian citizens began mass repatriation from France.

26 British Gov't announced to Arab-Jewish Conference in London that it proposed to relinquish mandate over Palestine and set up independent State; Jewish delegates rejected plan next day.

27 France and Great Britain granted unconditional recognition to Franco's Gov't.

Sit-down strikes outlawed by decision of U.S. Supreme Court, 5 to 2.

28 Manuel Azaña resigned as president of the Spanish republic.

MARCH

1 U.S. Air Force consolidated under direction of Maj. Gen. Henry H. Arnold.

2 Eugenio Cardinal Pacelli elected pope on second day of cardinals' conclave; he selected title of Pius XII.

Marshal Philippe Pétain appointed French Ambassador to Franco's Gov't.

3 Pius XII expressed "hope and appeal for peace" in first public address.

Gen. Robert E. Wood appointed adviser to Sec'y of Commerce Hopkins.

4 Democratic form of government extolled by Pres. Roosevelt and Chief Justice Hughes in addresses celebrating 150th anniversary of U.S. Congress.

MARCH—Continued

Laurence A. Steinhardt appointed U.S. Ambassador to Russia.

Japan claimed capture of Haichow in new intensive campaign against guerrillas in northern China.

5 Juan Negrin ousted as premier of Republican Spain by Gen. Segismundo Casado, army chief, who formed national defence council; revolt against Loyalists at Cartagena naval base suppressed.

6 Gen. José Miaja became president of Madrid's defence council; Communists began series of revolts against new Gov't.

Japan announced six-year naval building program to cost 1,700,000,000 yen and give nation parity with U.S. and Britain.

7 C.I.O. proposed formation of a single federation of American labour.

Armand Calinescu appointed premier of Rumania after death of Miron Cristea the preceding day.

United Automobile Workers' union, with Homer Martin as president, formally seceded from the C.I.O.

Spanish Republican fleet of 11 vessels voluntarily interned at Bizerta, French naval base in Tunisia.

Mohandas Gandhi ended four-day fast in protest against autocracy of Thakore Saheb of Rajkot; British viceroy agreed to submit dispute to Chief Justice of India.

8 Nineteen divisions of 300,- 000 British troops would be sent to France in event of war, Leslie Hore-Belisha announced to House of Commons.

Great Britain granted £5,000,000 credit to China to support the Chinese dollar.

LEBRUN.....Apr. 5

Cochran-Warren reorganiza- tion bill passed by House of Representatives, 246 to 153; Senate approved, 63 to 23, on March 22.

Palestine Conference meet- ings suspended by order of British Gov't.

9 U.S.-Brazilian commer- cial agreements concluded at Washington; terms provided for extension of more than \$100,000,000 in credit to Brazil.

10 Premier Josef Tiso of Slovakia ousted by Czech Gov't; he addressed appeal to Hitler for assistance in proclaiming complete independence of Slovakia from Prague.

Stalin, in opening address before 18th Communist Party congress in Moscow, accused democracies of attempting to provoke Soviet-German war.

11 Dr. Karl Sidor named premier of Slovakia as German troops massed on border near Bratislava.

Luigi Cardinal Maglione ap- pointed papal secretary of state by Pius XII.

12 Pope Pius XII crowned on balcony of St. Peter's.

13 German ultimatum to Prague reputedly demanded division of nation into three "independent" states.

14 Republic of Czecho-Slo- vakia collapsed as Slovakia and Ruthenia declared independence; Hungarian troops began occupation of Ruthenia after skirmishes with Czech troops; Josef Tiso reinstated as Slovakian premier.

15 Dr. Emil Hacha "re- quested" German protectorate over Czecho-Slovakia, which nation Hitler thereupon proclaimed non-existent; Hitler, preceded by German troops, entered Prague.

16 Hitler proclaimed pro- tectorate over Bohemia and Moravia and assumed protection of Slovakia at invitation of Josef Tiso; Hungary formally announced annexation of Ruthenia.

17 British ambassador to Berlin recalled for consultation; Chamberlain condemned Germany's disregard of written pledges.

U.S.A. refused recognition of German protectorates over Bohemia, Moravia, and Slovakia; note of State Dep't called occupation an act of "wanton lawlessness and arbitrary force."

18 Dictatorial powers to rule by decree granted Premier Daladier by Chamber of Deputies; French ambassador to Berlin ordered to return to Paris.

Increase of 25% on German import duties announced by U.S. Treasury.

Germany rejected French and British protests over annexation of Czecho-Slovakia; Nazi foreign office recalled ambassador to London; Baron Constantin von Neurath named Reich protector of Bohemia and Moravia.

19 Soviet note to Berlin declared seizure of Czecho-Slovakia illegal and withheld Russian recognition.

Berlin welcomed Hitler as "aggrandizer of the Reich" upon his return from tour of Bohemia.

20 British Gov't announced that it was "in direct consultation with other governments" to form anti-Fascist bloc.

William O. Douglas nomina- ted to Supreme Court by Pres. Roosevelt; he was confirmed by Senate April 4.

Pres. Roosevelt abandoned request for increase in limitation of \$45,000,000,000 on U.S. public debt, but asked Congress to increase \$30,000,000,000 limit on amount of bonds that may be outstanding at one time.

21 Italian Fascist Grand Council voted approval of Germany's territorial seizures and warned that an anti-Fascist coalition of democracies would "herald war."

Pres. Albert Lebrun of France arrived in London on state visit; both he and King George VI reaffirmed Franco-British identity of interests.

22 Lithuania yielded Memel to German Empire; Reich agreed in formal treaty to give Lithuania access to city as free port.

23 Hitler made triumphal entry into Memel.

Hungarian troops invaded eastern Slovakia shortly after treaty was signed at Berlin in which Germany guaranteed "political independence and integrity" of Slovakia for 25 years.

Reich concluded five-year trade treaty with Rumania.

King Victor Emmanuel opened new Italian Chamber of Fasces and Corporations with speech in which he avoided direct mention of French-Italian controversies and emphasized Rome's desire for peace.

24 Postponement of in- crease in U.S. social security taxes and reduction of fund's reserve recommended by Sec'y of Treasury Morgenthau.

Earl Durand, Wyoming mountaineer, shot self after eight-day man hunt during which he killed four men.

House of Representatives tabled resolution which sought to impeach Sec'y of Labor Frances Perkins.

25 Hitler declared "the German people stand shoulder to shoulder with the battle-proved Italian nation."

26 Mussolini suggested that France initiate discussions to solve "problems of Tunisia, Jibuti, and the Suez Canal."

27 "Yankee Clipper," with 21 aboard, landed in Azores on first lap of inspection flight for regular transatlantic service.

Investigation of WPA ordered by House of Representatives, 352 to 27.

Nan-chang captured by Japanese troops.

28 Madrid surrendered to Franco's troops without resistance after 29-month siege.

Reduction of \$250,000,000 in payments for farm price parity in 1940 voted by House of Representatives.

29 Spanish civil war ended after 32 months of fighting; Loyalists surrendered all remaining territory in south-eastern Spain.

Premier Daladier, in interna- tional broadcast, declared negotiation with Italy was impossible without knowing nature and extent of Italian demands; he reiterated his statement that

MARCH—Continued

France would yield neither land nor rights.

Prime Minister Chamberlain announced in House of Commons that British Territorial Army would be increased to 340,000 by voluntary enlistment.

30 Nazi conspiracy to seize Patagonia charged by Argentina after revelation of secret document reputedly signed by counsellor of German embassy in Buenos Aires.

31 Immediate military assistance to Poland in event of aggression pledged by Great Britain and France; British action marked historic departure from policy of non-interference in eastern European affairs.

Japan annexed Spratly islands in South China Sea, formally claimed by France in 1933.

Enforcement of new prohibition law in Bombay led to riots in which more than 40 were injured.

2 Great Britain signed treaty granting Poland credit of £8,163,000 for military supplies.

U.S. Army Air Corps celebrated 30th anniversary of purchase of first plane.

3 \$800,000,000 Housing bill killed by House of Representatives, 191 to 170.

Sen. Robert A. Taft (Rep.) of Ohio, declared his candidacy for Presidential nomination in 1940.

National Guardsmen moved into Green Mountain dam district in Colorado after rioting by strikers, who returned to work next day.

Woman refugee from Czechoslovakia threw herself and two children from 13th floor of Chicago hotel.

4 Settlement of C.I.O. strike of automobile tool and die workers in Detroit announced by U.S. conciliator; strikers ratified pact next day.

AUGUST—Continued

House of Commons adjourned; Chamberlain said the situation in the Far East "makes my blood boil."

5 First session of 76th U.S. Congress adjourned *sine die*; total appropriations during session exceeded \$13,000,000,000.

Congress passed \$185,000,000 deficiency bill, including \$119,000,000 for Commodity Credit Corporation; it also amended Social Security Act to maintain payroll tax at 1% until 1942, begin payment of old-age annuities in 1940, include only first \$3,000 of incomes in unemployment tax, increase Federal contributions to States for old-age benefits, and extend provisions of act to seamen and agricultural labourers.

U.S. Army began two-week manoeuvres.

Princess of Orange-Nassau, second daughter of Crown Princess Juliana of the Netherlands, born at The Hague; she was named Irene Emma Elizabeth.

6 Marshal Smigly-Rydz, in speech at Cracow, said Poland would defend its integrity against any attack, direct or indirect.

Spanish Gov't announced execution of 53 persons accused of complicity in slaying of civil guardsman July 29.

Imperial Airways plane landed at Pt. Washington, L.I., to inaugurate British transatlantic mail service.

7 Danzig Senate agreed to negotiate dispute with Poland over administration of customs.

Saudi Arabia granted petroleum concessions for entire kingdom to Standard Oil Company of California.

Credit of about \$13,750,000 to Spain for purchase of U.S. cotton announced by Export-Import Bank.

Military manoeuvres in northern Italy ended before schedule.

Richard W. Leche, ex-governor of Louisiana, indicted on Federal charges of violating "hot-oil" act.

8 Nazi press unleashed violent attacks on Poland following address of Smigly-Rydz in Cracow August 6.

Self-sacrifice is a necessary pre-requisite to national and international peace, declared Pope Pius in a letter to French Canadian Catholics signed by

Cardinal Maglione, papal sec'y of state.

Henry F. Grady sworn in as assistant U.S. sec'y of state.

9 Yugoslavia refused Axis' demand for conscription of her economic and military facilities in event of war, according to American press dispatch from Belgrade.

Civilian advisory committee of six members for mobilization of U.S. economic resources in time of war announced by Departments of War and Navy.

Ramon Serrano Suñer appointed political chief of the Spanish Falange council.

Dirk Jan de Geer formed coalition cabinet in the Netherlands.

10 Albert Forster, Nazi leader of Danzig, declared in speech after visit with Hitler that Danzig's "liberation" might be near at hand.

Roosevelt threatened to bolt Democratic party in 1940 if it nominated "conservative candidates on a straddlebug platform."

11 Count Ciano and Joachim von Ribbentrop, Italian and German foreign ministers, began two-day conference in Berlin.

Secret meeting took place between Hitler and Dr. Karl J. Burckhardt, League of Nations high commissioner for Danzig, at Berchtesgaden.

Mendelssohn & Co., Amsterdam bank, suspended payments after death of director.

Moe L. Annenberg, publisher of The Philadelphia Inquirer and of "tip sheets" for horse racing, indicted for alleged evasion of \$3,258,810 in U.S. income taxes.

Britain announced it would surrender to Japan the four Chinese whose detention precipitated Tientsin incident.

12 Franco's new cabinet sworn in at Burgos.

British and French military missions began conversations with Russian staff in Moscow.

13 King Farouk of Egypt accepted resignation of Premier Mohamed Mahmud Pasha.

14 Pres. Roosevelt announced he would proclaim Thanksgiving Day for 1939 on November 23 instead of November 30.

Young Russian artist who stole Watteau's "L'Indifférent"

from the Louvre returned it after "correcting errors of earlier restorations"; experts praised his work in restoring painting.

15 José Estigarribia inaugurated as president of Paraguay.

16 Earl Baldwin of Bewdley declared in New York address that citizens of democracies should be ready to die for their ideals.

Nazi spokesman asserted Germany would demand whole of Polish Corridor but would offer Poland free access to sea.

Territory adjacent to Hongkong occupied by Japanese troops.

17 Proposed British settlement of Palestine question criticized by League of Nations' Permanent Mandates Commission as "not in accordance" with the terms of the mandate.

18 Germany assumed military control of Slovakia.

Great Britain refused Japanese demand that it surrender store of Chinese silver and prohibit circulation of Chinese currency in Tientsin before consulting other interested nations.

France granted Poland credit of 430,000,000 francs for purchase of war materials.

Aly Maher Pasha formed new cabinet in Egypt.

19 Germany and U.S.S.R. signed seven-year trade agreement.

British sergeant in Shanghai killed two and wounded six Japanese-controlled Chinese policemen who fired upon him.

Pope Pius XII appealed to European powers not to assume "the inexpressible responsibility of . . . force."

20 Poland shifted large numbers of troops to protect Slovakian and Moravian frontiers.

Japanese blockade of British concession in Tientsin broken by Hai river floods.

21 Announcement in Berlin of 10-year non-aggression pact between U.S.S.R. and Germany caused consternation in world's capitals.

22 British cabinet announced the German-Soviet treaty "would in no way affect their obligations to Poland"; Parliament summoned to meet August 24.

23 Great Britain warned Germany, in message dated August 22 and delivered by Sir Neville Henderson, that it was determined to fulfil pledges to Poland; Hitler's reply insisted upon free hand in eastern Europe.

Seven-power conference of "Oslo group" met at Brussels; King Leopold of Belgium broadcast appeal for peace.

Gen. Carlos Quintanilla assumed presidency of Bolivia after suicide of Pres. Germán Busch.

Nine-day milk strike in New York city ended by vote of dairy farmers' union.

New world's automobile speed record of 368.85 m.p.h. established by John Cobb at Bonneville Salt Flats, Utah.

24 Nazi-Soviet non-aggression pact signed in Moscow; it provided that each should refrain without reservation from attacking the other, that neither should join powers aimed at the other, and that both should remain in constant consultation on questions of common interest.

British parliament met and passed emergency powers bill for Government to rule by decree; Chamberlain declared war imminent but still hoped for "a way out"; he called Russia's action a "very unpleasant" surprise.

Adolf Hitler returned to Berlin from Berchtesgaden and held lengthy conference with Goering, Goebbels, and military chiefs.

Roosevelt appealed to Hitler and President Moscicki of Poland to settle their controversies by direct negotiation, arbitration, or conciliation; in another message, he urged King Victor Emmanuel of Italy to intervene on behalf of peace.

France urged all Parisians to leave city immediately unless their presence was indispensable.

Albert Forster elected head of Gov't of Danzig to replace Arthur Greiser.

Japanese Foreign Minister Hachiro Arita said Japan's revised foreign policy was one of "independence without relying upon any other power."

Second peace message within five days broadcast by Pope Pius XII.

Louis Lepke, object of nationwide manhunt, surrendered to Federal agents in New York city.

AUGUST—Continued

British railway workers called off strike scheduled for midnight August 26.

George L. Carpenter elected general of Salvation Army to succeed Evangeline Booth.

25 Hitler requested conference with Sir Nevile Henderson and, according to British *White Paper* of September 1, told British ambassador he was "determined to abolish Macedonian conditions in Poland"; but was willing "to approach England with a large and comprehensive offer" which would "guarantee the existence of the British Empire," provided Britain would agree to negotiate his "limited" colonial demands and not ask revision of his obligations toward Italy and Russia.

Poland and Great Britain signed five-year military alliance in London.

German Gov't severed communications between Berlin and European capitals and cancelled celebration at Tannenberg scheduled for August 27.

Pres. Moscicki of Poland replied to Pres. Roosevelt that his nation stood ready to negotiate directly with Germany; Roosevelt then addressed second message to Hitler asking him to adopt pacific settlement also.

Japanese ambassador to Berlin ordered to file protest with German Gov't against signing of Nazi-Soviet pact.

French army engineers removed pontoon bridges across Rhine.

Premier Daladier declared that a betrayal of Poland by France would leave France without friends or support.

Martial law proclaimed in Chile after abortive military revolt.

26 Sir Nevile Henderson flew to London to present Hitler's verbal message of August 25 at cabinet meeting.

Serbo-Croat accord granted Croatia separate parliament and established freedom of press and assembly in Yugoslavia; new cabinet of Dragisha Cvetković included Dr. Vladimir Matchek as vice-premier, and five other Croats.

British and French military missions left Moscow.

Rationing of food and clothing decreed throughout Germany; Nazis cancelled Nuremberg party congress.

Germany's ministers to Switzerland and the Netherlands and its ambassador to Belgium assured these countries that the Reich would respect their neutrality in general war.

Hungary rejected Rumania's proposal for non-aggression pact but offered to negotiate treaty guaranteeing rights of minorities in both countries; this counter-proposal was rejected by Rumania next day.

Betty Jameson won U.S. women's national golf championship.

27 Hitler, in reply to letter of August 26 from Daladier which suggested direct negotiations between Berlin and Warsaw, demanded return of both Danzig and the Polish Corridor; German propaganda ministry accused Daladier of misinterpreting Fuehrer's letter.

Reichstag convened in secret session to be addressed by Hitler.

Mussolini responded to Canadian Prime Minister King's plea for peace that he would bend every effort to forestall war.

28 British cabinet completed reply to Hitler's communications of August 23 and 25; as published in British *White Paper* of September 1, this note requested direct negotiations between Germany and Poland and offered to discuss Hitler's proposal for a "general understanding" regarding the British Empire after the differences between Germany and Poland had been peacefully composed.

French-German frontier closed; the Netherlands mobilized; Switzerland and Belgium called up more troops.

Polish official statement condemned German press stories of mistreatment of German minority as "untrue and entirely imaginary."

Bratislava occupied by German troops.

German liner "Bremen" detained and searched for offen-

sive weapons in New York harbour; it did not sail until August 30.

Gen. Nobuyuki Abe appointed Japanese premier after resignation of Kiichiro Hiranuma's cabinet; Tokyo press pointed out possibility of more amicable relations with Great Britain and the United States.

British merchant ships ordered by Admiralty to leave Mediterranean and Baltic; Canada established national control of shipping.

Seven Japanese aviators landed in Nome, Alaska, on first lap of flight around the world.

29 Hitler's reply to British message of August 28 telephoned to London; as reported in the British *White Paper* of September 1, it accepted British proposal for direct discussions providing a Polish emissary "with full powers" should arrive at Berlin August 30; Hitler denied this was an ultimatum.

Chamberlain, in speech before Commons, criticized press for placing its own interpretations on German-British exchange of communications.

Poland protested German military occupation of Slovakia.

Belgium and the Netherlands offered to mediate for France, Great Britain, Germany, Poland, and Italy; Germany expressed its "deep gratitude for this generous gesture" next day.

Supreme Soviet deferred ratification of non-aggression pact with Germany; reinforcements ordered for garrisons on western border.

Rationing of food and partial evacuation of larger cities ordered by Mussolini; Rome blacked out for first time in crisis.

Ivan Subovitch took office as first governor of autonomous Croatia.

Pres. Roosevelt repeated his belief that failure of Congress to modify U.S. Neutrality act encouraged Hitler to provoke war crisis.

Gen. Shunroko Hata named minister of war in new Japanese cabinet; Premier Abe took over portfolio of foreign affairs.

30 Another message to Hitler drafted by British cabinet and delivered shortly before midnight; British *White Paper* of September 1 revealed that note expressed willingness to initiate Polish-German discussions at earliest practicable date; in reply, German Foreign Minister von Ribbentrop read to Sir Nevile Henderson the text of 16-point proposal published in Berlin the next day; Chamberlain earlier had declared in telegram "it is . . . unreasonable to expect that we can produce a Polish representative in Berlin today."

Hitler established defence council of six headed by Goering.

Poland speeded up mobilization to include all qualified men between 21 and 40.

German military rule proclaimed in Slovakia by Premier Josef Tiso.

31 Sixteen-point "peace plan" published by Hitler suggested return of Danzig to Germany, retention of Gdynia by Poland, plebiscite in Polish Corridor to be held after a year, and extraterritorial communications zone through Corridor for whichever nation lost plebiscite; Polish Gov't, though it did not receive formal text, pronounced the terms of the proposal unacceptable.

British fleet, army, and air force placed on war footing; immediate evacuation of 3,000,000 persons from London announced; censorship of all messages ordered.

Soviet-German pact ratified by Supreme Soviet; Premier Molotov declared that proposed mutual assistance pact with Great Britain and France had been dropped because Britain had supported Poland's objections to Soviet troops on Polish soil, and had insisted on a clause covering indirect aggression.

Slovakia demanded that Poland return Teschen area occupied after Pact of Munich.

U.S. liner "America" launched at Newport News.

EUROPEAN WAR

SEPTEMBER

1 Germany began invasion of Poland at 5:45 A.M. on four fronts after proclamation to army by Hitler; German planes raided Warsaw and other Polish cities.

British-French ultimatums to Germany demanded suspension of aggressive action in Poland and withdrawal of all forces; France decreed general mobilization and martial law.

Hitler, in address to Reichstag, said Germany had "returned fire" because Poland had mobilized instead of sending emissary to discuss his proposals; declared he would wage humane war and not seek foreign help; named Goering as his successor and Rudolf Hess as next in line in case "something happens to me"; said the "Westwall is . . . for all times the Reich frontier in the west."

Danzig accepted as part of Reich after Albert Forster proclaimed its reunion with Germany.

Italian official communiqué stated "Italy will take no initiative whatever toward the military operations."

Chamberlain declared that "the responsibility for this terrible catastrophe lies on the shoulders of one man" and thanked Mussolini for his efforts to maintain peace.

2 Britain and France conferred upon expiration date for joint ultimatums to Germany; Chamberlain announced that Italy was striving to call a five-power conference.

Germany reported important advances in Polish Corridor and Upper Silesia; air raids on Warsaw and other cities continued.

French Chamber of Deputies voted Daladier authority to declare war and adopted war

budget of 69,000,000,000 francs; final mobilization began.

Germany, France, and Great Britain issued declarations of intent to refrain from inhumane warfare and attacks upon civilian populations.

Russian military mission arrived in Berlin.

Eire approved declaration of neutrality.

Ernest H. Gruening appointed governor of Alaska to succeed John W. Troy, resigned.

New perfusion pump to keep different types of animal tissue alive at same time announced by Col. Charles A. Lindbergh.

3 Great Britain declared war on Germany at 11 A.M. after setting time limit to ultimatum of September 1; France entered conflict officially six hours later.

British liner "Athenia," bound for Montreal with 1,418 aboard, "torpedoed" 200 miles west of the Hebrides; it sank next day; total loss of life was announced later, October 9, as 112, including 30 Americans.

Hitler left Berlin to join army on eastern front after issuing reply to British ultimatum in which he blamed British cabinet for outbreak of hostilities.

Winston Churchill entered British war cabinet as First Lord of the Admiralty; Anthony Eden was named secretary for the Dominions, without seat in cabinet, and Lord Hankey minister without portfolio; Viscount Gort appointed commander in chief of British field forces.

President Roosevelt declared in special broadcast that every effort of his administration would be directed toward maintaining true neutrality; he warned Americans against profiteering, urged them to discriminate between fact and rumour concerning the war, and pleaded for national unity.

British naval blockade of Germany in Baltic and North seas reported in Washington.

King George VI, in message broadcast throughout world, asked British subjects every-

where to "make our cause their own."

Australia and New Zealand announced state of war with Germany.

4 First French war communiqué announced that operations by land, sea, and air had begun against Germany.

British air force bombed German fleet at Wilhelmshaven and at western entrance to Kiel canal.

Loss of Bydgoszcz (Bromberg) and Grudziadz, strategic cities of Corridor, admitted by Polish general staff; Germany announced that northern Corridor was completely cut off.

Ronald Hibbert Cross appointed minister of economic warfare in Chamberlain's war ministry; Lord MacMillan became minister of information and William S. Morrison minister of food.

Gen. Franco decreed "the strictest neutrality on the part of Spanish subjects"; Yugoslavia, Bulgaria, and Rumania officially proclaimed their neutrality; statement of Japanese cabinet said nation "does not intend to be involved in it."

Popolo d'Italia reaffirmed Italy's intention to remain neutral unless attacked; resumption of semi-normal shipping schedules announced.

British ministry of information announced that Royal Air Force planes had scattered 6,000,000 leaflets over North-western Germany, protesting friendship for German people and urging them to place no confidence in Hitler; similar "raids" were repeated in following weeks.

U.S. State Dep't announced it would issue American passports for travel abroad only in cases of "imperative necessity."

Australian tennis team won Davis cup from U.S.A., 3 to 2, at Haverford, Pa.

5 Neutrality of U.S.A. proclaimed in two declarations: First was issued in accordance with international law; second was issued under terms of Neutrality act of 1937 and prohibited

export or transshipment to belligerents of arms, munitions, vessels, aircraft and aircraft parts, explosives, and chemicals for chemical warfare; other proclamations regulated use of Panama Canal by belligerents and travel abroad by Americans.

Removal of Polish capital from Warsaw to Lublin reported as German troops intensified drive on four fronts and announced virtual control of Upper Silesia.

French army came "in contact" with Germans along western front, according to communiqué of general staff.

Prime Minister Hertzog of South Africa resigned after parliament voted to sever diplomatic relations with Germany, 80 to 66.

Stocks rose 1 to 27 points in heavy trade on New York Stock exchange.

Earl Browder was said to have admitted before Dies Committee using false American passport; he declared a group of "wealthy Republicans" had offered U.S. Communist party \$250,000 in 1936 to nominate Roosevelt on its ticket.

Berlin's war ministry denied that German submarine had torpedoed "Athenia."

France and Poland signed protocol to treaty of alliance which prohibited either from signing separate armistice or treaty of peace.

Col. Roscoe Turner won Thompson Trophy air race at Cleveland for third time; his average speed was 282.53 m.p.h.

6 Cracow occupied by Germans, who also announced capture of Kielce; Poland admitted German advance from north as far as Plonsk.

French troops advanced into western Germany at several points, according to army communiqué which also announced debarkation of British troops in France.

Union of South Africa declared war against Germany; Gen. Jan Christiaan Smuts formed war cabinet.

SEPTEMBER—Continued

Eduard Benes and other former Czech leaders offered to form Czech legion to fight for Allies.

Great Britain suspended London naval treaty of 1936 and separate naval treaties with Poland and U.S.S.R.

American naval patrols established in Atlantic and Caribbean, to survey movements of belligerent fleets.

Liner "Bremen" reported by Berlin safe in unidentified neutral port, later revealed as Murmansk, U.S.S.R.

Iraq requested German minister to leave Baghdad.

7 Polish garrison of 77 men at Westerplatte fortress in Danzig harbour surrendered after six-day siege; German army continued "pincer" drives toward Lodz, Poznan, and suburbs of Warsaw.

German reinforcements for Westwall announced in Paris.

Egypt officially notified Great Britain it had severed diplomatic relations with Germany.

8 German army advanced to outskirts of Warsaw; high command falsely reported partial occupation of city; Poles claimed Germans had stolen wave-length of Warsaw radio station to announce capture.

Limited national emergency declared by Pres. Roosevelt, who ordered increases in enlisted strength of all U.S. armed forces.

Contraband bases for search of vessels established by Great Britain at Gibraltar, Kirkwall in the Orkneys, Weymouth, North Foreland, and Haifa.

Report of U.S. naval attachés said "Athenia" was torpedoed.

9 Field Marshal Goering declared in Berlin speech that Germany wanted nothing from France and accused England of scheming to "fight till the last Frenchman"; he implied Germany would like peace, but "not another Versailles."

Fall of Lodz announced by Germans, who began encirclement of Warsaw.

British war cabinet decided to make military and economic preparations for war of at least three years.

French occupation of most of Warndt forest, near Forbach, announced in Paris.

Reinstatement of independent Czech republic identified by Chamberlain with aims of war against Germany.

Immediate reorganization of executive offices ordered by Pres. Roosevelt "in order that the nation may not again be caught unaware."

10 Repulse of attack on Warsaw attributed by Germans to civilian sniping; German high command announced that two Polish armies had been trapped in pocket west of Warsaw, and near Radom; removal of Polish capital from Lublin to Lwow reported.

Germans launched counter-attack at extreme northern end of western front, where Berlin admitted for first time that French had crossed border.

Canada formally declared war against Germany.

Russia disclosed officially that it had called up reservists.

11 Poles and Germans met in fierce battles in Poznan and Lodz regions, at Warsaw, and along 250-mi. front from East Prussia to Slovakian border; Germans extended southern salient toward Lwow (Lemberg).

German counterattack checked at northern sector of western front; French reported advances north-east of Bitche.

Quotas on sugar suspended by Roosevelt to curb sharp rises in price.

Canadian parliament voted to appropriate initial war fund of \$100,000,000 and defeated motion to prohibit expeditionary force to Europe.

"There can be no lasting peace until Naziism . . . is banished from the earth," said Anthony Eden in international broadcast.

Counter-blockade against Great Britain announced in Berlin.

12 Chamberlain flew to undisclosed town in northern France to attend first meeting of Allies' Supreme War Council, which agreed "to give all possible assistance to their Polish ally."

Virtual encirclement of Warsaw reported by Germans after they had severed Warsaw-Bialystok railroad; fall of Poznan announced; drive toward Lwow continued.

Duke and Duchess of Windsor's return to England, after

three-year exile, announced in London.

Gen. Umez, new commander-in-chief of Japanese forces in Manchoukuo, said Japan desired "regulation of relations with the Soviets"; Gen. Juzo Nishio appointed commander of all Japanese armies in China.

Canadian declaration of war did not affect U.S. pledge to help Dominion if it was invaded, said Pres. Roosevelt.

13 Daladier took over foreign ministry in modification of French cabinet, transferred Georges Bonnet to ministry of justice, and created new ministry of armaments headed by Raoul Dautry.

Bombing of open cities threatened by German supreme command unless Poles ceased civilian warfare; U.S. Ambassador Anthony Biddle, Jr., declared in report to State Dep't that Germans had already conducted such raids.

U.S. Congress summoned by Pres. Roosevelt to meet in special session September 21 to consider revision of Neutrality act.

Chamberlain declared in House of Commons that France was "no less convinced than are we that there can be no peace unless the menace of Hitlerism has been finally removed."

German troops pushed toward outskirts of Lwow and extended drive from East Prussia toward Brest-Litovsk.

U.S. submarine "Squalus," sunk off Atlantic coast since May 23, towed to navy yard at Portsmouth, New Hampshire; 25 of its 26 dead were removed in next two days.

14 Gdynia surrendered after two-week siege; encirclement of Warsaw reported complete; removal of Polish capital to Zaleszczyki, on Rumanian frontier, announced in Berlin.

Repeal of arms embargo in U.S. Neutrality act would constitute intervention in European war, said Sen. William E. Borah (Idaho, R.) in radio broadcast.

U.S.A. warned all belligerents not to violate its rights as a neutral.

Pope Pius XII urged all belligerents to spare non-combatant citizens.

Hungarian Foreign Minister Csaky affirmed nation's intent to remain neutral.

15 U.S.S.R. and Japan agreed upon truce, effective September 16, to end hostilities on Manchoukuoan and Mongolian frontiers.

Germans advanced to outer fortifications of Brest-Litovsk and continued drives east of San river; Poles claimed large numbers of troops had escaped from pocket around Kutno and rushed to defence of Warsaw; party of 60 diplomats and members of their staffs fled from Poland to Cernauti, Rumania.

Australian Prime Minister R. G. Menzies formed war cabinet of six members and announced new taxes to meet costs of war.

Col. Charles A. Lindbergh, in first formal speech since 1931, broadcast appeal to Americans not to become involved in war.

Loring Christie appointed Canadian ambassador to U.S.A.

Strike of seamen in New York city prevented sailings of American liners bound for Europe.

16 German high command issued ultimatums that Warsaw either surrender or evacuate its civilians; or otherwise suffer unrestricted bombardment; the command was unanswered; fall of Bialystok and Kutno announced in Berlin.

Convoy system for merchant shipping announced by British Admiralty; unofficial statistics for first two weeks of war placed British losses at 21 ships of 123,000 tons.

"Great activity" in Saar region and strong German reinforcements announced by French army headquarters.

German official statement accused Great Britain and Poland of violating principles of humane warfare and threatened to retaliate against British blockade.

Resumption of general Japanese offensive in central China reported by Domei, Japanese news agency.

17 Soviet troops invaded eastern Poland along length of frontier after notifying Poland and assuring all powers with whom it maintained diplomatic relations that it nevertheless intended to pursue a policy of neutrality; Premier and Foreign Minister Molotov explained invasion was necessary because Poland had "suffered bankruptcy" and Russia was obliged to protect its "brother Ukrainians and brother Byelo-Russians."

SEPTEMBER—Continued

British aircraft carrier "Courageous" sunk by German submarine; announcement was delayed until next day; official list of casualties on September 20 placed dead and missing at 515.

Capture of Brest-Litovsk announced after severe battle; thousands of Polish troops and refugees fled across Rumanian border.

Bobby Riggs and Alice Marble won U.S. singles tennis championships.

Pres. Moscicki signed proclamation that Polish Gov't would function "with full authority" in foreign country.

18 Russian and German forces met at Brest-Litovsk, according to Berlin report; joint commission met to set up limits of occupation for each army; attack on Warsaw resumed; Germans announced capture of rich oil regions of Ukraine, where Russia also advanced westward to Stanislawow.

Polish Gov't fled country; Pres. Moscicki, Foreign Minister Beck, and Marshal Smigly-Rydz arrived at Cernauti, Rumania.

Alfred M. Landon and Frank Knox, titular leaders of Republican party, invited by Pres. Roosevelt to confer with him September 20 before special session of Congress.

British ministry of information declared Russian invasion of Poland was "not justified by the arguments put forward by the Soviet Gov't"; the Vatican's *Osservatore Romano* denounced Russian action as based on a "pretext . . . that was not courageous."

Premiers and foreign ministers of Denmark, Finland, Norway, and Sweden met at Copenhagen to outline program of neutrality; these nations and Iceland issued a joint declaration next day that they would cooperate intimately to preserve their peace and protect their own economic interests.

19 Hitler at Danzig repeated he had no claims against France and Great Britain, but declared Germany and Russia had agreed that "Poland will never rise again in the form of the Versailles treaty"; he said Germany would fight for seven years if necessary, and threatened to retaliate against British blockade by using "a weapon with which we cannot be attacked."

Official French reply to Hitler's Danzig speech called address a "sad plea . . . blustering . . . and lying"; official British reply called it "full of crass misstatements."

Russian troops occupied Vilna and continued advances in White Russia and Ukraine; blockade of Estonian coast by Soviet navy reported after Polish submarine had escaped from internment at Tallinn harbour; Germans issued ultimatum for surrender of Lwow.

Massing of German troops at Aachen on Belgian border reported in Paris.

20 Complete elimination of Poznan-Kutno pocket after furious nine-day battle announced by German high command; Berlin also announced arrival of Gen. von Brauchitsch, commander-in-chief of army, at western front and transfer of many divisions from Poland to Westwall.

Widespread revolt of Czechs in Bohemia and Moravia, beginning September 17, reported by British ministry of information; Berlin denied it, as did Pres. Emil Hacha September 23.

Rumanian Gov't announced Marshal Smigly-Rydz would be interned for duration of European war.

Chamberlain, in weekly report before House of Commons, asserted Hitler's Danzig speech "did not change the situation"; he said Soviet invasion of Poland was not unexpected.

German military officers arrived in Moscow to decide upon method of partitioning Poland.

Joe Louis knocked out Bob Pastor in 11th round of heavy-weight championship bout at Detroit.

21 Repeal of U.S. arms embargo asked by Pres. Roosevelt in message to special session of Congress; he said he regretted having signed Neutrality act of 1937 and declared if the embargo were annulled "the United States will more probably remain at peace than if the law remains as it stands."

Premier Armand Calinescu of Rumania assassinated by members of pro-Nazi Iron Guard in Bucharest; assassins were executed on the spot, and new temporary cabinet of Gen. George Argesanu ordered execution or imprisonment of hundreds of other Iron Guardists during next two days.

Blue Book of secret diplomatic messages between British diplomats and Foreign Office from March to Sept. 1939 published in London.

Dr. Joseph Goebbels denied that Germany had any intention of violating neutrality of Belgium, the Netherlands, or Luxembourg.

Premier Daladier charged Germany and Russia had signed secret pact Aug. 23, 1939 to partition Poland.

Russian troops announced occupation of Lwow after withdrawal of German besiegers, but Germany claimed capture of city September 22.

22 Nazi-Soviet agreement on military demarcation of Poland announced in Berlin; line ran from East Prussian border south along Pissa, Narew, Bug, Vistula, and San rivers.

Frontier areas reported partially flooded by Belgium and the Netherlands as experimental precaution against German invasion.

All elections in Great Britain suspended for duration of war.

Two submarines of undisclosed nationality had been sighted off North American coasts, said Pres. Roosevelt.

Allies' Supreme War Council held second meeting in England.

Wholesale arrests of Ukrainian landlords announced in Moscow.

23 Conquest of Poland completed, declared German high command; Poles continued organized resistance at Warsaw and Modlin, and on Hela peninsula; German troops began withdrawal behind military line of demarcation.

Mussolini reaffirmed Italy's neutrality, in his first speech since May 20; he said that since the Allies had not declared war on Russia they should also face "the German fait accompli" in Poland.

Pan-American conference on neutrality convened at Panama city; Pres. Arosemena of Panama urged solidarity of American democracies in safeguarding peace.

Recapture of Kaoan claimed by Chinese.

Alfred M. Landon urged Pres. Roosevelt to disclaim intention of running for third term.

War appropriations up to 15,-000,000,000 marks decreed by German defence council.

Hungary resumed diplomatic relations with U.S.S.R., ruptured since February 2.

Adm. Kichisaburo Nomura appointed Japanese foreign minister.

24 Heavy artillery of French and Germans opened fire for first time along 80-mi. Rhine front from Lauterbourg to Swiss border.

Neva river reported closed to foreign shipping by U.S.S.R.

Half of Warsaw in flames and 1,000 civilians killed after intense 24-hour bombardment, according to Polish dispatches.

Major Japanese offensive in Kiang-si and Hunan provinces along 70-mi. front announced in Tokyo.

25 French planes raided Zeppelin factory at Friedrichshafen; heavy bombardment of German fortifications along Rhine and in Saar sector continued.

Soviet troops concentrated on Estonian border as Foreign Minister Karl Selter returned to Tallinn after hurried conference in Moscow.

21st American Legion convention opened in Chicago.

26 British fleet attacked by Nazi planes in North sea; Berlin claimed that "Ark Royal," aircraft carrier, had been "destroyed," but London denied that any ship had been hit.

French communist party dissolved by decree of cabinet.

Removal of all known communists from U.S. governmental positions had been ordered by administration, according to Rep. Martin Dies (Dem., Tex.).

Destruction of "perhaps a third" of Germany's active submarines announced by Winston Churchill; he said more than 2,000,000 tons of German shipping were sheltered in Reich or interned in neutral harbours.

Hitler returned to Berlin after 23-day absence on Eastern front.

Disbandment of War Resources Board announced by Pres. Roosevelt.

27 Warsaw surrendered unconditionally after 20 days of siege; German troops began occupation of city October 1.

Basic rate of British income tax raised to 37.5%—highest in history—for 1940-41 fiscal year, to meet £2,000,000,000 war budget.

SEPTEMBER—Continued

German Foreign Minister von Ribbentrop and Estonian Foreign Minister Selter arrived in Moscow for conferences with Soviet Gov't; Turkish Foreign Minister Shukru Saracoglu continued talks with V. Molotov.

Col. Gen. Gerd von Rundstedt named military administrator of German occupation in Poland; Hans Frank appointed civil administrator.

28 Constantine Argetoianu appointed Rumanian premier to succeed Gen. Argesanu, temporary head of Gov't since assassination of Premier Calinescu September 21.

Polish fortress at Modlin, near Warsaw, surrendered unconditionally.

Foreign relations committee of U.S. Senate voted approval of Pittman resolution to repeal arms embargo, 16 to 7.

Independence of India at end of European war demanded by Gandhi.

Raymond J. Kelly of Detroit elected national commander of American Legion.

Acceptance of Lhamo Dhondup, five-year-old Chinese boy, as 14th Dalai Lama of Tibet after meeting of secret council in Lhasa. Boy later named Linergh Tanchu.

29 Russo-German frontier agreement signed in Moscow; protocol statement declared both nations would try to persuade England and France to make peace with Germany, but would consult on "necessary measures" if Allies refused; agreement established new border as beginning at southern tip of Lithuania, running westward north of Augustow to East Prussian frontier, along Pissa river to Ostroleka, south-east to Bug river, along Bug to Krystynopol, then westward to San river and along San to its head.

Estonia concluded treaty of "mutual assistance" with U.S.S.R. which permitted Soviets to establish naval and air bases on Dagoe (Hiu Maa) and Oesel (Saare Maa) islands and at port of Paldiski, also to maintain troops on Estonian soil; pact was ratified at Tallinn October 4.

William Z. Foster, chairman of U.S. communist party, declared party would not support U.S.A. if it entered war on side of Allies.

Dissolved communist party of France reorganized and adopted new name—French Workers and Peasants group.

Philippine National Assembly declined to modify stand for independence from U.S.A. in 1945.

30 Ignace Moscicki resigned as president of Poland in favour of Wladislaw Raczkiwicz; Gen. Wladislaw Sikorski named premier of Gov't, resident in France.

Armed British merchantmen would be treated as warships and torpedoed without warning, declared Berlin.

Permanent Pan-American advisory committee of 21 established at Panama city, to sit in Washington for duration of war.

OCTOBER

1 Winston Churchill condemned Russia's actions in Poland and Baltic states as necessary to its "national interest"; he praised the "great and friendly nation of Italy," declared menace of German U-boats was throttled, and said it would not be for Hitler to determine when war should end.

Conscription of 250,000 new troops between 21 and 22 ordered by British royal proclamation.

Italian Foreign Minister Ciano arrived in Berlin for conference with Hitler and von Ribbentrop; he returned to Rome next day.

Last regular centre of Polish military resistance disappeared with surrender of troops on Hela peninsula.

Chinese troops captured Japanese positions along Hongkong border in surprise attack.

2 Debate on U.S. Neutrality act began in Senate; Sen. Key Pittman (Nev., D.) presented administration's arguments for revision and Sen. William E. Borah (Idaho, R.) summarized views of opponents to repeal of arms embargo.

U.S.A. would withhold recognition of Polish conquest and continue relations with new Polish Gov't in France, declared Sec'y of State Hull.

Safety zone with average width of 300 mi. around all coasts of Western hemisphere except those of Canada and European possessions proclaimed by 21 republics in Declaration of Panama.

Vilhelms Munters, foreign minister of Latvia, arrived in Moscow for conference with Molotov.

U.S. merchant vessels must submit to halt and search, Berlin notified Washington.

3 David Lloyd George counselled the House of Commons "not to be in a hurry" to reject German peace proposals; Chamberlain declared that Soviet-German threats left England unmoved.

Lithuanian Foreign Minister Juozas Urbysys joined diplomatic trek to Moscow.

Conference of 21 American republics closed at Panama city.

Japanese War office admitted casualties of 18,000 killed, wounded and sick during border conflicts with Russia between May 11 and September 16.

23 Roosevelt named Myron C. Taylor his personal representative at Vatican with rank of ambassador without portfolio; President also asked Pope Pius XII and U.S. Jewish and Protestant leaders to work for world peace.

All American republics protested jointly to France, Great Britain, and Germany against violation of 300-mi. "safety zone" around hemisphere.

24 Five-point peace plan of Pope Pius XII called for guarantee of all nations' independence, disarmament, return to international morality, and meeting of "just demands of nations and . . . minorities."

Irish Republican Army members raided magazine of Dublin fort.

25 Finnish troops crossed Russian border for first time in drive to sever Murmansk railway; Viipuri suffered heavy long-range artillery bombardment.

26 British announced new mine field along length of eastern coast approximately 30-40 mi. wide.

27 Sweden and Great Britain concluded wartime trade pact.

28 Pope Pius XII paid formal visit to King Victor Emmanuel.

30 Charles Edison appointed U.S. Sec'y of Navy.

Finns routed Russians in two-day battle north of Lake Kianta; entire Russian division reported annihilated.

31 Disputes over fishing grounds and Manchoukuoan railroad settled by two Russo-Japanese pacts.

Total German and Allied casualties of war estimated by French at 9,604. (Jan. 1, 1940).

Abbott, Grace

(1878-1939), American social worker, was born November 17 at Grand Island, Neb., and graduated from the college there in 1898. For several years she taught in the high school at Grand Island, then moved to Chicago where she became associated with the late Jane Addams as a resident at the Hull House. This experience crystallized her determination to enter social work, and to devote her career especially to the problems of children. President Wilson appointed her director of the child labour division of the U.S. Children's Bureau in Washington in 1917, and from 1921 to 1934 she was chief of the bureau. In this position she exerted a powerful influence on public opinion in favour of the child labour amendment and other social legislation. Her articles on the training of children, published in the bulletins of the Children's Bureau and in current periodicals, attracted millions of readers. In 1934 she became professor of public welfare at the University of Chicago. Several months before her death in Chicago on June 19 she completed her two-volume *The Child and the State*. See also *Encyclopædia Britannica*, vol. 1, p. 22.

Abe, Nobuyuki

(1875-), Japanese prime minister, was born in Nov. 1875 at Ishikawa-ken and graduated from the Military Officer's school in 1897. He entered military service and became successively an instructor of military tactics at the Military academy, military attaché to Austria, director of the national bureau of military affairs, chief secretary of the Japanese Military council, army vice-minister, and acting army minister. In 1932 he was appointed commander of the Taiwan army. Though he possesses perhaps an unrivalled knowledge of Japanese military affairs, he had never held a high political office when the emperor commanded him to form a cabinet Aug. 28, 1939, after the resignation of Prime Minister Kiichiro

Hiranuma (*q.v.*) had been precipitated by announcement of the Soviet-German pact of non-aggression. Abe completed his cabinet the next day and retained for himself temporarily the portfolio of foreign affairs. Almost the first action of the new cabinet was the issuance of a statement that Japan "does not intend to become involved" in the European war. Abe also indicated that his Government would pursue the Chinese "incident" to its conclusion, and would adopt a foreign policy of rigid independence. He resigned Jan. 14, 1940.

Aberdeen and Temair, Ishbel Maria, DOWAGER MARCHIONESS

OF (1857-1939) was the widow of the first Marquess of Aberdeen and Temair, Governor General of Canada and twice Lord Lieutenant of Ireland, who died in 1934. With her husband she was an influential leader of English liberalism during the ministries of Gladstone and afterward. In her earlier years she was a prominent suffragist and participated frequently in Scottish political campaigns. Later she became internationally known for her philanthropic activities. When her husband became Lord Lieutenant of Ireland in 1886 she became president of the Women's National Health association, which established tuberculosis sanatoria throughout Ireland. When he was appointed Governor General of Canada she established the Victorian Order of Nurses there. For 38 years she was president of the International Council of Women. She wrote a joint autobiography with her husband, *We Two* (1925) which was widely read in Great Britain and the United States. Other volumes were *More Cracks with We Two* (1929) and *The Musings of a Scottish Granny* (1936). She died at Rubislaw, Aberdeenshire, Scotland, on April 18.

Abyssinia: see ITALIAN COLONIAL EMPIRE.

Academic Freedom.

The major scholarly associations in the United States of a general character have established academic freedom committees. This list, Jan. 1, 1940, included the American Association of University Professors, the American Federation of Teachers, the National Educational Association, and the Progressive Education Association. On Jan. 11, 1940, the Association of American Colleges at its annual meeting adopted in amended form a statement of principles concerning academic freedom and tenure which had been drafted by a joint conference of committees of the American Association of University Professors and the Association of American Colleges. Although this statement as amended represents a genuine advance over previous formulations, it remains to be seen whether the American Association of University Professors will be satisfied with the changes made by the college presidents. The "full freedom" of the teacher "in research and in the publication of results, subject to the adequate performance of his other academic duties," is recognized. Both groups, moreover, agree that the teacher should have freedom in discussing his subject in the classroom and that "when he speaks or writes as a citizen he should be free from institutional censorship or discipline." The American Association of University Professors has wished, however, the acceptance of the specific probationary periods outlined by the joint committee. Under this plan an instructor or a person of higher rank would normally receive permanent tenure after serving a maximum of six years. Beyond this period, the termination of appointments would be for "adequate cause" or for extraordinary and proven financial exigencies. Dismissal would be only after a hearing at which the teacher is afforded an adequate opportunity to defend himself.

The Association of American Colleges voted to leave it to each college to define "with great care" the probationary period, although it accepted the right of an aggrieved teacher to an adequate hearing. Another disagreement has been over the refusal of the Association of American Colleges to favour the provision that the individual teacher should be the sole judge of whether he had, outside of the classroom, used "appropriate restraint" in his utterances.

The American Association of University Professors reported in 1939, 104 cases of alleged violation of academic freedom. Outstanding 1939 cases in which infringements to academic freedom or tenure were found include those at the University of Tennessee, John B. Stetson university, St. Louis university, Montana State university, and West Chester State Teachers college. The administrations of all these institutions were placed on the censured list of the American Association of University Professors. The State Board of Higher Education of North Dakota was removed from the Association's censured list after that board had reinstated faculty members of the North Dakota Agricultural college.

Adams, John Taylor

(1862–1939), U.S. political leader, was born at Dubuque, Ia., on December 22 and entered a manufacturing business in 1881. His

political career started in 1908, when he managed a senatorial campaign; four years later he managed William Howard Taft's campaign in Iowa, and from 1912 to 1924 he was a member of the Republican National Committee for Iowa. From June 1921 to June 1924 he was chairman of the Republican National Committee. He died at Dubuque on October 28.

Aden. Aden Colony, including Perim island, etc., area 80 sq.mi.; pop. (1931) 46,638. Aden Protectorate, including Sokotra, area 112,200 sq.mi.; population (estimated) 600,000. Governor, Lt.-Col. Sir Bernard Rawdon Reilly, K.C.M.G., C.I.E., O.B.E.; language: English and Arabic; religion: Mohammedan.

History.—Although Aden is the youngest crown colony (1937) it has been a British possession since Jan. 19, 1839. The centenary was celebrated. In the Protectorate the rule of law and economic order extended steadily, especially in the territories of the Qua'iti and Kathiri Sultans. For his services in the promotion of peace and the improvement of transport, irrigation and education in the Hadrahmaut the Seiyid Bubakr was made Commander of the Order of the British Empire. The outbreak of war found the various rulers of the Protectorate in full sympathy with the Allied cause. The importance of Aden itself, as a naval and military and to some extent an air base, is likely to be accentuated.

Production 1938-39: tobacco (approx. value of crop) Rs. 500,000; salt 262,994 tons; (export) 248,784 tons. External trade 1938 (merchandise and treasure on private account): imports, by sea Rs.6,78,60,400; by land Rs.29,40,602; exports, by sea Rs.3,41,45,281; by land Rs.15,95,929; treasure: imports Rs.1,23,69,439; exports Rs.72,50,784.

Finance 1938-39: revenue £148,586; expenditure £127,963; currency, legal tender: rupee (Rs.1)=1s.6d.

Communication: shipping (1938), 2,079 merchant vessels entered; total tonnage 8,650,411 net tons; motor vehicles registered (Sept. 30, 1939) 733 cars and taxis, 207 commercial vehicles.

Adjusted Compensation. On May 19, 1924, the World War Adjusted Compensation Act was passed by the Congress of the United States providing for the adjustment of the pay of veterans of the World War. In substance it bestowed basic service credit of \$1.00 for each day's service in the United States and \$1.25 for each day's service overseas, with deduction on account of the \$60 bonus previously authorized and limited to a maximum of \$500 for home service and \$625 for overseas service. If service credits amounted to no more than \$50, veterans were paid in cash, payments numbering 176,872 and aggregating \$5,537,821.91 having been paid under this provision of the statute.

In the case of deceased veterans, service credits were payable to their dependents and such payments amounting to \$48,448,582.53 have been made on 146,825 veterans' cases. To living veterans whose service credits exceeded \$50 there have been issued 3,789,783 adjusted service certificates, the face values of which total \$3,708,546,587.00.

These certificates having loan privileges are, in essence, paid-up 20-year endowment insurance policies, the maturity values thereof approximating two and one-half times the service credit. A sum of \$237,596,330.59 has been paid on 240,864 certificates because of maturity having been occasioned by the deaths of veterans.

Legislation enacted Jan. 27, 1936 made the face values of adjusted service certificates, less any outstanding loans and interest accrued prior to Oct. 1, 1931, payable as of June 15, 1936, upon application. The face values of the 3,494,607 adjusted service certificates upon which certifications have been made totalled \$3,424,119,301.00, and the amount certified as payable after deducting outstanding liens was \$1,911,587,215.59.

Payment was prescribed by the law to be made by the issuance of bonds of the United States in denominations of \$50, odd amounts in excess of any multiples of \$50 to be paid by checks. These bonds are dated June 15, 1936 and mature on June 15, 1945, but are redeemable at the option of the veteran at any time, interest accruing at the rate of 3 per centum per annum except no interest accrued on bonds redeemed prior to June 15, 1937. In settlement the Treasury Department has issued to veterans bonds totalling \$1,828,653,700.00 and has redeemed \$1,545,759,050.00 of these bonds. The Adjusted Compensation work has to a large extent been completed, certification having been made on all certificates issued up to this time with the exception of 54,312 for which applications for settlement have not been received from veterans. All data herein cited are as of June 30, 1939. (See also VETERANS' ADMINISTRATION.) (F. T. H.)

Advertising. Outstanding developments in the United States during 1939 include increasing use of photographs, more coloured advertisements in newspapers, enforcement of the Wheeler-Lea Act and the Food, Drug and Cosmetic Act, which have brought about drastic changes in advertising copy.

In the United States, network radio advertising increased about 17% over 1938. Newspaper lineage increased about 2%, magazine 2.6%, farm paper decreased 1.5%, while outdoor advertising held its own. For these five media combined, the net result was an increase in advertising volume of about 2.5%. These estimates are based upon a study made for the publication, *Printers' Ink*.

British advertising expenditures dropped sharply during 1939. In London morning newspapers the decrease was 15.9%; in London evening newspapers, 16.6%; in national Sunday papers, 15.2%; in provincial daily papers, 17.9%; in provincial and suburban weekly papers, 15.7%; in magazines, 7.09%; in technical journals, 13.7%; and in trade journals, 16.7%. These figures were prepared by the Legion Publishing Company, Limited.

Copy and Layout.—In the United States, copy tended to become more specific and realistic. It demonstrated more sparkle, a swifter pace and more dramatic quality. The question and answer technique, originally introduced in radio advertising, was transferred to printed advertising. In layout, the trend toward photograph and caption developed to a point where it was common to find several photographs in an advertisement, where formerly one or two were considered adequate. Photography largely replaced line drawings and special advertisements were devised for adaptation to the characteristics of various media. In spite of the European war, humour persisted to a marked degree in British advertising. Photographs were used increasingly for illustrations, the trend being away from line or wash drawings. In general, British advertising came to follow more closely American technique.

Advertising Media.—Rotogravure advertising in the United States increased 7.8% in 1939. Although no accurate figures are available, it is estimated that spot radio broadcasting increased 25% over 1938. There was a reduction in the number of Hollywood-produced shows and a tendency to cut talent costs. (See also RADIO, INDUSTRIAL ASPECTS OF.)

On April 30, 1939, television was publicly introduced by NBC. In November, the Federal Communications Commission Television Committee advised caution in commercializing television, but

How to find a button in a baby...

THIS PRIZE-WINNING U.S. ADVERTISEMENT of the 1938 Annual Advertising Awards, announced in Feb. 1939, stresses "institutional" copy

made it clear that the FCC encourages its development beyond the experimental stage. However, television will not become an advertising medium until enough receivers are in use to make adequate audiences available.

British advertising has been greatly influenced by an important increase in film advertising—5-minute shorts. Theatres were eager to get these commercial films because they revived audiences which had fallen off to a large extent. It is estimated that one of the commercial films shown in 1,500 theatres reaches a total audience of 13,000,000 persons per week.

Two principal radio stations on the Continent were broadcasting commercial radio programs for British manufacturers. These were Radio Normandy and Radio Luxembourg. With the actual declaration of war both stations ceased to accept commercial programs. Toward the end of the year only Radio Normandy had resumed commercials, but would allow only identification on the part of the advertiser without any actual commercial advertising.

Newspapers.—There was an increasing willingness on the part of newspaper representatives to discuss wide differentials between local and national newspaper rates. (See also NEWSPAPERS.)

Outdoor Advertising.—It became possible, for the first time, to buy outdoor space in nine different "intensities," or degrees of coverage. Formerly, there were only three. This made outdoor advertising more flexible. Another new factor was guaranteeing a minimum circulation, based on traffic counts.

Statistics on the circulation of outdoor advertising now cover 65% of all advertising space in 17,000 communities.

Legislation.—In the United States, application of existing laws caused more immediate apprehension among national advertisers than new measures added to Federal statute books in 1939. The Wheeler-Lea amendment to the Federal Trade Commission Act, and the Food, Drug and Cosmetic Act brought about drastic curtailments in copy, and the wide discretion vested in both the Federal Trade Commission and the Food and Drug Administration was the element which advertisers found most troublesome.

NEWSPAPER ADVERTISING (total lineage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

An amendment was passed to the Food, Drug and Cosmetic Act making mandatory a six months' extension of labelling provisions, to afford manufacturers ample time to comply with the law. The Federal Trade Commission announced that, thereafter, agencies would be held jointly liable with clients in cases involving alleged false or misleading copy.

From an advertising standpoint, the charge by the Federal Trade Commission that the use of the Good Housekeeping "Seal of Approval" violated Federal legislation was one of the most interesting legal actions introduced during 1939. The case was described as one of the most important legal battles in the history of advertising.

British advertising was affected, in some lines, by legislation enacted as a result of the war. Producers of gasoline, tea, and margarine were forced to pool their products, with the result that brand names could not be used and advertising was ineffective. Later in the year, this restriction was removed in the case of margarine and the British Government retained the right to apply such legislation to other products.

Research.—As in previous years, activities in advertising research carried on by specialized organizations, publications, and advertisers in the United States, continued to increase. A joint study was continued by the Bureau of Advertising of the American Newspaper Publishers Association and the Advertising Research Foundation to determine current newspaper reader habits.

Qualitative measurements of the effect of radio programs upon audiences were improved and figures on radio ownership, listening habits, and location of receiving sets were made available to advertisers and advertising agencies.

Late in September, the results of a four-year copy-testing study were issued in book-form by the Advertising Research Foundation.

Co-operative Advertising in the United States showed a marked increase, both as to scope and expenditure. Many new groups joined co-operative movements for the first time. Among the outstanding co-operative campaigns in 1939 was the "Parade of Progress," sponsored by the Associated Grocery Manufacturers of America. State, county, and community advertising increased sharply to promote tourist, vacation, and World's Fair trade. British co-operative advertising was extensively developed, especially in several of the dominions, where campaigns were instituted for agricultural products, salmon, fruit, butter, and cheese.

Consumers.—In the United States, the consumer movement developed to such proportions, in 1939, that no manufacturer could afford to ignore its influence. Consumer pressure caused greatly increased consumer activities among Government agencies. Advertisers tended, more and more, to tell their side of the "consumer movement" story.

Regulation and Ethics.—In the United States, the National Association of Better Business Bureaus issued a Fair Trade Code containing 10 injunctions, in addition to publishing the first edition of "A Guide to Better Advertising," a loose-leaf form designed for continuous service. The National Association of Independent Tire Dealers asked the National Bureau of Standards, U.S. Department of Commerce, to establish protective standards against misleading advertising. Liquor advertising was carefully scrutinized by the Temporary National Economics Committee (T.N.E.C.). Advertisers were requested to submit figures for expenditures in various media, while the Federal Alcohol Administration requested similar information from State control agencies. The Federal Communications Commission ruled that any radio program is an advertising program when it is announced that such program is sponsored, even though no actual advertising be included in the program. Numerous groups and associations, including the American Medical Association, New York Stock Exchange, New York City Better Business Bureau, and Associated Business Papers, Inc., adopted or sponsored new codes of advertising ethics and regulation.

Contests and Premiums.—In the United States, these two advertising adjuncts became more popular than ever during 1939. On one major radio network, about 65% of the commercially-sponsored programs featured contests or premiums. It was estimated that premiums and contest prizes, exclusive of cash awards and the advertisers' own merchandise, had a total value of \$425,000,000 for the year.

War and Advertising.—In the United States, advertising was directly affected by the European war. War-inspired copy took three definite trends: first, copy explaining new conditions due to the war; second, copy that merely used war interest as a background for the main message; third, copy that promoted domestic products as readily available substitutes for imported goods. "See America First" took on new significance as the theme of transportation and resort advertising.

The great bulk of steamship advertising was withdrawn and a marked increase in American advertising to Latin American dealers was noted. In the United Kingdom, the war has brought a new copy appeal based on such themes as "nerves," "war nerves," "gas-proof," etc. The British Food Ministry appointed an agency to handle its advertising, while the Council of the Pharmaceutical Society of Great Britain presented a set of advertising regulations to companies subject to the Pharmacy Act. British business revived its interest in co-operative advertising. Newspapers were

Incendiary Bombs or other brilliant combustion.

GOGGLES FOR AIR RAIDS, advertised in 1939 for British readers

sharply reduced in size as a conservation measure, and *War Illustrated*, which appeared during the World War (1914-18), was revived. The Government's campaign to increase voluntary enrolment of men and women for civilian national service in air-raid precaution work was eminently successful. Generally, cancellation of advertising programs was widespread, while all gasoline was unbranded and sold under the name "petrol," thus eliminating any need for advertising individual brands. The British Government made wide use of military posters and newspaper advertisements, and films played an important part in the Government's propaganda activities. (See also *PSYCHOLOGY, APPLIED: Market Research and Advertising*; *RADIO, SCIENTIFIC DEVELOPMENTS OF.*)

Aeronautics: see AVIATION, CIVIL.

Afghanistan. Area 250,000 sq.mi.; pop. (est. 1937) 10,000,000; chief towns: Kabul (80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Muhammad Zahir Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

History.—A year of otherwise peaceful progress was broken by echoes of the trouble in Europe. The Government declared its neutrality, but was reported to have ordered a general mobilization and to be exercising special vigilance on the Russian frontier. On the eastern border, hostilities were opened, within a week after the German invasion of Poland, by a tribal gathering from Tirah; but this was repelled by joint action on the part of the Afghan and British authorities. In its attitude generally, Afghanistan was keeping touch with the other signatories of the Saadabad Pact of Friendship, viz., Turkey, Iraq, and Iran. (ME.)

Finance.—Revenue and expenditure about Rs. (Afghan) 150,000,000; currency: Rs. 3.95 (Afghan)=Rs. 1 (Indian). Rs. 1 (Afghan)=5d.

Trade and Communication.—(1938) Imports, Rs. (Indian) 23,532,212; exports, Rs. (Indian) 29,644,821. Persian lamb-skin is one of the most important exports. Other exports are carpets, fruit, wool, and cotton. Roads: trade routes, Kabul to Peshawar (India) 210mi., and Kandahar to Chaman, 70mi.; there are about 2,265mi. of unmetalled roads connecting the chief towns.

Agriculture.—Wheat, rice, millet, maize, sheep, Persian lamb-skin; wool (1936) 6,800 metric tons.

Agriculture. The United States farmers have had three good crop years, 1937, 1938, and 1939, and the nation has gradually restocked the supplies depleted by the severe droughts of 1934 and 1936. Prices, however, have not reacted favourably.

In the United States, the first two-thirds of the year 1939 was one of low and falling prices for farm products accompanied by high taxes and wages, and high prices for most goods and services purchased by farmers.

The low prices of farm products were due to (a) the combination of forces which caused gold to have a very high value, depressing all commodities, including farm products, and to (b) the abundance of nature which supplied good crops, tending to depress farm prices even more. In Aug. 1939, the index of United States farm prices was 88, when the five years 1910-14 was 100. Retail prices of food were much higher, 132; and the cost of living, 143. The purchasing power of farm prices in terms of the cost of living was 62%, of normal, compared with a recent high of 89 in April 1937 and a low of 42 in Feb. 1933.

The low purchasing power of farm products in recent years has resulted in the inauguration of many remedial measures to assist agriculture. They included acreage control, crop insurance, Government purchases of surplus crops, two price systems, tariffs, export bounties, trade agreements, direct cash payments, and the like. But these measures did not stem slowly falling prices.

With the outbreak of the European war, the direction of the movement of commodity prices was reversed. From August to September, prices rose from 15 to 25%. During October and November, there was some reaction to the rapid advance, but commodities generally continued well above the pre-war level.

Wars and Prices.—Most persons believe that wars induce advances in commodity prices. In reality, wars have been accompanied by all sorts of changes in commodity prices. During some wars, prices within the warring nations fell; during others, they rose; while during still others, they were unaffected. The problem is further complicated by the fact that some wars are accompanied by little or no change in prices in non-combatant countries;

whereas other wars are accompanied by price advances in neutral as well as combatant nations. The fact that during many wars some countries experience wild inflation adds to the confusion.

The experiences of the United States are a good illustration of the varied effects of war on prices. The Mexican War, 1846-47, and the Spanish American War, 1898, had little effect on prices in the United States (fig. 1). Prices rose 5% during the Mexican War, and fell 1% during the Spanish American War. On the other hand, the Revolutionary War, 1775-83, the War of 1812, 1812-15, the Civil War, 1861-65, and the World War, 1914-18, were accompanied by striking advances in commodity prices in the United States.

The advance in commodity prices during the Revolutionary War was due to the printing of paper money. The expression, "not worth a Continental," dates back to the excessive issue of the Continental notes of this period. This war did not disturb the price levels of non-combatants.

The 54% advance in prices during the War of 1812 was due to two forces: (1) a moderate depreciation of the paper money of this country, and (2) a world-wide rise in prices that accompanied the Napoleonic wars then in progress. Most of the rise in prices in the United States was due to the latter force which affected commodity prices in all countries.

The 131% advance in commodity prices in the United States during the Civil War was primarily due to the depreciation of the greenbacks in terms of gold. This war had little or no effect on prices of non-combatant countries, whose price levels advanced, on the average, only 7%.

The sharp advance in commodity prices in the United States during the World War (1914-18) was due to a world-wide rise in prices which affected all neutral gold-standard countries as well as the warring nations. Since the dollar did not depreciate in terms of gold, the advance in commodity prices was due to the world-wide forces that caused gold to lose value. This was the only major war involving the United States in which the currency did not depreciate.

Apparently, prices in a country can rise because of the forces

that cause the standards of value, gold or silver, to decline; or that cause the paper money of a country to decline relative to its standard. The Napoleonic wars and the World War (1914-18) are the only modern conflicts of sufficient magnitude to cause a world-wide depreciation of the metallic standards. The minor wars of the United States, England, France, and Germany were not of sufficient magnitude to cause world-wide advances in the prices of commodities. The many advances due to currency depreciation occurred during both major and minor conflicts, but usually affected only the country in question.

A prolonged European war would probably be accompanied by a rise in commodity prices due to forces that (a) cause a depreciation of the measure of value (gold) and (b) cause the depreciation of the paper currencies of some of the combatants. Since the United States has such huge stocks of gold, most of the changes in prices in this country will be due to forces causing a world-wide rise in commodity prices in terms of gold, rather than to a depreciation of the paper dollar. If the United States becomes involved in a prolonged conflict, conditions may eventually arise which would cause the dollar to depreciate.

Prices of Individual Commodities.—If a prolonged major war ensues, the United States price level will probably advance considerably above its present level. The time, the cause of the advance, and how far it will go are largely subjects for speculation. In general, prices of raw materials will rise more rapidly than retail prices, costs of living, wages, and salaries. Prices of specific war materials and certain types of agricultural products will advance more rapidly than the average of raw materials. Concentrated food products, like wheat, pork, and corn are likely to advance more rapidly than bulky, perishable products, like milk, potatoes, fruits, and vegetables.

Since there is so much uncertainty concerning the effect of wars on prices of individual commodities, the best method of procedure is to analyze their price movements during the World War (1914-18). Prices of beans advanced more rapidly and a greater amount than the average of all farm products. This may have been due to the fact that the United States is normally a net importer of beans.

The Ohio farm price of wool advanced more rapidly than the general level, and during 1917, 1918, and 1919, was very high compared with other products. Wool is a commodity in great demand in times of war, and normally the United States is an importer of this product.

In the year 1939 wool was the highest-priced farm product. The index of the October farm price of wool was 168, compared with 97 for all farm products. The recent rise in the price of wool was more rapid than that which occurred during the early months of the World War.

During the early years of the World War (1914-18), cotton advanced somewhat less rapidly than other farm products. This was due to the huge crop of 1914. Like the World War, the European war begins with large stocks of cotton in the United States. During the later years of the World War, cotton was high relative to other farm products because of less than average yields.

The farm price of wheat in Kansas advanced more rapidly than the general level of farm products. The fortunes of wheat farmers are dependent upon the acres planted, acres harvested, and yield per acre, as well as the price of wheat. During the early years of the World War, there was an unusually favourable combination of these factors that resulted in large production. The acreage planted expanded about 10%, and in 1915, 97% of that acreage was harvested. Consequently, with better-than-average yields, the nation produced a billion bushel crop, the largest on record. This country faces another great war with somewhat more than normal stocks of wheat, but a reduced acreage, and a con-

A NEW LIGHTWEIGHT TRACTOR with detachable plowing implements controlled by hydraulic power was introduced June 29, 1939, by Henry Ford

Fig. 1.—EFFECT OF WARS on wholesale prices of all commodities in currency in the United States, 1790–1938

dition reported to be the poorest in history.

The farm prices of corn and hogs advanced approximately with the average of all farm products.

The farm price of eggs in New York advanced less rapidly than the general level of all farm products. Previous to the outbreak of the World War (1914–18), there had been a very rapid expansion in the poultry business in the United States, and some liquidation would have occurred in any event. For this reason, egg prices lagged behind the advance in the prices of feeds and many other commodities.

Prior to the European war, there was a long period of liquidation in the number of chickens on farms. It seems reasonable to assume that with a prolonged war, egg prices will advance more rapidly relative to other things than was the case during the war of 1914 to 1918.

Apple prices lagged behind the general advance. The volume of exports of fresh and dried apples did not experience the sharp advance that took place in many other farm products. During the war in Europe, apple producers may lose a considerable part of their foreign market because of the orders issued concurrently by Great Britain and France prohibiting the import of apples, effective Nov. 20, 1939.

The farm price of hay lagged in the general advance.

Land Values.—During the World War, land values responded to the rise in commodity prices in all parts of the United States, but the amount of rise was unequal in different parts of the country. There are at least three reasons for these differences: (a) distance from the final market, (b) type of commodity produced, and (c) amount of cash costs.

Any force that causes commodity prices to rise results in an unequal reaction in the various components of the price structure.

Fig. 2.—INDEX NUMBERS of the physical volume of the agricultural exports per capita from the United States, 1866–1939

EXPERIMENTAL PLANTS are rolled out of a "darkhouse" for testing in the sunlight in 1939 at the U.S. Dept. of Agriculture's extensive research farm in Beltsville, Maryland

Basic commodities rise more rapidly than freight rates and marketing costs. This in turn causes prices of commodities far from market to rise more rapidly and a greater amount than the prices of the same products near markets. For instance, hay rose more in Nebraska than in New York. The index numbers of prices paid for farm products in North Dakota rose more rapidly and a greater amount than in New York. Farm prices in Oklahoma rose more than in New Jersey. A part of these differences may have been due to the types of commodities included, but a part was due to distance from market.

Somewhat higher prices were paid for the non-perishable and concentrated products of the Middle West, which were in somewhat greater demand, than for the bulkier and more perishable foods produced along the seaboard.

The Atlantic seaboard farmers have greater relative cash outlays for fertilizers, feed, and the like, which respond quickly to rising prices, than the grain and livestock producers of the Middle West. These factors resulted in a greater advance in land values in the Middle West. Because of the greater distance from the final market, a higher percentage of non-perishable and concentrated prod-

ucts, and smaller cash expenses, land values in Iowa advanced more rapidly than in New York.

Exports of Agricultural Products.—From 1865 to about 1900, the physical volume of the per capita agricultural exports from the United States trebled (fig. 2). With the turn of the century, exports started to decline, and this decline was interrupted only by the World War. Most of the decline during the past 40 years has been due to the failure of agricultural production to increase with our expanding population.

Despite the excessive demand for agricultural products during the World War, the per capita exports from the United States exceeded those of the immediate pre-war years in only one year, 1915, when the United States produced the largest per capita amount of food and feed crops in her history.

From 1910 to 1914, the American farmer raised 2.14ac. of the six starch crops, corn, wheat, oats, rye, barley, and buckwheat, the backbone of the U.S. food supply. During the succeeding war period, there was much agitation to increase the supply of grains. In spite of these efforts, the per capita acreage did not increase, averaging 2.14ac. in 1914-18, and there was relatively little shift in the production of crops in the older areas of the United States. The most striking change was in the acreage of wheat, which increased in Oklahoma, Texas, Montana, Idaho, and Colorado.

Since 1920, there has been a steady decline to about 1.6ac. in the per capita acreage of these crops. This decline was due to the increase in U.S. population with relatively little change in the total acreage of these crops.

From 1910 to the late '20s, there was relatively little change in the production per acre, the average being about 1,217 pounds. With the deflation of the '30s and the two severe droughts of 1934 and 1936, there was a drastic decline in the production per acre. With a declining acreage per capita and a stable to declining yield, the per capita production of these grains declined rapidly. During the World War, the nation produced about 2,600lb. of grain per capita, and since 1920, about 2,000 pounds. During the World War, the exports* represented about 15% of production; in the late '20s, about 10%; and during the last three good crop years, about 5%.

In recent years, the low commodity prices and dwindling exports have led to much discussion of the loss of the foreign market for U.S. agricultural products. As a matter of fact, in recent years, this nation has had relatively little to export but cotton, except in good crop years or when the supply of hogs was large.

Any attempt to purchase substantial quantities of food from the

*Exports of grain and grain products plus pork and pork products.

"THAT CUSTOMER'S BACK AGAIN." Ray of *The Kansas City Star* pictures the ever-present agricultural problem of raising prices and reducing surplus.

United States during the present conflict would result in considerable advance in the prices because supplies are so scanty.

If the population of the United States continues to increase, there will be little food to export even in the good crop years, and in poor crop years it will be necessary to supplement U.S. production with imports. (See also ALFALFA; CHEMURGY; CORN; DROUGHT; DRY FARMING; DUST STORMS; FARM INCOME; FARM MACHINERY; FARM MORTGAGES; FERTILIZERS; HAY; HORSES; IRRIGATION; LEGISLATION, FEDERAL; LAW (CASE): Agriculture; OATS; PRICES; WHEAT, etc.) (F. A. PE.)

Agricultural Planning.—One of the most significant efforts in the field of agricultural planning in the U.S. was launched during 1939. Definite progress was made during this first year of the co-operative land-use planning program started under the joint leadership of the Department of Agriculture and the State land-grant colleges.

Because of the rapid expansion, during recent years, of Federal and State efforts to deal directly with such problems as soil erosion, instability of farm prices, farm tenancy, and many others, and because of the fact that many of the programs directed toward solution of these problems were started during a national economic crisis, many instances have occurred in which two or more of the programs do not fit together as effectively as they might when they meet one another on the land.

The present agricultural land-use planning program is a co-operative effort on the part of farm people, agricultural technicians, and administrative officials of agricultural programs to work out immediate and long-term goals for each State, county, and community that will guide public programs and serve as a basis for obtaining better co-ordination between them. Emphasis has been given to the land-use aspects of agricultural planning because it is believed that this is a good place to begin. Land use is important because of its close relationship to the welfare of farm people.

FIG. 3.—INDEX NUMBERS OF PRICES OF 40 BASIC COMMODITIES IN THE WORLD IN GOLD AND IN THE UNITED STATES IN CURRENCY AND OF THE PRICE OF GOLD IN THE UNITED STATES, 1929-1939. From 1929-1933, commodity prices in the United States followed the downward course of the world price level (left). In the spring of 1933, the United States left the gold standard and the price of gold was raised from \$20.67 to \$35 per ounce (right). Commodity prices in the United States rose relative to the world (left). The area between the world price level and the United States price level (left) is about equal to the area between the old and the new price of gold (right).

In nearly two-thirds of the agricultural counties in the United States, county planning committees have been organized to conduct land-use planning work. The membership of each committee includes from 10 to 20 farm men and women together with representatives of Federal, State, and local agencies responsible for agricultural programs. In many of the counties, community committees have been established to assist in the work. Also, there is a State committee, similarly composed, for each State.

These committees are studying the facts regarding the physical and economic characteristics of each area and, on the basis of their interpretations, are making recommendations for improving the application of public programs to local conditions. In 800 counties, the committees were doing intensive planning work during 1939. They delineated the various land-use problem areas in each county, assembled information regarding the characteristics and problems of each area, and made recommendations for desirable adjustments. Several of the county committees prepared reports that are now used by the various agencies in the formulation of administrative policies.

Considerable attention has been given to the problem of finding the most effective methods of converting the recommendations of land-use planning committees into action. As an approach to this problem, at least one county in each State is attempting to develop a unified plan of action for administration in 1940. The planning committees in these counties have selected a few of the problems that need to be dealt with in achieving the objectives which have been agreed upon, and have translated their recommendations with reference to these problems into specific proposals for action. In a number of cases public agencies have agreed to make substantial modifications in the local application of their programs as a part of a co-ordinated attack on specific problems. Some of the proposals have already been acted upon.

The procedure which has been adopted for doing the job of land-use planning is based on the philosophy that farm people should participate in the formulation of administrative, as well as legislative policies, and that their participation is required to do the most effective job. However, the results of this work do not represent farmer opinion alone; rather, they represent a combination of the practical wisdom of farm men and women, the technical judgment of experts, and the experience of administrators. The accomplishments that were made during the first year indicate that continued improvement in the application of farm programs is likely to result from the land-use planning work. (B. W. A.)

Air Conditioning. The year of 1939 witnessed continued advance in the technique of air conditioning. Also, there was a substantial gain in sales volume over the previous year, stimulated by improved business conditions and by an increased public recognition of the benefits of air conditioning.

General Business.—While the United States is still the world centre of broad air-conditioning acceptance, various parts of South America and the West Indies are continuing to make strides in this direction, largely with equipment imported from the United States. The awakening air-conditioning interest which had just begun in certain parts of Europe has undoubtedly been stifled by the war. Contemplated further activity in Southern Africa has probably been deferred for the same reason.

Air-Conditioning Technique.—There were no new and radical developments in the art of air conditioning during 1939, but a number of refinements in product design and application practice make the year notable in the history of air conditioning. In the field of large central plant conditioning a number of important installations were completed. An outstanding feature of these installations was the development of improved individual control for each air-conditioned room. The day has passed when a single

control station will regulate in acceptable manner the conditions in an entire building or even all the rooms on one floor of a large hotel or office building. In medical circles it has been recognized for some years that individual requirements vary due to age, sex, state of health, and other factors. Now the designer of central plant air-conditioning systems is prepared to make individual room control available in practical form, either with room units operating from a central supply or with zone control from a central conditioner. Another notable refinement is the improved appearance and balancing facilities now available in newly developed air delivery and exhaust fixtures for rooms. One outstanding installation employs a combination air delivery and electric light fixture mounted in the ceiling at the centre of the room. The air is delivered through an annular orifice so designed into the fixture that it is not recognized as an air delivery opening but rather appears to be part of a modernistic styling. Behind the orifice are a series of adjusting dampers which provide for an extremely even delivery of a sheet of air high overhead, from which position it is drawn slowly to the floor without draught. The exhaust openings are somewhat similarly built into the metal baseboard in such a way that they cover the entire exposed perimeter of the room and are very pleasing to the eye. The even and draughtless air distribution in these rooms is probably as perfect as any yet produced in commercial application.

Small air-cooled portable room units for summer air conditioning have been substantially improved in reliability and performance. They are now available in a larger variety of sizes and at lower prices than heretofore. Sales of this type of unit in 1939 increased several times in volume over 1938 sales and their popularity indicates a further increase in sales volume during 1940. Ultimately this unit will represent a very large volume item to successful manufacturers. For large rooms, small suites of offices, and other similar applications, the self-contained water-cooled summer conditioner has also made great strides. It is compact, easily installed and relatively low in cost. Such units are rapidly displacing the central type of system, in applications up to about ten tons of cooling capacity. (A ton of cooling capacity is the equivalent in cooling effect to that obtained from the melting of a ton of ice in 24 hours.) A ten-ton unit will handle a typical small store or shop, a restaurant seating perhaps 150 people or a suite of six to ten average sized offices. A simple duct system would be required for the latter. A successful large store installation was made in 1939 mounting six ten-ton units around the sides of the store on the first floor, installed with a minimum of ducts for air delivery.

Both the small air-cooled and the larger water-cooled units provide for cooling, dehumidifying, circulating, and air cleaning, as well as ventilation in many instances. They may be used for circulation, air cleaning, and ventilation in the winter time, and winter heating and humidifying can be added to the large units, if year-round air conditioning is desired.

Winter air conditioning continues to grow in popularity and acceptance, particularly for homes, where the benefits of circulated, heated, humidified, and filtered air are especially appreciated.

Physiological Benefits.—The full benefits of air conditioning to health still remain to be completely identified and investigation work along this line continues in various schools and medical centres. However, it is now generally recognized that proper air conditioning provides definite benefits to most sufferers from hay fever and pollen asthma, as well as to certain post-operative hospital cases. There is definite indication, yet not fully proved, that it tends to prevent transmission of the common cold. (See also FLOUR AND FLOUR MILLING; PUBLIC HEALTH ENGINEERING.)

(EL. HA.)

Aircraft Carriers: *see* AIR FORCES: Navy; NAVIES OF THE WORLD.

Air Forces. Army.—The year 1939 was especially significant to the United States Army Air Corps. In 1909, the Wright brothers had delivered to the United States Army the world's first military aeroplane. On the thirtieth anniversary of that event was inaugurated the greatest peace time expansion of the Air Corps in U.S. history. Congress authorized and appropriated \$302,000,000 for the purpose, \$50,000,000 of which was made available before June 30, to initiate a systematic two-year augmentation program.

The requirements of this expansion include the training of pilots and mechanics, the procurement of aircraft and equipment, and the construction of new bases. Eighteen thousand enlisted men are to be trained as specialists in the technical subjects relative to the operation of aircraft and accessories. Of these, 1,000 men will be trained at civilian mechanic schools, and the remainder at the three branches of the Air Corps Technical school: Chanute Field, Rantoul, Illinois; Scott Field, Belleville, Illinois; and Lowry Field, Denver, Colorado. There are 4,356 flying cadets to be trained as pilots, all of whom are to enter training prior to Oct. 1, 1940. The last of these classes will be graduated in June 1941. Another requirement of the expansion program includes the provision of a total of 5,500 aeroplanes by July 1, 1941. This program required careful planning to the end that all of the components—materiel, personnel, and training—be balanced, so that no part would be weakened by inadequacies or over-stressing of any other part. The chief of the Air Corps made his plans in recognition of the fact that the military air forces can be utilized successfully only when all factors which contribute to air power are utilized as a whole: personnel, materiel, bases, research, procurement, supply, installations, training, and operations.

In addition to this great task of expansion, some of the outstanding accomplishments of the Air Corps during 1939 were:

- (1) The breaking of six international flying records, including the carrying of heavy loads to altitude at high speed, and flying long distances with heavy loads at high speed.
- (2) The formation of a production engineering section of the Materiel Division to meet the expansion program.
- (3) The expansion of the experimental engineering section of the Materiel Division throughout its five main laboratories.
- (4) The transfer of the chief of the Materiel Division and his staff to the office of the chief of the Air Corps, in Washington.
- (5) The preparation over a nine-months' period of contracts for procurement and construction amounting to more than \$197,300,000.
- (6) The furtherance of technical studies on the subject of vibration and flutter in aeroplanes; the continuance of tests on automatic flight and landing; the development of auxiliary power plants for aeroplanes; the application of stainless steel to the complete aeroplane structure; and the development of a large four-bladed propeller.
- (7) Important improvements in military photography. Tests were made to develop large-scale prints suitable for lithographic reproduction, thereby making practicable their use as substitutes for maps. To aid in the detection of camouflage, colour photographic equipment was studied. Night photography was advanced by experimentation. Progress was made in high-altitude and long-distance large scale photography, using infra-red film and a 60-inch telephoto lens mounted on a K-10 camera body.

As a result of this program the GHQ Air Force will have been expanded by June of 1941 to eight bombardment groups, six reconnaissance squadrons and five pursuit groups. Plans have been made for the increase in the number of air bases from the present number of six to eleven. (*See also* ARMIES OF THE WORLD.)

(H. H. A.)

Navy.—The Bureau of Aeronautics has continued, during the year 1939, to develop, procure, and maintain aircraft in accordance with Fleet needs. The aircraft program resulting from the requirements of the Treaty Navy has been completed and a definite, orderly plan established to provide aeroplanes and to train aviation personnel for the increased Navy authorized by the Naval Expansion Act. Existing shore facilities to support the operating aircraft are being developed in direct proportion to the funds

available. The need for additional facilities on the East coast, in the Alaskan area, and in the mid-Pacific islands was recognized by the Hepburn Board, appointed during the year, and as a result of its recommendations the 76th Congress, first session, authorized the expenditure of funds for construction, which, when realized, will provide aviation facilities in outlying strategic areas as well as on both continental coasts, and for the expansion of certain of the already established stations.

The aircraft carriers U.S.S. "Yorktown" and U.S.S. "Enterprise" joined the Fleet early in the calendar year and a contract was awarded for an additional ship of this type, to be known as the U.S.S. "Hornet."

Two hundred and seventy-two aeroplanes were ordered to replace those worn out in service or lost due to crashes, and to expand the Naval aeronautical organization in accordance with the Naval Expansion Act. This number includes several new types, embodying considerably advanced performance, which are being supplied to Fleet squadrons as rapidly as contract deliveries permit. At the end of the fiscal year, June 30, 1939, the United States Navy had on hand approximately 2,250 aeroplanes.

All combatant ships of the Navy, with the exception of the destroyers and submarines, carry their own complement of aeroplanes, varying in number from two to three on the battleships to 75 on the aircraft carriers, the types used being determined by the missions of the surface ship to which they are attached. The requirements for carrying out these missions have brought into being aeroplanes possessing mechanical features and capabilities that differ greatly from aeroplanes operated by land-based military forces and by commercial aviation establishments. Continuous efforts are being made to keep to a minimum the number of types, by designing each to perform the maximum number of functions.

The following is a brief description of these basic types:

- (a) The fighting plane represents the maximum in performance, manoeuvrability, and gunnery, is small and high-powered, with the primary mission of attacking enemy aircraft with gunfire.
- (b) The torpedo and bombing planes, the largest type employed in the carriers, are designed to attack enemy heavy vessels or shore bases. An important type under this classification is the dive-bomber, which, as its name suggests, delivers its attack in a vertical or near-vertical dive on its objective, either ashore or afloat.
- (c) The scouting and observation planes require speed, range, good gunnery defence, and excellent facilities for radio, in order to accomplish their missions of scouting for the cruisers and carriers and observing for the battleships.
- (d) The patrol plane is the largest type in service in the Navy, its size being necessitated by the fact that the craft must be capable of great range, be seaworthy, and sufficiently habitable to permit operating for protracted periods independent of its base. In addition, the patrol plane must be self-protecting while carrying out long-range strategic scouting flights, and must be capable of joining the Fleet at any time.

Aerodynamic and engine research, coupled with development of more effective and powerful armament, continuously result in advancing types of naval aircraft.

(J. H. Ts.)

The World.—Contrary to expectation, the year 1939 came to an end without providing definite answers to many questions that have been debated by air strategists and tacticians for a decade. When war broke out in September between major European powers it was freely predicted that the first few weeks would provide the data necessary for the final evaluation of the real worth of the air arm in modern warfare. In preparation for any eventuality, air defences of all sorts were fully manned, cities were sand-bagged and partially evacuated, and nightly black-outs have become an accepted phenomenon. But after four months of war no one is yet certain of the role that aviation is to play in the conflict. So far, whatever strategic gains have been made, have been brought about by the threat rather than the application of air power. (*See also* CHEMICAL WARFARE; TACTICS IN THE EUROPEAN WAR.)

The modern military aeroplane is a far more effective weapon than its prototype of 1918. Where the best single seater fighters of that period had top speeds of 100-120 m.p.h., corresponding types

today (January 1, 1940) are operating in the 350-400 m.p.h. range, and higher speeds are expected in the immediate future. Where the bombers of 20 years ago carried a relatively few pounds of military load at 80 m.p.h. for a few hundred miles, today's so-called medium class machines easily handle a ton or more of bombs over 1,000-1,500 mi. ranges at speeds upwards of 250 miles per hour. Much larger bombers are in being and in prospect, capable of carrying several tons of explosives over several thousands of miles at 250 m.p.h. or better. The four-engined Boeing "Flying Fortresses" of the U.S. Army Air Corps, the Junkers 90s of the German Luftwaffe, and the new Fairey and Handley-Page bombers of the Royal Air Force, are typical of the best machines in this category.

These trends have given rise to questions (as yet unanswered) as to how such aircraft are to be used most economically and most effectively. What, for example, is the real mission of the modern bomber? Will its use be limited to purely military objectives, or, as the disciples of General Douhet claim, can it be used most effectively in great armadas in overwhelming attack against industrial centres and against civil populations in order to force a quick change in a national viewpoint by destroying morale and the will to resist? Can massed bombers be used effectively against naval vessels at sea? Then, what is the proper function of fighter aircraft? Is its only mission to protect the great bomber fleets, or is it to be used primarily to achieve domination of the air space over land and sea operations to prevent enemy observation of troop or of ship movements? What of the tactic of dropping bodies of troops by parachute behind enemy lines? How good are modern aircraft detectors, or anti-aircraft guns, or balloon barrages for defence against air attack? How effective are bomb shelters? How good is modern camouflage? Will air power or sea power dominate the world trade routes of the future? These are but some of the questions still to be answered, questions whose final solution may effect profound changes in national policies and which may easily affect the course of history.

Military operations of the last few years in China, in Ethiopia, and in Spain failed to shed much light on the problem. In China and North Africa campaigns were conducted by nations with powerful air forces against opponents with little or no retaliatory air strength. Spain, as far as the major European powers were concerned, was little more than a laboratory for the testing of certain new tools of war. No nation had enough interest in that conflict to warrant the disclosure of its latest methods or equipment. The scale of aerial operations was much the same as that of 1918.

The German campaign in Poland was different. It yielded some very definite clues, but did not provide final answers. There is little doubt, however, that the swift success of early September was due to the efficient use of massed air power against military objectives. Germany's first move was to put the Polish air force completely out of action by concentrated attack against the Polish aerodromes. By rendering the air bases untenable, the Polish air force, such as it was, was completely immobilized, and assistance by air from England and France became impossible because the flying fields from which their aeroplanes would have operated had been destroyed. The complete story is not yet available, but there can be no question but that the employment of aircraft in large numbers was the *sine qua non* of Hitler's blitzkrieg in Poland. (See also LIGHTNING WAR.)

But whatever aerial tactics and strategy evolve as the present conflict goes on, immediate interest lies in the relative air strength of the belligerents. For obvious reasons, few factual data have been released by the several powers, but a number of estimates have been made by qualified observers over a period of several years that provide a basis for estimation. Any evalua-

tion must take into account a great deal more than the alleged numbers of aircraft on hand. Even if reasonably accurate figures for the totals were available, the difficulty of making a proper distribution between "first line" and "reserve" aircraft still remains. Clearly, however, there is more to it than the possession of a large number of machines. The aircraft must be up-to-date as far as performance is concerned, and they must be types adaptable to the purposes at hand. They must have competent pilots to fly them, and they must be served by well trained maintenance forces in the field. Most important, the organized air force must be backed up by an aviation industry capable of producing large quantities of first-rate aeroplanes, engines, and accessories.

The basic elements of air power may be reduced to six general items, as follows:

1. Number of aircraft (including "first line," reserves, and trainers).
2. Quality of aircraft (including performance, efficiency of design for construction and maintenance, materials used, etc.).
3. Production rate (during the immediate pre-war period).
4. Productive capacity (maximum probable in war-time).
5. Personnel available (pilot, ground crew, industrial).
6. Morale (industrial and national).

At the conclusion of this article will be found an estimate of the relative strength of the major European powers as of the end of 1939 based on a point scoring system to give a composite picture of the standing of the countries with respect to these six elements of air power. This method of comparison was first used in an article "Box Score" which appeared in *Aviation* magazine for Jan. 1939. A comparison with the present figures gives an indication of the changes that have taken place during 1939.

Apart from the difficulty of obtaining accurate figures on air strength under current circumstances, the second and the sixth elements in the above classification obviously do not lend themselves to exact statistical analysis. Quality of aircraft may be gauged not only by the performance records set, but by the general appearance of the machines and their components. It may also be measured by the amount and kind of aeronautical and allied research that is conducted by the several countries involved. In such a highly technical field, it may well be that wars will be won in the laboratories rather than on the actual field of battle.

As for morale, no attempt has been made here to compare the fighting ability of the pilots of the several nations collectively as tactical units, or as individuals. The safest assumption to make at this time (until experience proves otherwise) is to rank them all equally on that score. The rating of morale, therefore, is intended to reflect the industrial, rather than the military situation. In this case, it is limited to the aviation industries. It takes into account such things as the social and political situation, the general conditions of labour in the aircraft factories, the degree to which labour is controlled by the State, and the general economic condition of the country.

Germany.—Since 1933, Germany has attained front rank among the air forces of the world. The exact numbers of her military aircraft are not accurately known, but it seems probable that her total air fleets, excluding purely primary trainers, probably number over 12,000 machines, of which at least two-thirds are in organized squadrons of the Luftwaffe or in the active Luftwaffe reserve. The remaining fleet is made up of machines that were designed and built during the early reconstruction years, now obsolete for first line use, but which constitute a very real part of Germany's air strength for short range bombing operations in mass, and for training purposes. In quality, her first line machines must be ranked high in terms of their per-

formance and their ability to meet the requirements of active duty as defined by the German general staff. Extensive research laboratories, manned by a large and well trained personnel, provide the designers of the Reich with aerodynamic and structural information of the highest order. The average German machine may not have the finished appearance that characterizes U.S. military aircraft, but it has been designed for rapid production, the materials have been used efficiently. Its performance is up to modern standards, although average life expectancy may seem short as compared with normal commercial aircraft, but it is undoubtedly long enough to cover the probable period of usefulness as a military weapon. Production rates of such machines have been very high during the past two years. During 1938 and early 1939 the average was probably close to 500-600 units per month with at least one month known to be over the 1,000 mark. Since the outbreak of the European war the probabilities are that the average output has been better than 1,000 units per month, which represents a high percentage of actual productive capacity. Few figures are available as to the number of active pilots in Germany, but it is known that thousands of young Germans have been in training over a period of four or five years on gliders and on powered machines so that the probabilities are that at the outbreak of the European war Germany had the largest number of active and reserve pilots of any nation in the world. Since September it may be assumed that the production rate on pilots has been tremendously increased. As for the industry personnel, as early as 1936 it was known that well over 100,000 people were engaged in building aircraft and in building aircraft engines and accessories, a figure that was doubled by 1938 and probably trebled at the present time. As for morale (as defined above) unless extreme economic pressure is causing radical changes in internal affairs at the present time (Jan. 1, 1940), Germany must be given as high a ranking as any in Europe because of its system of absolute labour control and the improbability of production breakdown due to strikes and other similar causes.

England.—Although England let her aeronautical industries lag far behind Germany up to the close of 1938, she has been making a valiant effort to achieve something like parity with the German air force. Progress has been rapid during 1939, but she has not yet succeeded in closing the gap entirely. It seems unlikely that her air fleets would total more than 60% of Germany's at the present time, but her production rates are climbing rapidly and productive capacity is being expanded so that another year (assuming that no economic upset or military attack disrupts her manufacturing system) should bring equality. Her newest machines are all first rank as far as quality goes from a performance and production standpoint, but the Royal Air Force is hampered by having on its active rosters a large number of machines of designs dating back three or four years. This situation is being corrected but at the present time it is necessary to rank the general quality of the British machines slightly below that of the German. Great Britain is now in the midst of an elaborate training program to provide thousands of new pilots for the Royal Air Force. Also her industries are building up their man power, but in both respects England is lagging behind Germany by at least a year and perhaps longer. It will be some time before the great training program set up for Canada can have any influence on the active personnel in the Royal Air Force. Again, it will probably be at least a year before parity can be attained with Germany on both flying and ground personnel. As for morale, although there is nothing finer in the world than the morale of Great Britain's air force, her manufacturing industries are subject to the conditions which prevail in any democracy. Labour cannot be controlled as absolutely as in the totalitarian states and the production of necessary equipment and material is subject to interruption from

strikes and other types of labour disturbances. For that reason, the general industrial morale must be rated somewhat under that of Germany's at the present time.

Russia is still very much of a question mark because little accurate information is available. She undoubtedly has large numbers of aircraft but there are reasons to believe that the performance of these machines is not up to modern standards. Her production rate and production capacity are probably below those of Germany and England, and although her man power both in pilots and industrial personnel is probably the highest in Europe, the general state of unrest and disorganization in the Soviet Union puts the general morale rating toward the bottom of the list. Two years ago there was reason to believe that the Russian air force was the most powerful in Europe, but with changing conditions it seems unlikely that they rank higher than third at the present time.

Italy, although a neutral, probably controls the balance of air power in Europe. She has accumulated a considerable amount of equipment, personnel, and experience in her active campaigns in Ethiopia and in Spain. She has a relatively large number of aircraft on hand as a result of these campaigns, but from a performance and production point of view they are not comparable in quality with either the German or the British output. Production rate is also below either of those two countries and the actual capacity to produce is probably not appreciably greater than the actual output of the last two years. She probably has a relatively large number of trained pilots with a certain amount of active experience, but industrial personnel is limited both in number and in skill for producing modern aircraft. The Italian situation is somewhat similar to the German in that, as a totalitarian state, labour may be fairly well controlled although there are elements in the picture that make it necessary to scale the morale factor down below that of Germany, and even below democratic England under present conditions.

France has allowed her air force to slip back from the front ranking position which she retained from the ten years after the war of 1914-18 to no more than fifth place in European aviation. Although she carried large numbers of aircraft on active rosters up to a few years ago, most of those machines were obsolete and many of them were entirely out of commission. Due to unfortunate social and economic conditions of the past five years, she did not keep her aircraft-producing industries up to modern standards. This has been reflected in a very serious dropping off in the quality of French aircraft from a production point of view and has dropped the production rate to a figure far below either Germany or England in the pre-war years. Her productive capacity has also suffered, all of which has been reflected recently in the necessity for placing large orders for aircraft and engines in the United States to supplement her own limited output. At the close of 1938, at a time when Germany was producing 500-600 aeroplanes a month and England 200-300, French output was down to approximately 70 units per month. Since the outbreak of the war France has been increasing her personnel engaged in aviation both in pilots and in industry. The morale of her individual pilots is of a very high order, but the general social and working conditions of the past few years in France have reduced the industrial morale to probably the lowest level of any of the major European countries. Under emergency conditions improvements are now in evidence, but much ground has been lost in industry that will take some years to regain.

Based on the general conditions outlined in the preceding paragraphs, the accompanying table has been set up to measure the relative strength of the five European air forces as of the end of 1939. For each of the six elements of air power, ratings have been assigned to each country as compared with Germany, for at pres-

NEW YORK CITY'S \$40,000,000 NORTH BEACH AIRPORT as seen from the air during its dedication Oct. 15, 1939. In the foreground is the seaplane base with a transatlantic plane riding at anchor

ent the German air force must be the yard-stick against which air power in Europe must be measured. Total point scores of each country have been added and divided by six to give average ratings. (See also AVIATION, CIVIL; EUROPEAN WAR; STRATEGY OF THE EUROPEAN WAR.)

Relative Strength of Five European Air Forces, End of 1939

	Germany	England	Russia	Italy	France
Number of planes . . .	10	6	8	5	3
Quality . . .	10	9	5	6	5
Production rate . . .	10	7	4	4	2
Production capacity . . .	10	8	6	4	4
Personnel . . .	10	7	10	5	6
Morale . . .	10	8	6	7	6
Total points . . .	60	45	39	31	26
Average Score as of end of 1939 . . .	10.0	7.5	6.5	5.2	4.2
Average Scores at end of 1938 as published in Aviation, Jan. 1939 . . .	10.0	5.0	7.6	6.3	2.5

Air Mail: see AVIATION, CIVIL; POST OFFICE.

Airports. While airport construction began during the World War, it was not given serious attention until a few years later, when civilian flying was found to be greatly hampered by inadequate landing facilities.

In its present usage "airport" is applied only to a flying field which has been graded, drained, and provided with the necessary buildings and facilities for housing and handling aircraft. "Flying field" is now applied to the portion of an airport which is used for taking off and landing and to unimproved areas which are used for flying operations. "Emergency field" is used to designate an area (generally small and having no buildings of conse-

quence) which is maintained for emergencies. Where regular service is operated it has become common practice to provide emergency fields along the route—which thus becomes an "airway." This began soon after the first regular services and has reached its highest development in the United States, where the Civil Aeronautics Authority by 1939 controlled 24,249mi. of domestic airways equipped with lights or radio beacons or both, and where the total of Federal-equipped airways will reach 29,199mi. in 1940. This system links together 1,145 municipal, State, and commercial airports, with an additional 258 Government emergency fields, and has a total of 728 airports and fields equipped for night flying. Part of this was constructed during the depression in connection with unemployment relief; during the past several years the U.S. Works Progress Administration aided in local airport work to the extent of more than \$112,000,000.

Many airports have runways 4,000 to 5,000ft. long; LaGuardia Field at North Beach, N.Y., has a 6,000-ft. runway and one of the new Tempelhof runways is about 7,500 feet. Airports with total areas of 750 to 1,000ac. are coming into existence—affording a vivid comparison with the 100 to 150ac. that were acceptable not much more than ten years ago.

Plan.—The arrangement most generally accepted for airports is that of grouping all buildings at one side of the plot in order that the other sides be free of obstructions. However, the plots vary so much in shape that each airport takes on its own individual characteristics and it becomes impracticable to call any one "typical." It is equally difficult to point to specific airports as "best" or "biggest," because of the constant improvement and the divergent conditions. Taking area as one criterion, the world's largest is probably Randolph Field, the U.S. Army training centre in Texas. This has a total area of about 2,300 acres of which some 500 acres are used for buildings. Cleveland Municipal Airport ranks as the largest civil airport with its total of 1,040 acres and

Le Bourget, with 812 acres is probably second. Most centrally located airports are Tempelhof (Berlin) and La Guardia Field (North Beach, New York city), the first being on a subway line and the second on a city boulevard. The Municipal Airport of Newark, N.J., has heretofore handled the greatest volume of civilian air traffic, with Chicago Municipal Airport second. However, the recent opening of La Guardia Field is now changing the relative status of these and preliminary figures indicate that this airport is likely to take the world lead in civilian traffic in 1940.

Airways Traffic Control.—Increased traffic brought also a need for some extension of airport control to airways, particularly to avoid collisions when visibility turns poor. In the United States a most complete system has been developed which is based upon radio communication with the pilots; airliners operating over important routes maintain regular communication with control stations along their routes. Through radio telephony the pilots are informed of weather changes, notified of the proximity of other aircraft and given flight orders. Flying along an airway each aeroplane is required to maintain its assigned altitude and to fly somewhat to the right of the centre of the airway as indicated by the signals emanating from its radio beacons. These beacons emit two signals which merge into a steady hum when the aeroplane is on the course, because it thus receives both signals with equal intensity.

Divergence to either side causes that signal to come in stronger than the other, thus informing the pilot when he is off his course as well as indicating the side to which he has drifted. Radio transmission has also been used for effecting "blind" landings of aeroplanes in Europe and the United States, and Germany actually had at least 16 of her civil airports equipped for "blind" landings by the end of 1938. The radio landing method depends upon reception of special local signals which are picked up when approaching the airport. These signals keep the pilot informed of his position and altitude with respect to the runway on which he is to land and make it possible to effect a landing with reasonable safety even in a fog. The difficult problem of choosing a standard system has delayed the general installation of such landing equipment in the United States to date. In 1938 perfection of the "terrain clearance indicator" was accomplished and this device should be of further aid in blind landings as it indicates the distance from the terrain below regardless of the altitude with respect to sea level. Noteworthy airport construction of the past several years includes the expansion at Le Bourget and at Croydon; the tremendous new building group at Tempelhof and New York's new airport of La Guardia Field at North Beach. This last mentioned project was constructed by the heroic method of filling in some 400ac. of Flushing bay to provide a total of 558ac. and permit runways up to 6,000ft. long. Built by the city with assistance of the U.S. Works Progress Administration, at a total cost of about \$40,000,000, to date, this airport was opened in October of 1939. Pan American Airways' chain of facilities across the Pacific still remains the most daring airport development of recent years. This organization now operates 62,889mi. of route, has 193 regular ports of call and (including other airports and emergency facilities) it has more than 300 bases in all. The Pacific chain includes many unusual airports, one being the Wake Island base which had to be constructed on a tiny and formerly uninhabited island over 1,000mi. from the nearest other land in the Pacific.

Air Races. John Livingston of Waterloo, Iowa, again won the important Glenn H. Curtiss Trophy flight at the Miami, Fla., meet, flying 156-806 m.p.h. in the race for planes of 850-inch-or-less piston displacement. Anthony Levier of Montebello, Calif., was second, and Steve J. Wittman of Oshkosh, Wis., third.

In the women's feature at Miami, the K. K. Cluver Trophy race, Mrs. Edna Gardner of New Orleans, La., was the first to cross the finish line in her 125 h.p. monocoupe, averaging a speed of 117.2 miles per hour. Miss Edith Dexcomb of Hartford, Conn., was second, and Mrs. Bessie Owens of Santa Barbara, Calif., third. The actual fastest time was attained by Mrs. Owens who flew 147-017 m.p.h. in her powerful Beechcraft.

The famed Bernarr Macfadden Trophy with a cash prize of \$2,000 for the winning flier in the race from New York to Miami went to Max Constant of Hollywood, California. Lieutenant Commander Russell Holderman was second. Constant flew Miss Jacqueline Cochran's Beechcraft and covered the 1,195mi. in 5hr. and 43min., 39 seconds. His average speed was 204.227 miles per hour. J. H. Woods of Charlotte, N. C., won the Firestone Trophy.

Colonel Roscoe Turner again won the Thomson Trophy race falling just short of his 1938 record. He triumphed at the National Air Races at Cleveland, Ohio, and at the conclusion of the meet announced that he would retire from air racing, which he termed a "young man's game" to open a flying school in Indianapolis.

Alabama, one of the "deep South" States of the United States, admitted to the Union 1819; area, 52,250 sq.mi.; population (U.S. census, 1930) 2,646,248; estimated Jan. 1, 1940, at 3,000,000. Capital, Montgomery, 66,079. Cities with larger population are Birmingham, 259,678, estimated Jan. 1, 1938, 300,000, and Mobile, 68,202 (1930), estimated 80,000, Jan. 1, 1939. Of the State's population 744,278 were urban (1930), or 28.1%; 1,700,775 whites; 944,834 coloured; 2,630,370 native born; 15,878 foreign born.

History.—The most striking fact in the State's modern economic history has been the rise of manufacturing and transportation development. In politics the Democratic Party has dominated. The Republican Party has persisted since 1868, but has exerted little influence in State politics. Alabama has had five constitutions, those of 1819, 1865, 1868, 1875, and 1901. The constitution of 1901 contained notable innovations: the term of executive and legislative officials was extended from two to four years and executive officers cannot succeed themselves. By an amendment, July 1939, legislators are to be elected biennially. Twenty-four of the 67 counties now permit the sale of hard liquors. The traffic is under the supervision of the Alcoholic Beverage Control Board.

Chief officers of the State elected for service beginning Jan. 16, 1939 are: governor, Frank M. Dixon; lieutenant-governor, A. A. Carmichael; State auditor, Howell Turner; secretary of State, John Brandon; State treasurer, C. E. McCall; attorney-general, L. J. Lawson; superintendent of education, A. H. Collins; commissioner of agriculture and industries, Haygood Paterson.

Education.—A well defined system of elementary and high schools and colleges for both races is maintained. Elementary education is free between the ages of 6 and 21, and compul-

sory between the ages of 8 and 16. State appropriations in 1939 amounted to \$13,025,821. Total revenues from all sources were approximately \$25,229,779. Illiteracy among whites between 10 and 20 years is 1.9%, coloured 2.6%. There are seven State-supported institutions of higher education for whites and three for Negroes. Several colleges are maintained by the Methodists, Baptists, and Catholics.

Charities and Correction.—The State supports many philanthropic and penal institutions; institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; and a reformatory school for Negro boys; a child welfare department; juvenile courts; a model State prison and a penitentiary system in which the State provides employment for its convicts.

Banking and Finance.—In 1938 there were 65 national banks with a capital of \$21,225,000, deposits of \$122,301,000 and total assets of \$155,707,000; 152 State banks with a capital of \$14,958,158, deposits of \$77,817,875, and total assets of \$94,065,444. Revenue sources include a property tax, income tax, sales tax, privilege taxes, and levies on gasoline, tobacco, beer, and liquor. Receipts for the fiscal year ending Sept. 30, 1938, were \$55,987,312; disbursements, \$57,239,498; State debt, \$68,100,000.

Agriculture, Manufactures, Mineral Production.—Alabama ranked second among the cotton-planting States in 1860. Many crops are produced in large quantities, but cotton is still the most important one. The State had an estimated output of 1,080,000 bales in 1938. In 1935 there were 273,455 farms covering 19,660,828 ac. with lands and buildings valued at \$368,219,654.

In 1929 there were 2,848 establishments hiring 132,200 workers and producing goods valued at \$560,378,132. In 1937 there were 1,781 establishments, but industrial payrolls and employment almost reached 1929 levels. Twenty-five industries were established with an invested capital of about \$50,000,000. The two great basic industries are cotton textiles and iron and steel. Other important industries are lumber, blast-furnace products, cast-iron pipes and fittings, cotton-seed oil and meal, coke-oven products, cement, and electric power. The manufacture of electricity is one of the State's most important industries. The capacity of the generating plants of the Alabama Power Company is about 900,000 h.p., and the TVA plants in the State are capable of producing slightly more. There are about 6,000 mi. of rural electric lines. The mineral output of the State was valued at \$53,518,993 in 1937 with coal and iron ore leading. (A. B. Mo.)

Alaska. Alaska, in its greatest extent is included between the meridians of 130° West longitude and 173° East longitude and between the parallels of 51° and 72° North latitude. It is bounded on the north by the Arctic ocean; on the west by the Arctic ocean, Bering strait, and Bering sea; on the south and south-west by the Gulf of Alaska and the Pacific ocean; and on the east by the Yukon Territory and British Columbia. The eastern boundary, from the Arctic ocean to the neighbourhood of Mount St. Elias, is the 141st meridian; thence south-eastward to Portland canal it is irregular and cannot be described in general terms, except that it runs approximately parallel to the irregular shore line and about 30 miles therefrom.

Alaska is in approximately the same latitude as the Scandinavian peninsula; Point Barrow, its northernmost point, is in about the same latitude as North Cape; Dixon Entrance, which marks its southern boundary, is nearly on the same parallel as Copenhagen; St. Elias is in the latitude of Oslo and Leningrad; and Sitka is in the latitude of Edinburgh. The longitude of the western terminal of the Aleutian islands is almost identical with that of the New Hebrides islands and is the same as that of New Zealand,

and Cape Prince of Wales, the most westerly point of the mainland, is nearly as far west as the Samoan islands. Thus a person travelling from New York to Attu island, the westernmost of the Aleutian chain, on reaching San Francisco will have accomplished less than half the journey from east to west.

The area of Alaska is about 586,400 sq. mi., one-fifth that of the United States. A map of Alaska superimposed on a map of the United States of the same scale, demonstrates that the distance from the easternmost to the westernmost point in Alaska is equal to the distance from the Atlantic to the Pacific in the latitude of Los Angeles, and that its northernmost and southernmost points are nearly as far apart as the Mexican and the Canadian boundaries of the United States.

ERNEST H. GRUENING, appointed governor of Alaska Sept. 2, 1939

Alaska's chief products are fish, metals, and fur. In 1939, fish and fish products shipped from the Territory were valued at \$42,869,726. Of this amount \$36,636,897 represents the value of canned salmon alone, which is the principal industry of the Territory. The total value of mine

products shipped to the United States in 1939 was \$28,607,000, of which the gold shipments amounted to \$23,170,000. Furs valued at a total amount of \$2,829,500 were shipped from Alaska during the calendar year 1938, a decrease of nearly \$485,000 from the previous year.

In the continued development of Alaska, the prime necessity is to improve transportation, primarily through the expansion of aeronautical developments, but also by extending roads to open up new areas for mining and possibly for agricultural development—although the opportunities in this latter field are distinctly limited.

The outlook for further aerial development is promising. Trial flights have been made between Seattle and Juneau. It is hoped that in the near future regular scheduled flights will connect the States with the Alaskan capital, and connect there with existing scheduled air service to Fairbanks. The Matanuska colonization project may still be considered in the experimental stage.

Tourist travel continues to increase and, during the summer of 1939, all ships supplying Alaska carried capacity loads. The need for added transportation facilities is becoming more apparent each year, and as rapidly as new ships and hotel accommodations are provided, a continued increase in travel may be expected. A hotel accommodating approximately 200 persons, has been constructed by the Alaska railroad at the entrance of Mt. McKinley National Park, and was opened for business at the beginning of the 1939 summer season. It is hoped within the next year to extend this development by construction of a lodge and cottage within the park, at the end of the 90-mile highway which leads from McKinley Park station to Wonder lake, where a magnificent view of Mt. McKinley and neighbouring peaks may be secured. (E. GRU.)

Albania. Area 10,632 sq. mi.; pop. (est. Dec. 1937) 1,038,000; chief towns: Tirana (30,806); Scutari (29,206); Elbasan (13,796). Lieut.-General: F. Jacomoni di San Savino; language: Albanian; religion: Mohammedan.

History.—January 1939 saw Albania enjoying her 27th year of

independence but tension with Italy developed and in March demands were made which King Zog could not accept as consistent with national sovereignty. They included the use of the ports by Italy for military purposes.

In spite of previous disclaimers of aggressive intentions, on Good Friday, April 7 (three days after the birth of King Zog's heir, Prince Skender), Italian forces landed at the four principal ports. Resistance was offered but owing to lack of cohesion it was serious only at Durres. King Zog fled with some supporters. The shrewd Albanian population soon accepted the dictates of a force which it could not hope successfully to oppose. A provisional government was formed from Italophile elements, the existing constitution was abrogated by a hastily improvised national assembly and the throne offered to King Victor Emmanuel. The Italian Government explained its invasion as necessary to "restore order" and "to free the friendly Albanian people from a tyrannical clique."

Signor Jacomoni, previously minister at Tirana, was appointed lieutenant-general, or viceroy. By the new constitution, promulgated on June 4, Albania remains a nominally independent kingdom under the Crown of Italy.

Parliament was replaced by a Fascist High Corporative Council; an Albanian fascist party was formed; the army and gendarmerie were reduced to a shadow and a fascist militia created. It is claimed that a program of public works, chiefly road building, has found work for all.

It is too early to assess the historical significance of this incursion by Italy into Balkan territory. The effect on Yugoslavia was to intensify her neutrality when the European war clouds broke in September.

The immediate anxiety aroused in Greece was subsequently eased by diplomatic action. (D. R. O. H.)

LOWERING TROOPS from an Italian liner at Santi Quaranta, near Durazzo, during the occupation of Albania April 7-9, 1939

Banking and Finance.—Revenue and expenditure (est. April 1, 1939) to June 30, 1940=15 months, each 40,000,000 gold francs.

Trade.—Overseas trade (merchandise) 1938: imports, 22,979,890 gold francs; exports 9,749,959 gold francs.

Agriculture.—Production 1938 (in metric tons): wheat 44,910; maize 155,345; oats 11,256; barley 4,975; also vineyards, olive oil, livestock, fuel oil, bitumen, and fruits. (See also BALKAN ENTENTE; ITALY: History.)

Alberta, the most westerly of the prairie provinces of Canada, Alberta was created a province by Act of the Dominion Parliament, Sept. 1, 1905. The province has a total area of 255,285 sq.mi. and a population of 789,000 (estimate, Dominion Bureau of Statistics, 1939). The seat of government is Edmonton.

History.—The Social Credit Government, under the leadership of William Aberhart, was elected to office Sept. 3, 1935. Since that time all attempts to put the proposed Social Credit plan into effect have been unsuccessful. The Provincial Government has now (Jan. 1940) applied to the Dominion Government for a charter to set up a province-wide branch banking system through which it hopes to initiate the scheme. In the meantime, the premier has announced his intention of appealing to the electorate early in 1940.

Finance.—Since the first default of April 1937 the Government has continued to refuse to meet its obligations in respect to matured bond debts. The total bonded debt of Alberta is \$127,999,260.

Economic.—Although more diversified than its neighbour province of Saskatchewan, Alberta relies largely on its grain crops. The year 1939 was slightly better than 1938.

The wheat crop for the year 1939 was 150,000,000bu. as compared with 143,000,000 in 1938. Other grain crops were, in bushels, oats, 82,000,000 (101,000,000, 1938), barley, 27,000,000 (29,200,000, 1938), rye, 2,400,000 (2,700,000, 1938), and flaxseed 340,000 (250,000, 1938). The aggregate farm capital of the province, which includes land, buildings, implements, and livestock is estimated as of 1938 at \$676,614,000.

Other main sources of income were from minerals \$28,966,272, from manufacturing \$86,225,069 and from the fisheries \$492,943 for 1938. From statistics available for 1939 it appears these figures will be surpassed for the year.

Petroleum.—At the end of the year 1939 there were 100 oil wells in operation in the Turner Valley as compared with 65 at the end of 1938.

As a result of this development the production of crude petroleum reached an all-time high of 6,603,374bbl. for the ten months ended October 31, although the production was pro-rated by the Petroleum and Natural Gas Conservation Board among the producing wells so as not to overload the refineries or glut the available market.

The Royal Commission, set up in 1938 to investigate the whole of the oil industry, and to report on the advisability of the Government taking over the wholesale and retail distribution of all petroleum products produced in Alberta, did not up to Jan. 1, 1940 make its report public. (J. T. C.)

Alfalfa. The crop of alfalfa hay in the United States in 1939 was estimated by the Department of Agriculture October 1 as 27,139,000 tons, or 6% less than the 1938 crop of

28,858,000 tons, and 13% above the 10-year average.

Production of Alfalfa Hay by States, 1938 and 1939

Alimentary System, Disorders of. *The Oesophagus.* —In six of the seven cases reported by Chamberlain, either a congenitally short oesophagus, or diaphragmatic hernia, or both, were present. The numerous references to hiatus or diaphragmatic hernia in the current literature attest its frequency as well as the necessity of excluding this condition as the cause of otherwise unexplainable gastric, oesophageal, or cardiac disturbances, especially in middle-aged, obese individuals. The observations of Adams and his co-workers not only denote that there is continued interest in the surgical treatment of oesophageal carcinoma, but that a standardized procedure may ultimately be evolved for the successful treatment of what now is generally regarded as an inoperable condition.

The Stomach and Duodenum.—Following an extensive study of gastric carcinoma, Robertson and Judd concluded that this disease develops in a previously damaged stomach, especially as the result of ulcerative gastritis. In their opinion the pathogenesis of carcinoma is directly associated with a disorganized hyperplasia of the mucous cells. Modern concepts stress the importance of the effect of lesions of the brain, alterations in incretory or hormonal activity and the psyche mediated through the autonomic nervous system in the genesis of gastroduodenal ulcer.

Significant contributions to the all important subject of early gastric carcinoma have been made by Comfort and Butch, MacCarty, and Schindler. Gutmann and his associates are the authors of a volume dealing exclusively with the disease in its early stages. MacCarty reports observations on 128 relatively small cancers, 2.5cm. in diameter or smaller, and emphasizes the point that there were no pathognomonic symptoms or signs of cancer. It is evident that the recognition of cancer in its earlier stages can be and is being made with increasing frequency. Klein and Palmer minimize the menace of carcinomatous transformation of a benign ulcer. Investigations relative to the physiologic factors regulating gastric acidity and gastric motor activity, to the development of improved gastric test meals, and to a better understanding of the important pathways of conduction of pain from, and the mechanism of production of pain in the viscera of the upper part of the abdomen, are of particular interest because of their diagnostic and therapeutic implications. In this respect the contributions of Hollander, Wilhelmj, Apperly, Shay, Rivers, Jones, and their collaborators, are noteworthy.

Accumulating experience attests the indispensability of gastro-

scopy as a routine diagnostic procedure and it bids fair to soon enjoy the same prominence in English-speaking countries as it has on the European continent for the past decade or longer. To the clinician with a wealth of material at his disposal it is evident that chronic gastritis in its various forms is a common disorder, frequently giving rise to symptoms indistinguishable from the more familiar gross lesions. Gastroscopy also serves many other important functions. Colour photography of selected sites of the gastric wall has been successfully developed by Henning and Keilhack.

Nonsystemic antacids, such as magnesium trisilicate, tertiary calcium and magnesium phosphates, and colloidal aluminium gel, are gradually replacing the absorbable antacids in order that alkalosis, rebound secretion, and other undesirable reactions may be avoided. The constant drip apparatus is becoming increasingly popular.

The Biliary Tract and Pancreas.—Treatment of the deficiency of prothrombin in jaundiced states as well as in various intestinal disorders with antihaemorrhagic vitamin K represents a brilliant therapeutic triumph. Two milligrams of the new synthetic preparation of 2-methyl-1,4-naphthoquinone given intravenously, or orally with the addition of bile salts, will promptly correct abnormally low levels of prothrombin from whatever cause. The results of six years of research with respect to pancreatic function by means of the secretin test and special double-lumen tube, has been reported by Lagerlöf. Through the medium of a special double-lumen tube and continuous separate aspirations of gastric and duodenal secretion and saliva, using a brand of secretin freed of cholecystokinin and histamine as a stimulus, a promising clinical test for pancreatic function has been developed. Conclusions are based on the volume of pancreatic juice recovered, its bicarbonate content, and its enzymes. Among the last the diastase possesses the highest functional significance. The present procedure of choice in acute cholecystitis is immediate operation; that of acute pancreatitis, on the contrary, is nonsurgical. Elman, Gray, and their co-workers, describe transient or non-haemorrhagic types of acute pancreatitis and point out the importance of blood amylase studies in diagnosis. Berg reports other features such as hypochloroemia, electrocardiographic changes, and roentgenologic phenomena characterized by fan or band-like shadows in the region of the hylus of one or both lungs.

The Intestines.—Miller, Abbott, Shay, and their associates, confirm the usefulness of intubation in the study of isolated intestinal segments under physiologic conditions as well as conservative decompression in simple obstruction and in determining the presence and site of lesions of the small bowel which may require surgical intervention. Verzá's theory of absorption from the intestines is apparently supported by the results of the galactose absorption test of Althausen. This shows that intestinal absorption may be increased by certain diseases, such as hyperthyroidism and Paget's disease, and decreased by myxedema, Addison's disease, and vitamin deficiency states. Weber has shown that improved technique and increased experience makes possible the more frequent recognition not only of neoplasms but such non-neoplastic processes in the small bowel as tuberculosis, regional enteritis, diverticulae, and changes produced by deficiency states. Otherwise unexplainable diarrhoea, bleeding, or persistent abdominal pain are important indications for roentgenologic examination of the small bowel. Newer remedies include the use of atabrin for giardiasis, didoquin in amoebiasis, oxygen inhalation for gaseous distension, and neoprontosil for chronic ulcerative colitis in its earlier stages. (See also VITAMINS.)

All-American Canal: see AQUEDUCTS.

Allergy. While studies of the blood constituents in hay fever (Bruger and co-workers), a much more promising field indicating a possible disturbance in electrolyte and water metabolism is suggested by the work of Cook and Stoesser.

Among the recently described causes for allergic symptoms are the following: sugar beet pollen causing hay fever (Dutton); pine pollen, previously considered innocuous, causing asthma (Rowe); limonene in celery causing dermatitis in 30% of celery workers (Henry); karaya gum causing hives (Bowen); citrus fruit causing thrombopenic purpura (Dutton); wood smoke, acting not as an irritant, but as a specific cause of asthma (Rappaport and Hecht).

Continuous search for means to relieve chronic asthma has yielded new and valuable measures.

The modification of epinephrine solution to delay its absorption after injection into the tissues produces relief for as long as 24 hours instead of the two to four hours with the ordinary solution. This is accomplished by incorporating the drug in oil (Keeney and co-workers) or in gelatin (Spain and co-workers). A simplified mask for helium administration is described by Maytum for intractable attacks of asthma.

Reviewing the effect of X-ray treatment of a large number of asthma patients, Maytum and Leddy conclude that partial to complete but temporary relief occurs in half of the group. The treatment should be limited to those who fail to respond to other methods.

In hay fever intranasal spraying with gradually increasing concentrations of pollen solutions is reported to increase resistance against pollen (Francis). Oral administration of pollen was found ineffective (Zeller).

Alloys: see MAGNESIUM; MOLYBDENUM; MONAZITE; NICKEL; TITANIUM; VANADIUM; CHEMISTRY, APPLIED.

Almonds: see NUTS.

Aluminium or Aluminum. The most important developments of recent years in connection with aluminium all centre around the problem of meeting the larger demand as the metal has been adopted for a rapidly growing list of new uses, resulting in the opening up of new ore deposits (see BAUXITE), the expansion of output by old producers, and the establishment of considerable new production. There have been marked increases in the outputs of Germany and Italy, and six new countries have been added to the producer's list:

Spain in 1929, the Soviet Union in 1932, Japan and Sweden in 1934, Hungary in 1935, and Yugoslavia in 1937.

World production in 1938 totalled 562,000 metric tons, distributed as follows:

Germany 165,600 tons; United States 130,000; Canada 55,000; U.S.S.R. 44,000; France 43,000; Switzerland 28,000; Norway 28,000; Italy 25,800; Great Britain 24,000; Japan 13,000; Sweden 1,800; Hungary 1,500; Yugoslavia 1,300; and Spain 800 tons.

The 1938 total was 17% higher than that for 1937, and 1939 is expected to show another increase.

Germany again leads in the 1938 output with 30% of the total, and a 30% increase over 1937, while the United States dropped 2%.

New uses continue to expand, most of which depend on the lightness, strength, and corrosion resistance of the metal or its alloys, with cable for electrical transmission and transportation equipment especially active.

Sales in the United States in 1939 are reported to have made a new high record.

(See also CRYOLITE; METALLURGY.)

American Academy of Arts and Letters

and Letters was organized in 1904 by the National Institute of Arts and Letters, a body which was organized in 1898 by the American Social Science Association. From Nov. 1938 to May 1939 an exhibition of the Works of Charles Adams Platt, a member of the Academy who died in 1933, was held in its art gallery. This was followed by an exhibition of Childe Hassam, a member of the Academy who died in 1935; at the same time an exhibition was open in the administration building of paintings of Edwin Austin Abbey, a member of the Academy whose death occurred in 1911. These paintings were lent by Yale University. There is one vacancy in the Academy caused by the death of Sidney Coe Howard. The officers elected in 1938 are: Nicholas Murray Butler, president; Wilbur L. Cross, chancellor and treasurer; William Lyon Phelps, secretary. The other six directors elected were: Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, Charles Downer Hazen, and Archer Milton Huntington. (G. D. V.)

American Academy of Arts and Sciences.

The Academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: I, Mathematical and Physical Sciences; II, Natural and Physical Sciences; III, The Social Arts; IV, The Humanities. The officers for the year 1939-40 are: president, Harlow Shapley; corresponding secretary, Leigh Hoadley; recording secretary, Hudson Hoagland; treasurer, Horace S. Ford. The following papers were presented at regular monthly meetings: George H. Parker, "Modern Views on the Action of the Nervous System"; George Sarton, "The Function of Academies, Past and Present"; Hudson Hoagland, "Some Aspects of Electrical Brain Waves"; Dr. A. Forbes, "Aerial Photography and Map-making"; C. M. Spofford, "Contributions on

the Development of Bridges"; S. Foster Damon, "The Fatigue of Burgwine"; L. J. Henderson, C. C. Brinton, E. B. Wilson—Symposium: "What Constitutes Social Progress?"; A. Krogh, "Programs of Instruction on Physiology."

The following papers were read by title, and will appear presently in the *Proceedings*: "Chang Po-Tuan: Essay on the Understanding of Truth." T. L. Davis and Chao Yün-Ts'ung; "Gyro-magnetic Ratios for Ferromagnetic Substances, New Determinations." S. J. Barnett; "Some Physical Constants of a Few Hydrocarbons and their Structural Isomers." M. Wojciechowski; "Interatomic Forces and Helium in Rocks." N. B. Keevil; "Sera-phidae in Baltic Amber," C. T. Brues; "Fossil Parasitic Hymenoptera of the Family of Calliceratidae in Baltic Amber," C. T. Brues. Grants in aid of research were made from the Rumford Fund, the C. M. Warren Fund, and from the Permanent Science Fund; 32 awards amounting to \$10,250. (A. P. U.)

American Academy of Political and Social Science

continued during 1939 the activities which it has carried on throughout its fifty years of history. Through publications and through meetings it devotes its attention to the discussion of questions of national and world importance. Its annual meeting for 1939 was held on March 31 and April 1 and was the 43rd of such meetings. The subject for the two-day discussion was "Democracy and the Americas." During the fall of 1939 evening sessions were held as follows: on October 14, "American Foreign Policy"; on November 18, "The Roots of Totalitarianism." A luncheon meeting was held also on December 11 on the subject, "America Faces South."

The *Annals*, which is the bi-monthly journal of the Academy and which devotes each issue to a symposium on a designated topic, published its six regular issues during 1939. The titles were: Ownership and Regulation of Public Utilities (January); Appraising the Social Security Program (March); Refugees (May); Democracy and the Americas (July); Frontiers of Legal Aid Work (September); Government Expansion in the Economic Sphere (November). During the year there appeared the third of the monograph series published by the Academy. The title is "The Turkey of Atatürk" and the author is Donald E. Webster.

American Association of University Professors: see ACADEMIC FREEDOM; UNIVERSITIES AND COLLEGES.

American Bankers Association.

Membership in the American Bankers Association in 1938-39 under the administration of Philip A. Benson, president of The Dime Savings Bank of Brooklyn, New York, reached the greatest percentage since records of the organization have been kept, with approximately 80%, or 13,747 of the banks in the United States belonging.

A new and hitherto unexplored field of banking research was entered by the association in 1939. Studies of the actual volume and number of loans made by banks in various States were undertaken and figures showing the extent to which banks actively serve the credit requirements of their communities were made public. In addition, a compilation was made of specified amounts of credit available at all times to established regular business borrowers.

Officers of the association elected at the annual convention at Seattle, Wash., Sept. 25-28, 1939, for the ensuing year are: president, Robert M. Hanes, Winston-Salem, N. C.; first vice-president, P. D. Houston, Nashville, Tenn.; second vice-president, Henry W. Koeneke, Ponca City, Okla.; treasurer, B. Murray Peyton, Duluth, Minn.; executive manager, Dr. Harold Stonier, New York,

N.Y.; senior deputy manager, Frank W. Simmonds, New York, N.Y.; secretary, Richard W. Hill, New York, N.Y.; national bank division, president, Melvin Rouff, Houston, Texas; vice-president, Andrew Price, Seattle, Wash.; trust division, president, Roland E. Clark, vice-president, Carl W. Fenninger, Philadelphia, Pa.; State bank division, president, William S. Elliott, Canton, Ga.; vice-president, Harry A. Bryant, Parsons, Kan.; savings division, president, A. George Gilman, Malden, Mass.; vice-president, Roy A. Marquardt, Chicago, Ill.; State secretaries section, president, C. C. Wattam, Fargo, N.D.; first vice-president, L. F. Scarboro, Denver, Colo.; second vice-president, Armitt H. Coate, Moorestown, N.J. (L. G.N.)

American Bar Association.

The Civil Rights Committee, under the chairmanship of Grenville Clark, filed a brief as *amicus curiae* in the suit against Mayor Hague and officials of Jersey City, N.J., to enjoin denial of right to distribute printed matter and arbitrary refusal of permits for public meetings. The decision of the U.S. Supreme Court, June 5, 1939, sustained injunction decreed by District Court. *Hague, et al v. C.I.O.*, 307 U.S. 496. The Logan-Walter bill, pending in Congress, was drafted by the Administrative Law Committee, headed by Chairman O. R. McGuire. It would require Federal administrative agencies to formulate rules of civil procedure and provides a uniform method for judicial review of their decisions, with the intent of canalizing administrative discretion within statutory limitations. The committee on Labour, Employment and Social Security, under the chairmanship of William L. Ransom, submitted a detailed study of Federal legislation in its field with recommendations for amendments. Awards: annual Medal of the Association to Major Edgar B. Tolman, editor-in-chief of the *A.B.A. Journal*, for his contributions to law reform; Ross Essay Prize of \$3,000 to Professor Malcolm McDermott of Duke University Law School; Awards of Merit to State Bar of South Dakota and Bar Association of Dallas. Elected at July 1939 meeting: Charles A. Beardsley, president; Thomas B. Gay, chairman of the House of Delegates; Harry S. Knight, secretary; John H. Voorhees, treasurer; Joseph D. Stecher, assistant secretary. (M. D.N.)

American Chemical Society.

The society operates under a National Charter from the 75th Congress. In 1939, the presidency passed from Dean F. C. Whitmore of the Pennsylvania State college to Dr. C. A. Kraus of Brown university, with Dean S. C. Lind of the University of Minnesota as president-elect. He became president Jan. 1, 1940. National meetings in Baltimore and Boston showed attendances of 4,024 and 3,924 with 499 and 547 scientific papers, respectively. The 92 local sections were more active than ever. The awards of the society: to Leroy S. Palmer, the Borden award in the Chemistry of Milk; to George Wald, the Eli Lilly and Company award in Biological Chemistry; to George Hubbard Clapp, the Pittsburgh award; to Raleigh Gilchrist and Edward Wickers, the Hillebrand award; to Joel H. Hildebrand, the Nichols medal; to Charles F. Vaughn, the Schoellkopf medal; to Donald Dexter van Slyke, the Willard Gibbs medal. Membership passed 23,000. (C. L. Ps.)

American Citizens Abroad.

The following is an estimate of the number of American citizens living abroad, as of Jan. 1, 1939, compiled from reports received from American consulates in all parts of the world. This estimate includes only those whose residence abroad has a permanent or semi-permanent character and therefore excludes tourists and all others whose sojourn abroad was considered

to be only transitory. Attention is called to the fact that in spite of the care exercised by consuls in preparing their reports, it was impossible in many cases for them to obtain exact figures as to the number of Americans residing in their respective districts. Nevertheless, this estimate, based on all available sources of information, may be regarded as a fairly accurate world census of Americans living abroad.

meetings were held in 1939 in Nashville, Tenn.; Baltimore, Md.; Indianapolis, Ind.; and Winnipeg, Man. The 29th Annual Clinical Congress and the 22nd Annual Hospital Standardization Conference, attended by 3,000 surgeons and 1,500 hospital executives, were conducted by the College in Oct. 1939, in Philadelphia, U.S.A. (M. T. M.)

American Council on Education: see EDUCATION.

American Dental Association: see DENTISTRY.

American Economic Association. The purpose of the American Economic Association (founded in 1885) is to encourage economic research, issue publications on economic subjects, and stimulate thought and discussion of current problems from an economic point of view. The articles appearing in the association's quarterly publication, the *American Economic Review*, and the papers included in the *Proceedings* of the 52nd Annual Meeting, held in Philadelphia, Dec. 1939, fairly reflect the character of problems currently treated by economists and are indicative of the progress of economic thought of the year.

Officers for the year 1940 are: president, Frederick C. Mills, Columbia university; vice-presidents, James W. Angell, Columbia university; Calvin B. Hoover, Duke university; secretary-treasurer, James Washington Bell, Northwestern university; elected members of the executive committee, Benjamin M. Anderson, Jr., University of California at Los Angeles; Mabel Newcomer, Vassar college; Paul T. Homan, Cornell university; Ray B. Westerfield, Yale university; J. Douglas Brown, Princeton university; George W. Stocking, University of Texas.

Membership, as listed in the handbook of the association, numbering approximately 3,000 (an additional 1,300 libraries and other subscribers are not included), constitutes a veritable "who's who" of American economists.

American Ethnology, Bureau of: see SMITHSONIAN INSTITUTION.

American College of Surgeons, founded in 1913 by 500 surgeons of the United States and Canada, under the leadership of the late Dr. Franklin H. Martin, to insure a standard of professional, ethical, and moral requirements for every graduate in medicine who practices general surgery or any of its specialties. Fellowship, 1940: 12,793. Chairman, board of regents, Dr. Irvin Abell, Louisville, Ky.; president, 1939-40, Dr. George P. Muller, Philadelphia, Pa.; president-elect, Dr. Everts A. Graham, St. Louis, Mo.; secretary, Dr. Frederic A. Besley, Waukegan, Ill.; associate director and chairman, administrative board, Dr. Malcolm T. MacEachern, Chicago, Ill.; associate director, Dr. Bowman C. Crowell, Chicago, Ill.; assistant directors, Dr. E. W. Williamson and Dr. Harold Earnhart, Chicago, Ill. The organization originated Hospital Standardization Movement, 1918, formulating minimum standards for approval and starting periodic surveys; 2,720 hospitals in United States, Canada, and other countries are on 1939 approved list; 307 cancer clinics in hospitals were approved in 1939; and 933 medical services in industry were approved in 1939. An approved list of medical motion picture films is also issued yearly. The college maintains a medical library and literary research department. The committee on graduate training for surgery (general surgery and the surgical specialties) was organized in 1937. Committees on cancer, archives of cancer, bone sarcoma, fractures and other traumas, and the Hall of the Art and Science of Surgery, function through a department of clinical research. Sectional

American Federation of Labor was formed at a convention in Columbus, Ohio, in 1881 by a small group of craft union leaders headed by Samuel Gompers, English-born cigarmaker. Gompers was elected president and was re-elected each year except 1893 until he died in 1924.

The American Federation of Labor in 1920 reported a dues-paying membership of 4,078,740. In 1933 its membership dropped to 2,126,796. On Aug. 31, 1939, the Federation consisted of 105 national and international unions; 1,568 local labour unions in the U.S. and Canada; 49 State federations; and 806 city central bodies, with a membership of 4,006,354. It lost a membership of approximately 1,000,000 in 1936 when it suspended the Committee for Industrial Organization unions, but during the following years the Federation redoubled its organization efforts and regained in new members the C.I.O. loss. The president of the American Federation of Labor is William Green, a former coal miner and former official of the United Mine Workers of America. He was elected president Dec. 19, 1924.

The Federation has a threefold purpose: (1) to organize unorganized workers; (2) to promote the interests of its members through legislative activity and publicity; and (3) to settle disputes among its members. The Federation's annual autumn convention is its final seat of authority. Between conventions the Federation is governed by an executive council made up of the president, secretary-treasurer, and fifteen vice-presidents. It is financed by a per capita tax on member unions, two cents each month for

U. S. LABOUR was a modern Gulliver in 1939, according to Fitzpatrick of *The St. Louis Post-Dispatch*

each member of national and international unions and 35 cents a month for each member of directly affiliated local unions. The financial report of the Federation beginning Sept. 1, 1938, and ending Aug. 31, 1939, showed that the balance on hand, Aug. 31, 1938, was \$443,631.19; the total receipts for the twelve months ending Aug. 31, 1939, were \$1,800,249.70 and the total expenses for the same period were \$1,697,376.53, leaving a balance on hand Aug. 31, 1939, of \$546,504.36. (See also CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES: History.) (L. STA.)

American Federation of Teachers: see EDUCATION: *Institutes on Professional Relations*.

American Geographical Society. Two expeditions involving mountaineering and aerial photography for mapping purposes were carried out under the sponsorship of the American Geographical Society in 1939. On the Cabot Colombian Expedition extensive field studies in geology and physiography were made in the Sierra de Santa Marta in northern Colombia, the highest peak (18,770ft.) climbed, and the Sierra mapped by aerial photography. On the Third Wood Yukon Expedition the ground-control work of the two previous expeditions of 1935 and 1937 was linked and further aerial photography carried out. Topographic maps will be constructed from the aerial photographs taken on these expeditions by a special method of mapping from high-oblique photographs developed at the society. Awards of the society's gold medals for 1939 were: the Cullum Geographical medal to Emmanuel de Martonne, professor of geography at the University of Paris and president of the International Geographical Union; the Charles P. Daly medal to Herbert J. Fleure, professor of geography at the University of Manchester; and the David Livingstone Centenary medal to John P. Rymill, leader of the British Graham Land Expedition of 1935-37.

The society's publications during 1939 included an addition to its Special Publications series of monographs entitled "White Settlers in the Tropics" (a study of the possibilities of permanent settlement by white men in the tropics, by A. Grenfell Price, an Australian geographer and master of St. Mark's college, University of Adelaide) and a series of maps of Europe on a single sheet designed for reference purposes and for use in following present military operations in Europe, entitled "Environment and Conflict in Europe: Eighteen Basic Maps."

The periodical publications of the society, the *Geographical Review*, its quarterly journal, and *Current Geographical Publications*, a classified list, issued monthly except for July and August, in mimeographed form, of the titles, with the usual catalogue information, of books, articles, and maps selected for inclusion in the society's Research Catalogue, were continued during the year. (R. R. P.)

American Historical Association was incorporated by act of Congress in 1889 "for the promotion of historical studies . . . and for kindred purposes in the interests of American history and of history in America." It had (Jan. 1, 1940), a membership of about 3,500, chiefly recruited from the teachers and writers of history in American and Canadian schools and colleges. Its national headquarters are at 740 15th Street, N.W., Washington, D.C., but its chief administrative officer, the executive secretary, has offices at 226 South 16th street, Philadelphia, Pennsylvania. It is governed by a Council elected at the annual meeting and supported by annual dues (\$5) and by the income of an endowment fund of about \$250,000.

Its officers for the year 1940 are: president, Max Farrand, Huntington library; first vice-president, James Westfall Thompson, professor emeritus of the University of California; second vice-president, Arthur M. Schlesinger, Harvard university; treasurer, Solon J. Buck, the National Archives; executive secretary, Conyers Read, University of Pennsylvania.

During the year 1939 it continued the publication of *The American Historical Review*, the leading historical journal in America, and participated in the publication of *Social Education*, devoted to the problem of teaching the social studies in the school. It also published in 1939 *The Course of the South to Secession*, by Ulrich B. Phillips, edited by E. Merton Coulter; *James Kent, A Study in Conservatism*, by John T. Horton; *John Tyler, Champion of the Old South*, by O. P. Chitwood; *Writings on American History* for the year 1935; and *Proceedings* for 1937; the two latter printed by the United States Government. (C. Rd.)

American Indians: see INDIANS, AMERICAN.

American Law Institute. Since its organization, the chief work of the American Law Institute has been a *Restatement of the Law*, best described as an orderly statement of the present common law. While the sections into which the Restatement is divided are written in statutory form, they are not presented to legislatures for adoption. The object of the Restatement is to clarify and simplify the common law, but not to prevent its continued development by judicial decision. Prior to 1939, 13 volumes of the Restatement were published, including the Law of Contracts, Conflict of Laws, Agency, Trusts, and Restitution, besides large portions of the Law of Property and Torts. During the year, the fourth and final volume on Torts has been completed and published, while work on the Restatement of Property and Security has been continued. In 1939 two other projects of importance have been begun—the drafting of a model Code of Evidence and a statute or statutes dealing with

the administration of the criminal law in so far as it affects youths between 16 and 21 convicted of crime.

Part of this last work, relating to a treatment board to which such convicted youths will be sentenced, has been completed by the editorial staff, approved by the Council and is ready for submission to a meeting of the Institute.

The American Law Institute was organized in Feb. 1923. Its object is to carry on constructive scientific work for the improvement of the law. Aside from the official members, who are those holding the leading judicial, bar, and law school faculty positions, there are 719 life members; membership being a distinct professional honour. The governing body is a Council of 33. The members meet each year in Washington, D.C. All legal and other official publications of the Institute must be first approved by the Council and by a meeting of members. The president is George Wharton Pepper; William Draper Lewis is director and chief of the editorial staff. The executive office is at 3400 Chestnut street, Philadelphia, Pennsylvania. (W. D. L.)

American Legion. In 1939 the militant program to "pre-serve America for Americans" witnessed a record-breaking progress toward the Legion's 20-year objective of an adequate national defence, a wide extension of Americanism, youth-training activities, and strong support for the Dies Congressional Committee investigating subversive activities, and successful pressure to bring about the deportation trial of Harry Bridges, West Coast alien agitator; child welfare, with the long-range program, continued seeking liberalized benefits for needy children in the State social security programs, while the immediate program again was devoted to extending emergency financial aid from Legion and other sources amounting to

ANN SHERIDAN, movie actress, was a welcome "mascot" Sept. 26, 1939, at the American Legion's convention in Chicago

\$3,757,865.27 for 442,489 needy children; a rehabilitation program recovered grants totalling \$3,338,857.50 in contested benefits for disabled veterans and their dependents; membership for the third consecutive year was the second best in the history of the American Legion and its four affiliated organizations.

The 21st annual national convention was attended by 250,000 members and their families in Chicago, Sept. 25 to 28, 1939.

From resolutions adopted by the Chicago convention, the national executive committee, at Indianapolis, November 23 and 24, selected the following major national legislative program:

(1) Government protection of World War widows and orphans, (2) an adequate national defence, (3) continued advocacy of universal service legislation as a measure to promote defence and deprofitize war, (4) effective veterans' preference in all Government jobs, (5) further tightening of immigration, naturalization, and deportation laws.

The 1,405 official delegates, representing 58 continental and outlying departments, and six posts not attached to any department, named Raymond J. Kelly, Detroit, Mich., corporation counsel to succeed Stephen F. Chadwick, Seattle, Wash., as national commander, and chose Boston, Mass., as the 1940 convention city.

National headquarters of the American Legion, and of its affiliated organizations, the American Legion Auxiliary, the Forty and Eight, and the Sons of the American Legion, remained at the War Memorial building, Indianapolis. The Eight and Forty has headquarters elsewhere in Indianapolis. Frank E. Samuel, national adjutant, and principal administrative officer of the American Legion, was re-elected by the national executive committee at its November meeting in Indianapolis.

(R. J. K.)

American Library Association, the official organization of librarians in the United States and Canada, consists of librarians, library trustees, and others interested in libraries. Founded in 1876, it functions through a headquarters staff of over 65 persons and through 75 voluntary boards and committees. International in character from its beginning, the association had representatives from every major country in its 1939 membership which numbered over 15,000.

The oldest and largest association of its kind, it is affiliated, formally or informally, with more than fifty other library associations in America and abroad.

One of the chief objectives of the association is complete and adequate library coverage for the United States and Canada. In 1939 approximately 42,000,000 people in the United States—92% of them in rural areas—were without access to a public library. Other objectives are: "to assist libraries to operate with the utmost economy and efficiency; to improve the status of librarianship; to build for the future of library service by drawing into the profession some of the best qualified young men and women; and to promote studies which will tend to establish on a solid foundation the library's place in the governmental and social structure."

Standards of training for librarians are set by the association and a free employment service is offered to libraries and individual librarians. The total income for the fiscal year was about \$350,000. The association's endowment is (Jan. 1, 1940) approximately \$2,179,000.

The association issues four periodicals: *A.L.A. Bulletin*, a monthly which includes the annual reports, the conference proceedings, and the yearly handbook; the *Booklist*, published semi-monthly as a guide to the selection and purchase of current books; the *Subscription Books Bulletin*, a quarterly which presents critical estimates of subscription books and sets sold currently by canvassing agents and the *Journal of Documentary Reproduction*, a

quarterly. In addition, the association published 28 other professional books and pamphlets during the year, a few outstanding titles including *American Librarianship from a European Angle*, by Wilhelm Munthe; *Personnel Administration in Public Libraries*, by Clara W. Herbert; *Helping Adults to Learn*, edited by John Chancellor; *Helping the Reader toward Self-Education*, by Chancellor, Tompkins, and Medway; *Books for Self-Education*, by Sigrid Edge; *College and University Library Service*, by A. F. Kuhlman; and *Vitalizing a College Library*, by B. Lamar Johnson.

During the association's 61st annual conference, held in San Francisco, June 18-24, and attended by approximately 3,000 persons, four awards were made. The Joseph W. Lippincott award was presented to Herbert Putnam, former librarian of Congress, for the most outstanding contribution to librarianship last year; the James Terry White medal, to Louis Round Wilson, dean of the Graduate Library School of the University of Chicago for his *Geography of Reading*; the Caldecott medal, to Thomas Handforth for his illustrations in *Mei Li*, cited as the most distinguished American picture book for children published in 1938; and the Newbery medal, to Elizabeth Enright, for her *Thimble Summer*, considered the most distinguished contribution to children's literature published during 1938. Dr. John H. Finley, editor emeritus of *The New York Times* was made an honorary member of the association. The 1940 conference will be held in Cincinnati, Ohio, May 26-June 1.

Among library developments of the year for which the A.L.A. worked were Federal aid for libraries, embodied in the Harrison-Thomas bill introduced in both Houses during the 76th Congress but not acted upon at the first session; State and provincial aid, granted in small amounts for public libraries in British Columbia, Nova Scotia, Arkansas, Ohio, and Vermont; more effective library co-operation between the libraries of North America and Latin America, A.L.A. efforts being furthered by a grant of \$30,000 from the Rockefeller Foundation; and closer sympathy and understanding between European and American peoples, through gifts of books to a selected group of popular libraries in Europe, the gifts being made possible by a \$60,000 Rockefeller Foundation grant. The A.L.A. issued three important official pronouncements during the year; the revised *National Plan for Libraries*, the new *Code of Ethics*, and the *Library's Bill of Rights*. The A.L.A. Council also adopted *Classification and Pay Plans for Municipal Public Libraries*, prepared by the A.L.A. Board on Salaries, Staff, and Tenure. A generous grant from the Rockefeller Foundation has assured completion of the new edition of the *Union List of Serials*.

The association was represented at the International Library Committee meeting at The Hague and at Amsterdam in July 1939, by Harrison W. Craver and J. Periam Danton; at the International Conference on Documentation in Zurich in August by Vernon Tate and Arthur B. Berthold; and at the meeting of the Library Association of Great Britain in Liverpool in June by Gerhard R. Lomer and Charles R. Sanderson.

Ralph Munn, Pittsburgh, Pa., is the association's 1939-40 president. Carl H. Milam is executive secretary of the A.L.A. headquarters, located at 520 North Michigan avenue, Chicago. (See also LIBRARIES.) (B. S. RL.)

American Literature. In 1939, both fiction and non-fiction held steadily to the principal discernible trend of the past few years, namely, an interest in the nation's past. Historical novels dominated the scene, and the great figures of other years, Lincoln, Thoreau, Marshall and Taney, Hamilton, and Emerson provided subject matter for the outstanding biographies or collections of letters.

The trend was further strengthened by numerous historical

volumes, designed to make their readers familiar with the ideals of the earlier days of the Republic. Because of the outbreak of the war in Europe there were also many books on international affairs, and fresh treatment of the relation of the United States to the conflict between democratic and totalitarian ideals raging abroad.

The most popular and at the same time controversial novel of the twelvemonth was John Steinbeck's *The Grapes of Wrath*, a dramatic and arousing treatment of the problem of migratory workers seeking their fortunes in California after their eviction from the Oklahoma dust-bowl. Coming close on the heels of the success of Mr. Steinbeck's novelette, *Of Mice and Men*, the novel was bound to attract critical attention and was hailed by the majority of reviewers as a major work. Californians denied the truth of the presentation, and the quarrel inevitably attracted more readers. The same problem was treated by Carey McWilliams in a non-fiction study, *Factories in the Fields*, which seemed to bear out Mr. Steinbeck's conclusions of serious social injustices in the Salinas valley.

Reviewers less impressed by Mr. Steinbeck's proletarian sympathies and by his unquestioned skill as a writer of fiction, found artistic flaws in *The Grapes of Wrath* and were unwilling to concede it a place among the nation's masterpieces, the principal criticism being aimed at the ending of the book, which appeared to leave the questions raised without a specific solution. Others found Mr. Steinbeck's Biblical and prophetic passages hollow rather than masterful, but the novel swept the country and was widely read even by people who were offended at the frankness of its language.

Its popularity, coming at the end of the so-called proletarian movement in the nation's fiction, which was dying even before the Hitler-Stalin pact, was a tribute to the growing reputation of its author, and to his ability to make appealing figures of his characters. The bold prophecy that it would prove the *Uncle Tom's Cabin* of the times seemed hardly to be justified as the year ended, with the story on its way to the screen by way of Hollywood, but there is no doubt that it did arouse wide interest in a local problem, and widespread sympathy with one section of the underprivileged, although specific action did not seem to follow the wave of emotion caused by the book.

While no other novel of the year equalled the Steinbeck opus in sales, Christopher Morley's story of a working-girl, *Kitty Foyle*, appeared to be a serious rival as the year ended, and was obviously destined to be the most popular work of fiction of this prolific writer. In contrast to the proletarian material of Mr. Steinbeck, Mr. Morley went to the great middle-classes for his study of a typical American girl, and with great warmth and sympathy, presented her as a young person of character, facing her problems with courage and good sense.

Among books of non-fiction, none received such high praise as Carl Sandburg's continuation of his monumental life of Abraham Lincoln, *The War Years*, a four-volume work which was universally praised as a folk-story of first importance, in addition to being an important section of what promised to be the definitive study of a great man. Henry Seidel Canby's *Thoreau* was also widely hailed as the kind of biography the Sage of Concord had long deserved, and like the Sandburg *Lincoln*, a book with its abundance of lessons for present-day Americans, a ripely scholarly achievement.

The most popular book of non-fiction of the year, however, illustrated once more the depth and strength of this country's interest in its small-town past. It was Bellamy Partridge's *Country Lawyer*, the story of the author's father's career in a little up-state New York town. Mr. Partridge had been long known as editor, reviewer, and author of light-fiction, but was to find his

notable success in dealing with intimate family material, which he handled with humour and sympathy, and which obviously touched the hearts of a great public.

The year in poetry found no conspicuously successful volume and brought forth no especially promising new voices. Edna St. Vincent Millay's *Huntsman, What Quarry?*, did little to enhance its author's standing, especially following so close upon *Conversation at Midnight*, regarded askance by most reviewers. Robert P. Tristram Coffin's *Collected Poems* helped to establish Mr. Coffin's place as the voice of conventional New England, while a similar volume of William Carlos Williams formed an interesting contrast because of its originality, often bordering upon obscurity. Less was heard from the Left Wing, although Archibald MacLeish, Muriel Rukeyser, and others continued their appeals in verse for a greater measure of social justice and a curbing of the evils which they regarded as besetting the existing American system.

Novels.—Aside from the popular successes of Messrs. Steinbeck and Morley, the most solid accomplishment in the field of historical fiction was Elizabeth Page's *Tree of Liberty*, a long novel dealing with the early days of the nation, using characters from life with freedom and impressive skill, and telling a story with its full significance for our own times. The work of five years of research, Miss Page's book scored not only by its authenticity and its wide-ranging knowledge, but by the novelist's ability to make her people live and to fill her pages with exciting incidents.

Other historical novels of importance included Chard Powers Smith's *Artillery of Time*, another long book about a New York State family, marred by some artistic faults, but covering successfully a wide span of time, and well enough written to be easily and pleasurably read; Vardis Fisher's *Children of God*, a saga of the Mormons, and the most extensive fiction treatment of this curious chapter in U.S. history; Francis Griswold's *Sea Island Lady*, a story of a Northern woman in South Carolina during the days of the Civil War and after, by the author of *The Tides of Malvern*; and Bruce Lancaster's *Guns of Burgoyne*, the last mentioned one of a number of novels dealing with the Revolutionary period. Others in the group were Frank O. Hough's thoughtfully realistic story of Westchester county, *If Not Victory*; John Jennings's *Next to Valour*; Leland D. Baldwin's *The Delectable Country*, a novel of Ohio in the late years of the 18th century, and one of the best of its kind; and Mary Schumann's *Strife Before Dawn*, which dealt with Pontiac's War, 1764-1782.

Clifford Dowdey went to Colonial Virginia for his *Gamble's Hundred*, a romance with social connotations, the struggle between the great planters and the small farmers; Clyde Brion Davis dropped his familiar subject of the pathos of small lives and wrote a vigorous and entertaining frontier story, *Nebraska Coast*, and Holmes Alexander went back to the early days of West Virginia for his *American Nabob*, less successful as a novel than as a document.

Well-known novelists working inside and outside the historical field who appeared on the year's lists included James Boyd, whose *Bitter Creek* was one of his lesser works because of its resemblance to the conventional "Western," in spite of the unfailing talent of its author for good fiction; John P. Marquand, whose *Wickford Point* was the delightfully told story of a decadent and amusing New England family, and one of the year's most popular novels; William Faulkner, whose *Wild Palms* was an only partly successful attempt to fuse symbolically two separate stories, one of which described a convict's struggles during a Mississippi river flood with striking success, while the other, a conventional tale of passion, failed to come off; and John Dos Passos, whose *Adventures of a Young Man* was its author's confession of his failure to find perfection among the Left Wing saviours of mankind, at best

After a portrait by Bo Beskov

JOHN STEINBECK, author of *The Grapes of Wrath*

one of his minor productions. Pearl S. Buck returned to the East for the material of her *The Patriot*, a timely story of Japan and China, and wrote one of her best books after the lamentable failure of *This Proud Heart*, and Frederic Prokosch proved his right to a place among the best of the younger novelists with his *Night of the Poor*, his first novel of the American scene.

The loss to our literature in the death of Thomas Wolfe was brought freshly to mind by the publication of the first of his posthumous works, *The Web and the Rock*, which proved to be of a piece with his scattered and confused earlier novels, but which illustrated again his great powers of poetry and characterization, hardly equalled in his time. Another novel, *You Can't Go Home Again* is to follow, before the final contribution of this distinguished figure can be assayed; there was also published during the year *The Face of the Nation*, poetical passages from Wolfe's earlier works, which strengthened his claim to a place beside Walt Whitman in his feeling for America and his ability to express his rhapsodies in prose often of great power and beauty, and often, unfortunately, hollowly rhetorical.

Among the better novels by newcomers were Augusta Tucker's *Miss Susie Slagle's*, a fine human story of a spinster in Baltimore and her relations with Johns Hopkins medical students; Robert Penn Warren's powerful tale of the tobacco wars in Kentucky, *Night Rider*; Kenneth Fearing's *Hospital*, the first venture into fiction by a good poet; Elizabeth Marion's *The Day Will Come*, a remarkably mature study in family relationships by a young woman of only 22 years; and Beatrice Kelly Harris's *Purslane*, a story of every-day middle class North Carolinians with a distinctly native flavour, which found large numbers of readers.

Biography.—In addition to the Sandburg *Lincoln*, the outstanding biography of the year, and to Dr. Canby's *Thoreau*, Henry F. Pringle wrote a detailed and sympathetic account of

The Life and Times of William Howard Taft; John Bakeless a readable and accurate study of *Daniel Boone*, and David Loth again studied *Alexander Hamilton*, his sub-title being "The Portrait of a Prodigy." In verse, Robin Lamson told of the achievements of Gorgas, in *Death Closes a Pair of Wings*, while three biographies of living Americans of high quality were Alfred Lief's *Democracy's Norris*, Rixie Smith and Norman Beasley's *Carter Glass*, and George Soule's *Sidney Hillman: Labor Statesman*. Some lesser known Americans who found portraitists during the year included William Henry Harrison, treated in *Old Tippecanoe* by Freeman Cleaves; John Tyler, described by Oliver Perry Chitwood as *John Tyler, Champion of the Old South*, and James Kent, the Federalist Chancellor of New York State, famous for his *Commentaries*, whose life by John Theodore Horton is titled *James Kent, A Study in Conservatism, 1763-1847*.

Other notable biographies which either broke new ground in their approach to well-known figures or re-assayed their subjects were Alphonse B. Miller's *Thaddeus Stevens*, a fair and complete study of the man responsible for Reconstruction; Allan Nevins's *Fremont: Pathfinder of the West*, and *Marshall and Taney* by Ben W. Palmer, notable for its re-evaluation of Taney, and giving in detail the profound effect these two famous jurists had on shaping the Constitution.

A number of autobiographies of lasting importance appeared during the year, the most popular of them William Lyon Phelps's *Autobiography With Letters*, a long and leisurely book filled with the genial quality that has made its author one of the most loved of all the living bookmen; Ida M. Tarbell's *All in the Day's Work*, the reminiscences of an octogenarian journalist still as alert and vigorous as ever; Daniel Beard's *Hardly a Man is Still Alive*, the life-story of the great Boy Scout leader and naturalist; Hutchins Hapgood's *A Victorian in the Modern World*, Flora Finch Kelly's *The Flowing Stream*, Edna Ferber's *A Peculiar Treasure*, Louis Untermeyer's and Leonard Bacon's *Semi-Centennial: Some of the Life and Part of the Opinions of Leonard Bacon*, controversial, intelligent, and highly readable comment on many matters, also *Art Young, His Life and Times*, edited by John Nicholas Beffel, with many of this beloved artist's own illustrations.

The year also saw the publication of Ralph Waldo Emerson's letters in a handsome four-volume edition, edited by Ralph Leslie Rusk, and of Gouverneur Morris's *A Diary of the French Revolution*, which under the careful editing of Beatrix Cary Davenport became one of the most widely read of Revolutionary documents, throwing new light upon a controversial figure from his own materials. Volume I of Josephus Daniels's *A Tar Heel Editor* was an important contribution to Americana, as well as an engaging picture of a man of our own times, and Edith Bolling Wilson's *My Memoir* gave an intimate picture of Woodrow Wilson from the point of view of his second wife, filled with feminine frankness on many matters and on many prominent men and women in public life.

History.—Two of the most distinguished historians of the day collaborated on *The Heritage of America*, Henry Steele Commager and Allan Nevins, a collection of original documents making plain what America is about. An excellent piece of editorial selection, it was as readable as significant and a permanent contribution to the subject. Marjorie Barstow Greenbie wrote a companion volume of value, *American Saga: The History and Literature of the American Dream of a Better Life*, and in *The Living Tradition: Change and America*, Simeon Strunsky surveyed the whole American story with common sense, balance, and humour, finding that there had been far less of change than most people imagined. Foreign-born himself, but illustrating many of the best native virtues, Mr. Strunsky's picture is one to reassure the frightened and to put heart into those who still believe that the U. S. is a good coun-

try in which the free and the well-meaning may live and flourish. It is a long book, 260,000 words, but a most readable and optimistic one. Another event of importance in the field of history was the publication of a 50th anniversary edition of James Bryce's *American Commonwealth*, edited by Robert C. Brooks, and containing a number of noted reviews, such as those of Woodrow Wilson and Lord Acton.

Gerald Johnson's *America's Silver Age* was a lively study of the statesmanship of the Clay-Webster period, and Burton J. Hendrick's *Statesmen of the Lost Cause*, the first detailed study of the men with whom Jefferson Davis surrounded himself as President of the Confederacy. Mr. Hendrick had very little opinion of the Davis aides, but acknowledged the difficulties under which the Southern leader laboured in trying to please the States that made up his loosely organized Government. Captain W. D. Puleston's *Mahan* was a full length biography of the American naval officer whose theory of sea-power has influenced the course of world events, and formed an interesting companion volume to Harold and Margaret Sprout's *The Rise of American Naval Power*, both timely volumes in connection with the prevailing international situation. Tyler Bennett's *Lincoln and the Civil War* was received as a contribution to the Lincoln story of lasting value, and the third volume of Charles A. and Mary Beard's *America in Mid-Passage* was the most important study of recent times in the United States, although not up to the quality of the first two monumental volumes. In their effort to cover the literature of the period, the Beards proved themselves often inaccurate, and their insistence upon measuring fiction by its social content alone weakened what was a significant treatment of recent times, from a Left liberal point of view. Samuel Hopkins Adams retold the Harding story in *Incredible Era*, omitting none of its amazing details. Gustavus Myers added a last chapter to his classic, *The History of Great American Fortunes* with *The Ending of American Hereditary Fortunes*.

The perpetual fascination of the frontier was exhibited in many books dealing with old days in the West, some of the best of them being Stanley Vestal's *The Old Santa Fe Trail*; Paul Wellman's *The Trampling Herd*; Thomas D. Clark's *The Rampaging Frontier; We Pointed Them North: The Record of a Cowpuncher*, by E. C. Abbott (Teddy Blue) and Helena Huntington Smith, and *The Lion of the Vigilantes and the Life of Old San Francisco* by James A. B. Scherer. In *The Changing West*, William Allen White, beloved editor of the Emporia (Kansas) *Gazette*, gave a realistic and human picture of his part of the country, which while altogether honest, was hopeful. Covering the entire country and devoting ample space, of course, to the West, Edwin F. Embree, in his *Indians of the Americas* wrote of the 20,000 years of the aborigines who preceded white civilization on two continents.

A book of observations of contemporary life in America that seemed to be of more than passing value was Rollo Walter Brown's *I Travel by Train*, friendly and discerning observations of an itinerant college professor. Other volumes bearing upon current problems were Raymond Moley's *After Seven Years*, a frank criticism of the New Deal from the inside; Ralph L. Woods's *America Reborn: A Plan for Decentralization*; Felix Frankfurter's *Law and Politics*; the *Occasional Papers from 1913 to 1918*, edited by Archibald MacLeish and E. F. Prichard, with a foreword by Mr. MacLeish; and Josephine Baker's *Fighting for Life*, the whole story of the battle for child welfare in the U. S., told by one of the principal participants.

In the field of art, several notable books appeared, among the best of them James Flexner's *America's Old Masters*, which told the story of the lives and works of West, Copley, Peale, and Stuart. William Shack's *And He Sat Among the Ashes* gave a full account of the struggles of Louis Eilshemius, an eccentric genius who

Urgel. Its chief products are oats, barley, vines, tobacco, sheep, iron and lead. A good road provides a link with Spain.

Area, 191 sq.mi.; pop. 5,230; capital town, Andorra le Vieja; language, Catalan; religion, Christian (Roman Catholic); imports from United Kingdom: (1936) £1,000; (1937) £63; (1938) £28; currency: French and Spanish legal tender.

Angling. The outstanding catch of the 1939 salt-water season was a new world's record blue marlin which was caught by Mrs. Mary Sears at Cat Cay in the Bahamas. Her giant marlin, caught on June 6, weighed 730 pounds. This exceeded the former blue marlin record, held by Thomas Shevlin, by almost 100 pounds.

The giant bluefin tuna world's record was broken twice in 1939. An 868-lb. record-breaker was caught by J. Frank Johnson on August 30 at Liverpool, Nova Scotia. Less than a month later, on September 24, this record was broken by an 890-lb. bluefin tuna caught at Yarmouth, Nova Scotia. The latter fish, which holds the present world's record, was caught by John Manning of Los Angeles, California.

Many of the giant sharks are getting more and more recognition by the leading salt-water fishermen. Australia, which seems to afford some of the very best shark fishing, produced two new world's records during the 1939 season. One of these was a 1,382-lb. tiger shark caught by Lyle Bagnard at Sydney Head, Australia. The other was a 1,384-lb. white shark landed by G. R. Cowell at Port Lincoln, Australia. Mr. Cowell exceeded his own white shark record by almost 100 lb., and at the same time established a record for the largest fish ever taken on rod and reel.

Only one new world's record was established in the fresh-water fishing field in 1939, but the old record was broken twice. A 59½-lb. muskellunge caught in July in Wisconsin set a new record, but this was surpassed on October 3 when a 60-pounder was caught by John J. Coleman at Eagle River, Ontario. This is the largest strictly fresh-water game fish ever caught in America.

Another outstanding catch was a 55-lb. Atlantic salmon landed by Esmond B. Martin in the Grand Cascapedia of Quebec. While this does not establish a new world's record it is a much larger salmon than has been landed in North America for some time.

As far as big fish are concerned, there was one other incident of considerable concern to fresh-water fishermen. This was a 36¾-lb. brown trout found in the Logan river in Utah. Although this trout was not caught on rod and reel, it is of interest because it shows the enormous size to which these fish may grow. The largest brown trout ever before reported in North America weighed 25¼ lb., lighter by more than 10 lb. than this latest Logan river monster.

(D. Ho.)

Anglo-Egyptian Sudan. Area 967,500 sq. mi.; pop. (est. 1938) 5,719,819. Chief towns: (pop. 1938) Khartoum (46,676); Omdurman (110,959); Port Sudan (21,773); Atbara (19,757); El Obeid (27,390). Governor-general: Lt.-Col. Sir Stewart Symes; languages: English and Arabic; religion: Mohammedan.

History.—In contrast to 1938 the Nile flood in 1939 was abnormally low and river cultivation below Khartoum suffered in consequence. Sufficient late rain fell, however, to ensure a good grain crop throughout the country. Locusts arrived in force early in the season but were attacked by disease and discouraged by drought and did little damage. The outbreak of war resulted in some disorganization of trade and prices rose immediately. Emergency legislation coupled with the resumption of more normal shipping services quickly checked this.

Through a network of supervisory public health officials spread over this vast country, anti-mosquito work has been intensified

and propaganda disseminated to improve housing, nutrition, water-supplies, and public health in all its aspects. Public security remained satisfactory throughout the year.

Education.—Intermediate schools 11, scholars 1,573; higher: secondary schools 465, post-secondary schools 73.

Banking and Finance.—In 1938: revenue £7,574,000; expenditure £7,293,000; public debt (Dec. 31, 1938) £13,873,800.

Trade and Communication.—In 1938: imports £E6,283,000; exports £E5,490,000. Communications: roads, suitable for motor traffic, all weather c. 1,000mi.; railways 1,991mi.; river service 2,325mi.; motor vehicles licensed (1937) 4,354 cars, commercial vehicles and cycles; telephone subscribers (1937) 2,383.

Agriculture and Mineral Production.—Production: (in metric tons) cotton seed (1938-39) 105,000; ginned cotton (1938-39) 60,000; millet (1937-38) 315,000; sesamum (1937-38) 33,000; maize (1937-38) 10,000; wheat (1937-38) 8,000; ground-nuts (1937-38) 8,500; gold (1938) 252 kilograms.

Anthropology, the science of man in terms of his physique, his language, and most importantly his culture, is steadily differentiating into a series of separate disciplines, as the treatment of each of its aspects becomes more complex. In the past, much attention was given to discussions of the inter-relationships and virtual independence of language, race, and culture (F. Boas, *Race, Language, and Culture*, 1939). The emphasis now is shifting to broadening the relationships between the study of each of these separate branches and other related sciences; to increasing the ties between Primitive Linguistics and the Science of Language and Psychology; between Physical Anthropology and Endocrinology, with greater recognition of the social repercussions of physical processes such as growth and senescence. Cultural Anthropology is increasing its relationships with Psychology, Sociology, and Economics.

SKULL OF A NEANDERTHAL CHILD discovered in July 1939, in Uzbekistan, U.S.S.R., by Dr. A. P. Okladnikov, young Soviet archaeologist. Dr. Ales Hrdlicka of the Smithsonian Institution, who was in Russia at the time, described this discovery as one of the utmost importance to anthropology

There has been a steady decrease in funds available for research, especially in long-time grants from the big foundations, and there is also a continued drift away from the support that was once given to ethnological and archaeological work by private collectors. Hence, archaeology is coming to look more to Government support. In the South American countries there is a general trend to combine an interest in antiquities with national promotion programs; in the United States, both the Federal Government and an increasing number of State and inter-State archaeological associations have recently engaged in work of professional quality. Archaeology is also coming to depend upon an interest in primitive arts (G. C. Vaillant, *Indian Arts in North America*, 1939), an interest which was stimulated by the exhibits at the Golden Gate International Exposition, San Francisco, 1939. Aside from the regular Federal agencies for ethnological research (Smithsonian Institution and Bureau of American Ethnology), there has been no extensive utilization of students of culture by Government agencies, either in dealing with Indian tribes or in solving the problems of racial and cultural minorities.

Physical anthropology, once confined almost entirely to the study of racial types, is tending to combine with human biology, placing increasing emphasis on studies of growth (Brush Foundation, Cleveland, Ohio, Grant Study of the Normal Man at Harvard; see also F. K. Shuttleworth, "The Physical and Mental Growth of Girls and Boys Age Six to Nineteen in Relation to Age at Maximum Growth," *Child Development Monographs* vol. 4, no. 3, 1939) and the relationship between the organism and the milieu (H. L. Shapiro, *Migration and Environment*, 1939). The application of endocrinological findings to human problems with social and psychological significance finds expression in a number of studies (M. F. Ashley-Montagu, "Adolescent Sterility," *Quarterly Review of Biology*, vol. 14, nos. 1 and 2, 1939; *Problems of Aging*, edited by E. V. Cowdry, 1939). Work in blood groups is continuing (see P. N. Candela, "Blood Group Tests on Stains, Mummified Tissues and Cancellous Bones," *Amer. J. Physical Anthropol.* 25:187-214). A third *Pithecanthropus* specimen was found ("Discovery of an Additional *Pithecanthropus* Skull," *Nature*, October 15, Communication from G. H. R. von Koenigswald and F. Weidenreich), and also a new Neanderthal specimen in Central Asia by A. Okladnikov and his wife (note by A. Hrdlicka, *Science*, Sept. 29, 1939).

In North American archaeology, of special note was the discussion on the antiquity of man in America at the Sixth Pacific Science Congress (California, July 24-Aug. 12, 1939); the finds of "women's knives" in association with Indian artefacts characteristic of the region (J. H. Bailey, "A Ground Slate Producing Site Near Vergennes, Vermont," *Bull. Champlain Valley Archaeological Society*, vol. 1, no. 2, 1939); and the find by F. H. Roberts of small beads in the Lindenmeier site in association with the Folsom culture.

In Central American archaeology, the most conspicuous find was the discovery of the earliest known Mayan date at Tres Zapotes. The long-time archaeological projects under the American Museum of Natural History, the Carnegie Institution, the National Geographic Institute, and Tulane university are continuing.

In the study of culture, man's non-biological inheritance, there are several marked, but not necessarily incompatible trends: (1) the continuation of the historical method, best exemplified by the American school and at present by the work of the University of California, in which emphasis is upon the establishment of sequences, the examination of problems of change and diffusion by a series of comparative studies of related cultures, and in which the unit of discussion is the trait, with a certain growing tendency to introduce quantitative methods (Kroeber, Kluckhohn.

THE MOST PERFECTLY PRESERVED Neanderthal skull yet discovered was found in 1939 on Monte Circeo, near Rome

Lowie); (2) the examination of social processes, in which it is possible to distinguish several methods of approach—(a) that which is concerned with the way in which individual psychological processes become embodied in cultural forms, are shaped by cultural forms, and provide the dynamics for social equilibrium and social change (Bateson, Benedict, Mead); (b) that which is concerned with the study of society within which the individual acts in terms of socially defined roles and the unit of study is either the individual as a member of the group, or the group (Radcliffe-Brown, Linton, Warner); (c) that which primarily attacks cultural processes diachronically in terms of widely distributed groups of common origin or different levels of social integration (Herskovits, Redfield); (d) that which analyzes societies in terms of the functioning of institutions assumed to be comparable from society to society because they meet the same needs (Malinowski, Firth). These various methods of approach are of uneven age and are defective in that they employ field techniques which permit students unevenly trained or gifted to assemble usable materials. In this respect the approach to culture as an expression of individual psychology and its effect upon moulding the growing personality has been least happy, but recent emphasis upon the development of various techniques such as the use of the life history (W. Dyke, *Son of Old Man Hat*, 1938), of projective methods (David Levy, "Sibling Rivalry Studies in Children of Primitive Groups," *Amer. J. Ortho-Psychiatry*, vol. 9, no. 1, p. 205, Jan. 1939), extensive use of Cine and still photographic recording of behaviour (Bateson and Mead: "Research in Bali," *N.Y. Aca. Sciences, Trans.* Ser. 2, vol. 2, no. 1, Nov. 1939), and the use of the methods of experimental psychology (S. F. Nadel, *Experiments on Culture Psychology, Africa*, 1937) is doing much to remedy this defect. (See also *The Study of Society*, London, 1939.)

There is evidence of increased cross fertilization, both in methods and in concepts, between the study of culture and other social sciences. Of especial interest are: the attempt of Kardiner, in co-operation with Linton, to re-examine and refine upon psychoanalytical concepts by testing them out upon material from

primitive cultures (A. Kardiner, *The Individual and His Society*, 1939); Erikson's efforts, in co-operation with McKeel, to make a psychoanalytic approach to Sioux education (E. J. Erikson, "Observations on Sioux Education," *J. Gen. Psychology*, 7:101-156); Lynd's suggestion that the various discrete social sciences use the concept of culture as a way of defining a common field of material upon which their various techniques could be brought to bear co-operatively in the solution of selected problems (R. S. Lynd, *Knowledge for What*, 1939); and the co-operative attempt of a group of social scientists at the Institute of Human Relations, Yale, to develop a hypothesis and test it out on a variety of materials, one of which was the records of a primitive culture (*Frustration and Aggression*, 1939).

The most significant development in linguistics took place in Mexico, where the Department of National Education and the National Polytechnical Institute initiated a project for the study of native dialects under the direction of M. Swadesh, which combines the most sophisticated linguistic techniques with application to practical educational problems approached from the phonemic point of view.

The outbreak of the war has made it impossible to get full reports from abroad. In the totalitarian countries research continues to be centred upon questions in which controversial issues will not be raised—on archaeology and linguistics in the U.S.S.R., and on various apologias of the current political theories of race in Germany.

In the U.S.S.R. archaeological research is part of a comprehensive program of exploring sites from Palaeolithic times down to the feudal antecedents of modern Russia. This extensive and expanding program is combined with the preparation of very complete treatises on the ethnography and dialects of the various peoples of the U.S.S.R.

In England, institutional anthropology, in the form of association meetings and publications, are continuing, but anthropological research, which had already been suffering from curtailment of funds and from the rapid westernization of primitive peoples available for study, will, because of the war, undoubtedly suffer further drastic interruption, not only in field work but also in the very type of research into cultural processes which is so essential to our knowledge of how to control human institutions so as to prevent war.

Antimony. World production of antimony is estimated at 30,000 metric tons in 1938, against 37,000 tons in 1937. Decreases of 48% in China and 25% in Mexico were only partly offset by increases of 32% in Bolivia and 90% in Yugo-

slavia. Formerly China supplied about 70% of the demand, Mexico 10%, and Bolivia 7%, the remaining 13% being scattered among 20 or more minor producers, but in 1938 China supplied only 26%, Bolivia 29%, Mexico 25%, and Yugoslavia 4%. The United States has no regular ore production, but several hundred tons annually are recovered as a by-product in the smelting of lead, and since 1931 an antimony smelter has been in operation in Texas, using imported ores. The output of this smelter exceeded 4,900 metric tons in 1937, and has been responsible for a considerable increase in the ore outputs of Mexico, Bolivia, and Peru with a corresponding decrease in the imports of ore and metal from China. The United States is the largest consumer of antimony, taking about one-half of the world supply of new metal to satisfy two-thirds of its consumption demand, the other third being furnished by secondary metal recovered after previous use. The Chinese industry has been badly disorganized by the Sino-Japanese conflict, and though smelting operations continued, shipments during 1938 were much reduced. Total exports declined 48% to 7,797 metric tons in 1938. (G. A. Ro.)

Anti-Saloon League of America, Inc. A non-partisan, interdenominational temperance organization formed in 1895. It is a federated movement, the National Board of Directors being elected by the Boards of the State Leagues. The governing bodies of the State Leagues are elected or appointed from the co-operating religious denominations and civic groups. The work in the States is in charge of State superintendents elected by the State Leagues, of which there were 37 in 1939. A co-operating relationship was maintained with committees or temperance units in the other States. During the current year the league has worked to carry out the policies outlined by its National Board of Directors at its biennial meeting at Columbus, Ohio, in Dec. 1938.

The league opposed before the State legislatures, most of which met during the year, enlarged privileges for the liquor traffic; favoured restriction in hours of sale, number of licences, and the prohibition of their issuance in rural and inadequately policed territory or in the vicinity of schools; sought local option legislation where it was denied, and in other ways favoured legislation to diminish progressively the sale and consumption of alcoholic beverages. The league advocated legislation before the 76th Congress to prohibit the advertising of alcoholic beverages in interstate commerce, and amendments to the Liquor Law Enforcement Act of 1936 to effectively protect the States against the importation of liquor for use or delivery in violation of State law. In the Senate a bill to prohibit the advertising of alcoholic beverages over the radio was reported favourably by the Committee on Interstate Commerce. The national headquarters are at 131 B street S.E., Washington, D.C. (E. B. Du.)

Anti-Semitism. The violent anti-Semitism which had reached its culmination in Germany in the events of Nov. 1938 and in the ensuing legislation aiming at the complete dispossession and extermination of the Jews in Germany, continued in 1939. Through Germany's conquests of Czechoslovakia and Poland the spirit and measures of National Socialist anti-Semitism were spread to these two countries. The number of Jews in countries directly affected by the National Socialist legislation may be estimated at about 4,000,000. By a tragic irony National Socialism which had wished to eliminate all Jews from Germany brought by its subsequent conquests of Austria, Czechoslovakia and Poland many more Jews under its control than there had ever been in Germany. This paradoxical situation forced National Socialism into ever more ferocious and ruthless

measures against the Jews. Ultimately, in the fall of 1939, the National Socialists proposed the creation of a Jewish "reservation" in south-eastern Poland near Lublin where, according to original plans, all the millions of Jews from Germany, Austria, Czechoslovakia, and Poland were to be concentrated on a small and overcrowded space, being sent there without money or sufficient clothing, and exposed to starvation and inhuman treatment. By the end of 1939 a beginning with the transfer of Jews to this reservation had been made. The fate of the Jews in Poland, after the conquest of the country by National Socialist Germany, surpassed in the treatment meted out to the Jews even the worst events and measures in Nazi Germany herself.

Fascist Italy started to imitate on July 14, 1938, the anti-Semitic policy of National Socialist Germany. Since then anti-Semitism has become as dominant an institution in Italian legislation as it is in Germany. The expression of anti-Semitism in the Italian press reaches the same depth of vulgarity as in the German press. A special periodical, called *La Difesa della Raza*, was created for this purpose. Italy's definition of race, was, however, less stringent than the German one. A law of Feb. 9, 1939, forbade Jews to own land with a combined taxable value of more than 5,000 lire or urban buildings of a combined taxable value of more than 20,000 lire. Jewish enterprises with more than 100 employees were expropriated. A decree on June 1, 1939, forbade any collaboration between Jewish and non-Jewish lawyers, physicians or dentists, Jewish members of the professions being allowed to attend only to Jewish clients. All foreign Jews had to leave Italy within six months. Civic equality for the Jews had been the last remnant of the liberal tradition of Fascist Italy; the Fascist alliance with National Socialist Germany resulted in the complete co-ordination of Italian with German policy.

In Rumania anti-Semitism continued, without, however, giving during 1939 rise to any new special legislation. In Hungary, the anti-Jewish laws went into effect on Oct. 1, 1939. In their racial definition as well as in the number of exemptions this Hungarian law is very much milder than the corresponding German legislation. Under certain conditions Jews retained the suffrage and the right to be elected to national and municipal legislative bodies. Jews were to be excluded from public offices, the civil service and the teaching profession, and to be restricted in the other liberal professions to not more than 6% of the total number of persons engaged in the profession, and to 12% in other economic pursuits. The Hungarian Government suppressed, however, all attempts on the part of Hungarian National Socialists to start violent anti-Semitism according to the German model. One of the results of the National Socialist attitude towards the Poles and Czechs, whom they treated similarly to the Jews as "inferior" races, and against whom they applied discriminating legislation and humiliating treatment, was the growth of greater sympathy on the part of the Czechs and the Poles for the Jews. It became clear that the anti-Jewish legislation had been only the entering wedge for a similar treatment of other races once they were put into a similar helpless position as the Jews were.

The year 1939 saw also a definite increase in anti-Semitic agitation in the United States. Among the most active in this respect were various groups organized as "Christian Front" and "Christian Mobilizers." This anti-Semitic propaganda was most actively supported by the National Socialists who liked to arouse the opinion that the responsibility for the gathering war clouds in Europe and later for the war was not to be attributed to National Socialist aggressiveness, but to "Jewish war mongers." Father Coughlin used to denounce in his weekly broadcasts in the first part of the year all anti-National Socialists as war mongers and to praise National Socialism as a reaction to and as a defence against Communism. The unexpected conclusion of an alliance

of National Socialism with Communism has created a momentary difficulty for anti-Semitic propaganda in America, as the beloved identification of "Jews" and "Moscow" and the praise of anti-Semitic National Socialism as a bulwark against both could not be maintained any longer. Anti-Semites had to drop their previous rationalizations, and try a number of new ones without, however, being able to agree yet upon a definite line. The "revelations" of Major General George Van Horn Moseley before the Dies Committee for the investigation of un-American activities clearly showed the length to which anti-Semitic prejudice can go. Apples. Heavier war-risk shipping charges and scarcity of cargo space, as well as import restrictions disrupted the market in the United Kingdom and Europe for United States and Canadian apples. As a result, an appreciable part of the U.S. crop was left unharvested because of low prices, while in Canada the Government came to the relief of growers by proposing to purchase 1,500,000bbl., and possibly 1,750,000bbl., of the Nova Scotia crop, estimated at 2,169,000bbl., such purchases to be processed. It was also proposed that the Government buy 500,000 boxes of British Columbia and 150,000bbl. of Ontario apples. The 1939 crop in Canada was reported as 5,135,000bbl., as against 5,222,400bbl. in 1938. The November 1 estimate of the Department of Agriculture placed the 1939 United States commercial crop at 100,300,000bu., compared to 82,395,000bu. in 1938 and a ten-year average (1928-37) of 96,469,000 bushels. This 1939 estimate is for fresh consumption sales and allows for diversion by the Federal Government in purchases of fresh fruit for relief distribution. United States apple exports in Sept. 1939, were only about two fifths of Sept. 1938.

Aquariums. The aquarium situation has been relatively quiet throughout the year 1939. Much of this has been due to general unsettled world conditions.

With the outbreak of war in Europe in the latter part of the year, the consequent disruption of shipping has greatly hindered

STARTING POINT of the world's greatest aqueduct system, completed in 1939, is Parker dam on the Colorado river near Parker, Arizona. One billion gallons of water are carried daily 242mi. to Los Angeles and 12 other cities on the Pacific

long distance transportation of aquatic animals, even between regions not intimately connected with the war zones. Consequently, until adjustments are made it follows that aquaria generally must depend more on emphasizing the exhibition of less distant forms of life than during periods of free interchange and active commerce. Unlike zoological gardens, however, public aquaria in locations liable to attack by air feel no pressure to remove animals that might become dangerous to the general public. The physical limitations of aquatic forms of life, no matter how vicious in their own environment, preclude their becoming a public menace under war hazards. Before war conditions virtually shut off such commerce, the collections of many aquaria were enhanced by the importation of interesting innovations. For example, two species of the African family Mormyridae have found their way to America for the first time. These fishes, closely associated with Egyptian mythology, have been seen at times in European aquaria but never before in American institutions. The finding of a single specimen of a supposedly long extinct group of fishes, the Coelacanth, off the east coast of Africa, has generally excited the imaginations of aquarium administrators with high scientific hopes. The smallest tarpons on record have been displayed in New York, a matter of no small interest to anglers devoted to the pursuit of this species. (See also ZOOLOGY: *Specific Contributions*; for picture see MARINE BIOLOGY.) (C. M. BR.)

Aqueducts. The All-American canal, the largest irrigation ditch in the United States, being built by the Federal Bureau of Reclamation at an estimated cost of \$38,500,000, was virtually completed. It will carry water diverted from the Colorado river by Imperial dam for a distance of 80mi. into the Imperial valley, California. With the 130mi. Coachella Branch canal, which was started in 1938, water will be supplied ultimately for irrigating approximately 1,000,000ac. of land in southern California. The Colorado river aqueduct, now under construction by the Metropolitan Water District of Southern California, extends 242mi. from the river near Parker, Arizona, to Cajalco reservoir, 12mi. south of Riverside, California. On Jan. 7, 1939, the first water flowed into the aqueduct when the Intake pumping plant was placed in operation. With all major features completed, including 29 tunnels with a combined length of 92.1mi., the project, estimated to cost \$220,000,000, will deliver 1,000,000,000 gal. of water per day to Los Angeles and twelve neighbouring coastal cities. Work was in progress on the Delaware river aqueduct, an 85-mi. pressure tunnel, which will carry additional water supplies from the Catskill mountains to New York city. Extending from the proposed Roundout reservoir at Lackawack, New York, to

Hill View reservoir in Yonkers, the new project, estimated to cost \$273,000,000, will increase the city's water supply by 50%. Twenty-three of the 30 shafts required for the project were completed in 1939. To safeguard and improve Boston's water supply an 18-mi. pressure aqueduct, consisting mainly of a large size pre-cast concrete pipe, is being built from the Wachusett reservoir to the Boston metropolitan district. The 11.3-mi. Mono Craters tunnel, which will deliver an average additional 140 sec.-ft. of water from Mono Basin to the Los Angeles aqueduct to improve the water supply system of Los Angeles, was holed through in April 1939. An ingenious 47-mi.-long gravity system of mountain tunnels and giant pipelines has been built to provide San Francisco with a limitless supply of water and power from the O'Shaughnessy dam in Hetch-Hetchy valley, California. Construction began the latter part of 1938 with two tunnels on a 40-mi. aqueduct which will carry stored water from Deer Creek reservoir in Provo canyon over steep and irregular mountain slopes to Salt Lake City, Utah. (See also DAMS.) (J. C. PA.)

Arabia. Total area (estimated) 1,000,000 square miles. Total pop. (estimated, 1937) 9,300,000; Saudi Arabia, 4,500,000; Yemen 3,500,000; Oman and Muscat 500,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Ibn Sa'ud; Yemen, Imam Yahaya Muhammad Hamid ed Din; Oman and Muscat, Sultan Sayyid Said bin Taimur; Kuwait, Sheikh Ahmed Ibn Jabir al Subah.

History.—The year 1939 marked an important turning-point in the history of Arabia inasmuch as it became for the first time since pre-Islamic days a producer and exporter of minerals. In the mountainous western district of Hejaz gold has been discovered at various points and a promising mine has been developed at Mahad al Dhahab 100mi. south of Medina. By the end of the year some 600 tons of concentrates had been exported to America for refining. But, more important than gold, oil has been discovered in encouraging commercial quantities in the eastern districts of Arabia, notably at Kuwait and Dhahran. The latter field, or rather the pipe-line connecting it with the Persian gulf port of Ras Tanura, was opened in April and by the end of 1939 oil exports were being shipped to the tune of 20,000bbl. (3,000 tons) a day.

The production of oil and gold, meaning a steady revenue for the government of Saudi Arabia, comes at an opportune moment to augment the slender resources of the country which has hitherto been mainly dependent on a fluctuating pilgrimage to Mecca. During the depression of 1931 the number of pilgrims visiting the Hejaz fell from an average of 100,000 to 21,000. Since then there had been a steady recovery until in Jan. 1939, the figure had risen to 65,000. Unfortunately the shadow of war darkened the country's

prospects and the actual outbreak of war in September realized the worst fears of the pessimists. The number of pilgrims in Jan. 1940, will be below 25,000 and the consequent loss of revenue to the government as well as the effect on merchants and people may be left to the imagination. (H. St. J. B. P.)

Trade.—With India (1938-39): Oman and Muscat, imports £284,250; exports £153,750; other states of Arabia, imports £486,000; export £48,000. With the United Kingdom (1938): Saudi Arabia and Yemen, imports £94,960; exports £28,871; Oman and Muscat, Trucial Sheikhs and Kuwait, imports £40,262; exports £18,354. Total trade of Oman and Muscat (1937-38): imports £312,534; exports £247,426; Kuwait (1937-38): imports £410,812; exports £174,006.

Arbitration, International: see PERMANENT COURT OF INTERNATIONAL JUSTICE.

Arbós, E. Fernandez (1863-1939), Spanish conductor and violinist, was born in Madrid December 25 and received his early musical training at the Madrid conservatory. In 1883 he became concert-master of the Berlin Philharmonic orchestra, and thereafter made a notably successful tour of Europe as a violinist. In 1903 he was concert-master of the Boston Symphony orchestra, and later he was guest conductor of orchestras in France, Russia, England, and other countries. He was appointed conductor of the Madrid Symphony in 1908 and retained this position until his death. The best known of his compositions are a comic opera, *El Centro de la Tierra* (1895), the ballet *En Triana*, and his orchestral transcriptions of the works of Albeniz. His death at San Sebastian, Spain, was reported in London on June 10.

Archaeology. The outstanding event of 1939 in American archaeology was the 27th International Congress of Americanists, held in Mexico City, on August 5 to 15. In addition to the scientific sessions on various anthropological subjects, the program included numerous trips to the famous archaeological sites of the vicinity.

The year 1939 was marked by increased archaeological activity in the field, not only through further studies in well known areas, but also by additional investigations in areas which until recently received little attention. Additional light has been thrown upon the important problem of the antiquity of man in the New World. The Bureau of American Ethnology continued its work at the famous Lindenmeier site in northern Colorado. The study of the Oregon cave deposits was carried forward. Evidences of a Folsom culture and pleistocene deposits were found in a New Mexico cave by a University of New Mexico expedition. In the Great Lakes area, a field party from the University of Michigan encountered records of human occupation associated with post-glacial beaches, indicating considerable antiquity.

Well over half a hundred universities, museums, societies and research organizations sponsored field expeditions in all parts of the United States. Some of these were single season projects, others were parts of long term programs. Among the better known ones, the Awatovi (Arizona) Expedition of the Peabody museum of Harvard completed its fifth and final field season; the Tennessee Valley Authority's explorations of the Tennessee valley basins were continued; and the University of Chicago conducted its sixth season at the Kincaid site in southern Illinois. During the year a long term program was begun, when the Indiana Historical Society and Historical Bureau sponsored the first season's field work at the Angel Mounds site in southern Indiana.

Important discoveries were made in an ancient Eskimo village at Point Hope in Alaska by a joint expedition of the University

of Alaska and the National Museum of Denmark. A preliminary archaeological survey of the east coast of Hudson's Bay was made on behalf of the University of Chicago. During the summer the National Museum of Canada sponsored excavations of a woodland site in the Grand River valley, near Dunnville, Ontario.

Northern Mexico received additional attention in 1939. The American Museum of Natural History engaged in a reconnaissance and excavation project in northwestern Mexico. The Peabody museum of Harvard sent a reconnaissance party to the western part of the State of Coahuila. The University of California, in collaboration with the Instituto Nacional de Antropología e Historia, sponsored a surface survey of archaeological sites along the Pacific coast of Mexico.

In the Valley of Mexico and the southern part of the Republic, the Mexican Government continued its extensive and far-sighted program of excavation and restoration among the great ruins of the region. A joint expedition of the Departamento de Monumento of Mexico and the Carnegie Institution of Washington made field studies in the important Tuxtla region of Vera Cruz. Near the village of Tres Zapotes, in the same region, another expedition sent by the National Geographic Society and the Smithsonian Institution made some important discoveries, including a fragment of a stone monument bearing one of the earliest known dates in the Maya calendar.

The Carnegie Institution of Washington also continued its archaeological studies in the highlands of Guatemala and northern Honduras. The University of Pennsylvania museum prosecuted its eighth and final season at the ruins of Piedras Negras, Guatemala. A small party from the School of American Research excavated a site in southwestern Guatemala during the spring of the year. At the same time a representative of the Peabody museum of Harvard carried on some excavations on the island of Haiti.

Although detailed information on the archaeological activities in South America during 1939 is not at hand, it may be assumed that the research programs of governments and institutions in Argentina, Brazil, Bolivia, and Peru have been continued. An expedition from the Peabody museum of Harvard spent six months excavating at Pucara, Peru.

Within the United States the continued availability of Federal relief facilities (WPA), stimulated both field and laboratory work. Organizations with established archaeological programs found it possible to expand their activities, and a number of

AN IMPORTANT ARCHAEOLOGICAL DISCOVERY of 1939 was the tomb of one of the Sheshonks, Egyptian Pharaohs of the 22nd dynasty, opened in March at Sanel-Hagar on the Nile delta by Prof. Pierre Montet of Strasbourg

smaller societies were able, with the assistance of trained archaeologists, to undertake field and laboratory work with the aid of the WPA facilities. For some years there has been a growing interest in the application of archaeological methods to the study of documented and historic sites. During 1939, the sponsorship of such procedures by the National Park Service served to stimulate the study of these sites. One outstanding example is the investigation by Phillips Academy of Andover, Massachusetts of the remains of an old fish weir found some 40 feet below street level in Boston.

In the southwest, studies were made of the lesser known peripheral archaeological cultures and of detailed relationships within the better known groups, especially the Mogollon complex. Continued research in the northcentral States led to a clarification of many detailed cultural relationships. The most noticeable growth in knowledge occurred in the southeastern area, where many students devoted the year to determining the fundamental data upon which an outline of the cultural sequences in this area will ultimately be built. The work done in other regions of the United States, particularly on the Pacific coast, in the Great Plains, and in New England, added substantially to archaeological knowledge. The improvements in field methods, and the emphasis upon laboratory work, were reflected in the growing consideration given to problems of methodology, nomenclature, and classification of data. An increased appreciation developed of the interdependence of projects and problems, not only within archaeology, but also in relation to geology, geography, biology, physical anthropology, ethnology, and history.

Since the full interpretation of field materials can only be accomplished through laboratory work, the increase in the number of expeditions was paralleled by a corresponding growth in laboratory facilities and activities. The year 1939 saw the development of several large archaeological laboratories, particularly in the southeastern States, where the results of excavations were studied under careful technical supervision with the aid of WPA facilities. The many small laboratories maintained by individual organizations, and the several co-operative laboratories devoted to particular specialties continued to operate.

In addition to the annual meetings of various associations and societies a number of conferences were held. One of the best known of these was the Chaco Conference, held in New Mexico late in the summer, under the auspices of the University of New Mexico. About the same time a Tree-Ring Conference was held in the same area at a field station of the University of Arizona. In the late spring and the early fall two meetings were held of the Southeastern Archaeological Conference. In October the annual meeting of the Northeastern States Archaeological Federation, which is in the nature of a conference, was held in New York city. Such meetings are of especial value because they permit the many workers in limited areas to discuss current archaeological activities and compare opinions and points of view.

BIBLIOGRAPHY.—The great majority of publications during 1939 consisted of technical reports and articles in the journals and serials of various institutions and organizations. Further information concerning them, as well as additional details upon the archaeological activities of the many organizations working in the United States in particular, may be secured by consulting vol. V of *American Antiquity*, the quarterly journal of the Society for American Archaeology. The outstanding publication of the year was the five volume monograph entitled *The Inscriptions of the Pecten* by Sylvanus G. Morley, published by the Carnegie Institution of Washington with the imprint of 1938, but distributed during the early months of 1939.

(C. E. Gu.)

Eastern Hemisphere.—In spite of upset conditions during 1939, important archaeological discoveries were made in many sections of the Old World. Those dating from the Neolithic and later periods will be dealt with regionally; for the earlier periods the evidence as a whole will be discussed.

The Palaeolithic Period.—Excavations conducted by Professor

Breuil during the past summer near Abbeville in the Somme valley, northern France, have yielded hand-axes of Abbevillian type in a deposit definitely of First Interglacial age. In the Breckland region of eastern England, Dr. T. T. Paterson has established the Pleistocene stratigraphy and the age of the associated Palaeolithic industries. The Breckland sequence is of primary importance to all prehistorians in western Europe.

In the Union of South Africa great progress is being made in the field of Old Stone Age research under the supervision of Professor C. van Riet Lowe, Director of the Bureau of Archaeology. The Fourth Annual Report of the Bureau, recently published in Pretoria, includes an imposing list of activities undertaken during the past year. A useful summary of the Stone Age in Northern Rhodesia by J. Desmond Clark of the Rhodes-Livingstone Institute demonstrates the importance of the region for relating the South African sequence to that of Kenya and Uganda on the east coast.

An important Upper Palaeolithic station, the Cave of Ksar 'Akil, near Antelias in Syria, is being excavated by Fathers Doherty and Ewing of Weston college. The work has revealed a far thicker deposit of Middle Aurignacian than has been found elsewhere in the Near East. In India, E. C. Worman, Jr. of the Peabody museum, Harvard university, has discovered important new Palaeolithic sites in the extreme south of the peninsula, on the east coast between Calcutta and Madras as well as in Central India north of the Narbada valley. The most outstanding fact concerning this material is its essential similarity to the hand-axe cultures (Abbeville-Acheulean) of western Asia, Europe, and Africa. In the Far East—Java, Malaya, Burma, and China (Choukoutien)—a Lower Palaeolithic chopping-tool complex has been recognized, an extension of which reached the Soan region of Northern India during Middle Pleistocene times.

Fossil Man.—Early in the year Dr. G. H. R. von Koenigswald of the Geological Survey of Java discovered a complete maxilla and a portion of the occipital region of a heavy male Pithecanthropus in the Trinil beds (Middle Pleistocene) at Sangiran in Central Java. The skull (Pithecanthropus No. 3) was broken prior to death as the result of a blow, and the stone apparently used for this purpose was found associated with the fragments.

The year 1939 witnessed the discovery of three Neanderthals—one in each continent of the Old World. The first find, an eight-year-old boy, was made by Dr. A. P. Okladnikov in the cave of Teshik-Tash near Tashkent in Russian Turkestan. The skeleton, examined by Dr. A. Hrdlička, was associated with Mousterian implements, prehistoric animal bones and ash layers. A few weeks later, Dr. A. C. Blanc of the University of Pisa recovered a very well preserved Neanderthal skull in the Guttari cave at the base of Mount Circeo south of Rome. The cave's mouth had been sealed in antiquity, and the skull together with the bones of an extinct fauna was found on the surface of the cave deposits, which contained Mousterian implements. The lower layers of the High cave in Tangier, where Dr. C. S. Coon of the Peabody museum, Harvard university, excavated during the spring and summer of 1939, yielded a maxilla fragment of a child and an adult molar tooth of Neanderthal type. The site revealed an important sequence of cultures from Middle Palaeolithic to Roman times. Thus, recent finds in Asia, Europe, and North Africa strengthen the view that the Neanderthal race dominated a large portion of the Northern Hemisphere of the Old World before the maximum of the last Pleistocene glaciation.

In Australia a joint expedition by N. B. Tindale of the South Australian museum and J. B. Birdsall of the Peabody museum, Harvard university, has discovered human skeletons together with a giant marsupial fauna in an ancient sand dune on the old shore of the now dry Lake Menindee, New South Wales. This is the

first time that human remains have been found in direct association with an extinct fauna in Australia.

Neolithic and Later.—(a) *Anatolia and The Near East.*—In Turkey, Professor John Garstang excavated at Mersin, near Tarsus, on the Cilician Plain. Below a series of Iron Age, Imperial Hittite, and pre-Hittite levels, five strata (XII–XVI) were found which represent stages in the development of the Chalcolithic of the Near East. The lowest of these levels (early fourth millennium B.C.) contains polychrome pottery identified by the excavators as Tell Halaf ware (*Annals of Archaeology and Anthropology of the University of Liverpool*, XVI [1939] pp. 38–72). The remaining 9000. of culture deposit below level XVI revealed a basal Neolithic horizon containing only plain wares and stone implements. The site demonstrates an extremely early occupation of the Cilician Plain, as well as a Chalcolithic culture which had connections not only with Anatolia but also with Crete, Greece, and the Danube valley. The Mersin stratigraphy as far back as level XII (c. 3000 B.C.) has been checked by the very extensive work being conducted nearby at Tarsus by Dr. Hetty Goldman. It is expected that when the early strata at Tarsus are uncovered these sites will complement each other and amplify the picture of the early periods in Cilicia. The wider spread of the Halaf culture has been further proved by the excavations at Shamiramalti (Tilke Tepe) on Lake Van by Dr. Kirsopp Lake. In every respect the pottery from the earliest level at this site, which is near Van Kaleh—the fortified citadel of the Vannic kingdom, is unquestionably related to the true Tell Halaf ware of Northern Mesopotamia and Syria.

In Syria, Dr. Schaeffer's fine excavations at Ras Shamra produced a specimen of Kamares ware imported from Crete in a level dating from the middle of the second millennium B.C. Its stratigraphic position at Ras Shamra suggests that the date for the end of Middle Minoan II should be lowered by approximately a century. The Oriental Institute's Syrian expedition conducted test digging north of Tripoli at Tabbat al-Hammam, a site with an early layer containing Tell Halaf pottery and a later occupation: first millennium B.C. to Byzantine. Sounding trenches at the nearby site of Tell Simiriyan revealed Middle and Late Bronze Age levels. Sir Leonard Woolley's excavations at Alalakh, near Antioch, have produced further proofs of direct contact between Minoan Crete and the Asiatic mainland early in the second millennium B.C.

During the winter of 1938–39 Lauriston Ward and D. W. Lockard of the Peabody museum, Harvard university, made an archaeological reconnaissance trip to Syria and Iraq. M. E. L. Mallowan excavated interesting Bronze Age levels at Tell Djidli, a mound near Tell Abiad in the Upper Balikh valley of Northern Syria. The French excavations at Mari, an important site on the Euphrates in Western Syria, were continued under the direction of André Parrot. Levels of the third and fourth (Jemdet Nasr period) millennia B.C. were uncovered, and more clay tablets bearing Sumerian inscriptions were found.

Only the German expedition under Professor Nöldeke worked in Iraq during 1939. Although their work was continued at Warka (Uruk), the most important finds were made at Tell Halat Hadji-Mohammed—a small mound in the vicinity. Here the only pre-Ubaid level known in Southern Mesopotamia was discovered. In certain respects the pottery from this new horizon recalls the well-known Halaf ware of the north.

Under the direction of Gordon Loud, the Oriental Institute's expedition continued work at Megiddo (Armageddon) in Palestine. Excavations conducted in two areas of the mound revealed a large building of strata VIII–VII, and a group of three houses of the Megaron type in stratum XV (1950–1850 B.C.). These houses, contemporary with the great Egyptian 12th Dynasty, were associated with a large circular altar of solid masonry. The ce-

ONE OF A SERIES of relief panels of a Roman emperor, probably Vespasian, discovered in 1938 and 1939 under the Palazzo della Cancelleria, Rome

ramic content of stratum XV (Middle Bronze I) includes a distinctive red ware, which continues in XIV but dies out in XIII (1800–1750 B.C.) with the appearance of Hyksos forms. In addition to continuing his important survey of Bronze and Iron Age sites in Trans-Jordan, Dr. Nelson Gleuck, director of the American School of Oriental Research in Jerusalem, excavated at Tell el-Kheleifi on the Gulf of Aqabah. The 1939 work at this site, believed to be Ezion-Geber referred to in the Book of Kings as Solomon's seaport, revealed an extensive smelting and refining plant. In level III (late 8th century B.C.) many interesting inscribed and stamped pots were found in addition to Phoenician glass beads and two Egyptian amulets.

(b) *Egypt.*—On the western edge on the Delta the German Institute's expedition under Professor Junker continued excavations on the important prehistoric site of Merimde. At Hermopolis, in Upper Egypt, Dr. Sami Gabra of the Egyptian university discovered an important tomb of a high priest in the precinct of the Temple of Thoth. The Oriental Institute again worked on the splendid records of the Medinet Habu Temple and Karnak. As in former years, Professor Michalowski of the University of Warsaw excavated in the Old and Middle Kingdom cemeteries at Edfu. Dr. George A. Reisner and members of the staff of the Harvard-Boston expedition spent the past year preparing the report on the Giza cemeteries for publication. At Giza, Selim Bey Hassan produced conclusive proof that the Temple of Cheops was decorated in relief with limestone carvings. This discovery is important, and the new pieces add materially to the very meagre evidence for the decoration of a royal temple before the beginning of Dynasty V. At Tanis, Professor Montet discovered two tombs of Dynasty XXII; one of them contained the electrum coffin and fine gold jewellery of Sheshonk, which are of wide interest from the point

of the history of Egyptian art. The contents of a tomb of Dynasty I, found by Walter B. Emery at Saqqarah, give a vivid picture of the really high civilization that flourished in the Nile valley at the very beginning of the Dynastic period. Emery's brilliant discovery was the most significant single event of the past year in the Egyptian field.

(c) *Greece*.—By re-examining previously excavated areas in the vicinity of the famous shaft-graves at Mycenae, Professor A. J. B. Wace has established that the royal tombs are only part of an extensive prehistoric cemetery used from Middle Helladic to Middle Mycenaean times (c. 2000–1450 B.C.). Below the summit of the acropolis at Mycenae unique Late Mycenaean objects—an ivory carving and the head of a plaster statuette—were found. At Dendra in the Peloponnese, Professor Axel W. Persson discovered five Mycenaean tombs, one of which (Tomb IV) proved to be the sepulchre of a queen containing magnificent gold objects of c. 1400 B.C. Data secured at Athens by the American school, directed by Professor T. L. Shear, refutes the theory that Athens was a third rate settlement in the Mycenaean period. On the northern slope of the areopagus a royal tomb, evidently that of a queen of the 14th century B.C., was found. In addition to pottery and a number of excellent gold and bronze objects, a beautifully carved cylindrical ivory toilet-box or pyxis came to light. Recent work at Pylos, in the South-West Peloponnese, by Dr. Karl Blegen and Dr. Kourouniotis has led to the discovery of a Late Mycenaean palace. This site has yielded evidence of the utmost importance, since in the palace archives a great mass of tablets inscribed with Minoan characters (Linear, Class B) was unearthed. These are the first to be found on the mainland of Greece and make it seem obvious that writing was more generally known in Late Bronze Age Greece than has heretofore been supposed.

(d) *The Balkans*.—Reconnaissance by James H. Gaul of the Peabody museum, Harvard university, has revealed that the Early Neolithic (Körös) culture of Hungary, as well as the culture overlying the Körös levels at Vinča (which is related to the Tisza culture of Hungary) both extend eastward into the Sofia region of Bulgaria. Furthermore Tisza pottery has been found at Olynthus near Salonica in Greece, and Vinča figurines have appeared at Dikili Tash in Greek Thrace. In the Upper Struma valley of Western Bulgaria, Mr. Gaul has discovered sherds identical with the Early Neolithic of Greece. At Karanovo in Southern Bulgaria, Dr. Vasil Mikov of the National Museum, Sofia, has proved that the Early Bronze Age culture of Macedonia (described by Heurtley) occurs above the Bulgarian Tell (Gumelnita) culture, which is of the Chalcolithic period. Thus the Macedonian Early Bronze Age forms an integral part of the Bulgarian development.

(e) *Western Europe*.—In Northern France, Dr. R. E. M. Wheeler of the London museum excavated several Late La Tène sites in Normandy. These proved to be hasty defences thrown up by the Gauls against the Roman invasions. Professor E. E. Evans of Queen's university, Belfast, continued his interesting excavations at Lyle Hill in Northern Ireland during 1939. This important site, a fortified hill-top camp with Windmill Hill pottery, is the first real Neolithic settlement to be excavated in Ireland.

By far the most spectacular discovery in Western Europe during 1939, and one of the most remarkable finds ever made in England, was the ship-grave of an Anglo-Saxon king found in the Sutton Hoo tumulus beside the river Deben in Suffolk. Careful excavation directed by C. W. Phillips revealed not only clear traces of the boat but also the outline of the ship itself—a vessel 82ft. long and 16ft. in the beam. The centrally located burial contained jewellery and personal belongings of barbaric splendour, which makes the tomb the richest of its kind so far found in Western Europe. The most impressive feature of the Sutton Hoo treasure is a set of provincial Byzantine plate; one magnificent silver dish

bears the marks of the reign of the Emperor Anastasius I. It has been suggested that the chieftain may have been Redwald, King of the East Angles (died c. 620 A.D.), who was the first of his lineage to become High King of England.

(f) *Poland*.—For the past five years extensive excavations under the direction of Professor J. Kostrzewski at the important Early Iron Age (700–400 B.C.) site of Biskupin, an island in a lake northeast of Poznan (*Travel*, Oct. 1939, pp. 16–19). This extraordinarily well preserved village, which covers an area 6½ac., was surrounded by high wooden fortifications; it has yielded rich finds of the ancient Slavonic culture. The streets, paved with logs, were laid out in parallel east-west rows between the wooden houses, with an outer one spanning the settlement inside the ramparts, the top of which served as a walk.

(g) *U.S.S.R.*—Expeditions from the Marr Institute of the History of Material Culture, Leningrad, have been active recently (H. Field, and E. Prostov, *Amer. Jour. Semitic Languages and Literature*, lvi, 1939, pp. 438–440). In the Crimea (Kerch Peninsula) B. F. Gaïdukevich continued excavation on a settlement belonging to the slave-owning Bosphorus kingdom (6th century B.C.—4th century A.D.). This expedition also dug near Kerch at Nymphaeum, the site of an Hellenic city attributed to the 4th or 5th century before our era. Two hundred miles northeast of Tashkent the site of Tarāz has been identified by A. N. Bernstam in the southern part of Kazakhstan. The ruins of this city of the first millennium A.D., mentioned by Byzantine, Chinese, Turkish, and Arabian writers, were found quite unexpectedly in the centre of Dzhambul, near the Uzbek frontier.

(h) *Afghanistan*.—A reconnaissance expedition sent out by the Victoria and Albert museum and the Royal Geographical Society under the leadership of Evert Barger to the Plain of Bactria in the Oxus valley has discovered important Greek remains at Kunduz. A large number of mounds were mapped and much valuable data secured, including Greek and Sassanid seals and coins.

(i) *India*.—Although very little actual excavation was done in India during the past year great significance may be attached to the survey of the present state of research in that country conducted by Sir Leonard Woolley. Woolley's report, which has just been published, contains recommendations which it is hoped will give new impetus to the Archaeological Survey of India. In the meantime, the India Society, London, published during the past year an excellent summary covering the historical periods, entitled *Revealing India's Past*. The book is written by 22 authorities and is edited by Sir John Cumming, Vice-Chairman of the School of Oriental Studies.

(j) *Malaya*.—The expedition of the Greater-India Research Committee under the direction of H. G. Quaritch Wales has been doing excavations of the utmost importance in Malaya, where no systematic work has ever been done on the archaeology of the Hindu period. Over 30 sites, most of them in Kedah, were dug and evidence was obtained suggesting that Buddhism was introduced in Southeastern Asia more than a century earlier than was hitherto suspected. In the remains of ruined Shiva temples, dating from the 4th to the 13th centuries A.D., much valuable information was secured. This contributes to the problem of the cultural expansion of ancient India which culminated in the flowering of the Indo-Javanese and Khmer civilizations of the Far East.

(k) *China*.—In spite of military activities the research work of *Academia Sinica* on the remains found at Anyang has continued at the expedition's new headquarters in Yunnan. Anyang has yielded extremely important Bronze Age material dating from the Late Shang period (1300–1100 B.C.). Near the city of Ch'ang-sha, Hunan Province, John H. Cox of Yale-in-China has made startling discoveries in cemeteries containing burials of the Late Chou, Han, and Six Dynasties periods (6th century B.C.—6th century

A.D.). The material adds enormously to archaeological knowledge of the Yangtse valley and demonstrates what has long been suspected—the presence of a high civilization in that region at an early period.

BIBLIOGRAPHY.—Except where otherwise stated, further information concerning many of the most important discoveries mentioned above may be obtained by consulting the 1939 numbers of *The Illustrated London News*, *Asia*, and *Antiquity*. (H. L. Ms.)

Archery. At the 59th annual tournament of the National Archery Association, which was held in St. Paul, Minn., July 17–22, 1939, Pat Chambers of Portland, Ore., successfully defended his championship title and set up a record of 134–826 in the Single York round. Mrs. Belvia Carter of Seattle, Wash., won the ladies' title by a narrow margin over Miss Jean Tenney of Clear Spring, Md., the defending champion; but during the tournament, Miss Tenney set up a new record of 72–492 in the Single National round. A new record in the Single Columbia round of 72–552 was established by Mrs. Beatrice Hodgson of San Pedro, Calif. In the flight shooting, Curtis L. Hill of Dayton, O., made a record of 517yd., 1ft., and Mrs. Millie Hill of Dayton, O., set up a record of 374yd., 2ft., 5 inches.

During 1939 there was a marked increase of interest in field archery as distinguished from target archery. Field archery associations have been organized in several States, and the organization of a national field archery association is well under way. In May 1939, the National Archery Association sponsored the 10th Annual Women's Intercollegiate Telegraphic Archery Tournament which was participated in by over 1,000 students from 99 colleges. This event was won by Team No. 1 from Los Angeles City college. One of the spectacular archery events of 1939 was the shooting of an arrow 896yd. by Ken Wilhelm of Yermo, Calif. This was done in the so-called "free style," lying on his back with the bow strapped to his feet and using both hands to draw the string. With the bow held in his hand and shooting in regular form, Mr. Wilhelm made a shot of 579.7 yards.

(L. C. S.)

Architecture. The beginning of another war in Europe in the fall of 1939 arrested normal architectural development on the Continent and in England. Up to that point conflicting social and political aims had left their stamp on architecture. In countries where the right to freedom of thought prevailed progress in design was more pronounced than in the totalitarian States where the appearance of buildings was dictated by Government regulation or suggested through examples of national style characteristics. Depressed economic conditions restricted the activities of private building and caused the continuance of Government building programs aimed at the stimulation of employment. For this reason much of the architecture and the trend of architectural development had to be attributed to Governmental bureaus instead of to individuals. Some countries dedicated their building programs to social measures, such as housing, clinics, recreation camps, playgrounds, etc., while in other countries they gave expression to the glorification of national ideals. With the advent of the war, civic building lapsed and military architecture increased. The effect of air raids on buildings and on centres of populations became of architectural importance. The ingeniously constructed defence lines on the borders of Germany and France stood their first test. While Europe settled down to warfare, opportunity for leadership in architectural development shifted to the United States. European architectural influence, however, still continued indirectly through the work of European architects who came to America during the period of social unrest preceding the war.

Modern Architecture.—The motive behind modern architec-

ture was a liberation from the restrictions and formalities of the patterns of the past. The two principal schools of modern architectural thought, which were separated by a difference in the interpretation of this new freedom, drew closer together. Architects who stood for the scientific reasoning of functionalism as a basis of design were approaching the theories of modernists who set beauty of forms as their aim. In 1939 less influence came from Le Corbusier whose writings constitute the major background of functionalism. Frank Lloyd Wright who represented the other school of thought gave a series of lectures in London which counteracted the influence of the functionalist on the minds of the younger men in England. The premise both schools had in common was characterized by precedence of the considerations of space over mass, open planning for a flexible use of interiors, the absence of symmetry, a lighter appearance of construction, and a greater use of glass. The barrier which remained was the difference in interpretation of decoration in architectural design. Functionalists opposed the use of ornament, while Frank Lloyd Wright and his followers often resorted to it as a means of giving interest to architectural surfaces. Towards the end of the fourth decade of the 20th century, functionalists tended to pay greater attention to surface treatment by the increased use of curves, breaks, and varied textures. The contributions to functional architecture by individual designers who have given their personal interpretation to the original theories, contributed greater aspects of individuality and more personal characteristics than were found in the earlier form of functionalism, known as International Style.

Traditional Architecture.—Sentiment for the past and long association continued to give traditional architecture a strong hold. Forms were simplified to fall in line with the modern trend but the general characteristics remained; adherence to the basic patterns of the past, a leaning toward symmetry in plan and elevation, an effect of solidity, openings of vertical proportions, mouldings and applied decoration. While native domestic architectural styles for residences furnished the design prototypes, the formulae deduced from classic architecture combined with the teachings of the academies, governed the design of the more prominent buildings in most countries. Wherever a country established a national architecture it was found expedient to use a style of classic derivation. This was seen in previous years in Russia and Germany, and in 1938 in Italy.

Materials, Methods, Construction.—As labour costs rose synthetic materials were found as substitutes for the costlier types of materials. In residential work dry construction gained in use. This method eliminated plastering and thereby saved the time and heat necessary to dry out buildings as well as the finish which has to be installed to cover wood exposed to damage by plasterers. There was a greater awareness of the difficulties entailed in the pre-fabrication of complete houses, but the use and manufacture of pre-fabricated parts of buildings increased. Plywood underwent further developments; it became a well established surface material and its structural uses were extended. In the field of building equipment many new devices appeared on the market. There was a tendency to recognize the value of heating systems which had lower temperatures at the source of heat in the rooms. Isolated experiments with panel heating by warming floors or ceilings continued in the United States. Fluorescent lamps found ready acceptance in the same country and new types of light fixtures were developed and manufactured for their use. A polaroid lamp was also made available for diminishing eye strain due to reflections.

Examples of Recent Architecture.—Functional architecture brought to England by architects from the Continent continued to exert its influence on the architectural development of that

country. It caused a simplification of the traditional styles which were still chosen for the larger portion of buildings. The newer flats showed the usual modern design elements: windows in horizontal bands and the predominance of openings over masonry. In functional designs there was a greater tendency to use projecting surfaces, as for instance, at the Highgate flats (Tecton, architects). The penthouse which was later completed on the second flat known as Highpoint No. 2 followed in the use of curved surfaces a newer modern trend. The Health Centre for the Borough of Finsbury by the same architects showed the part architecture has played in the organization of social services. The building was designed to co-ordinate medical clinics and offices and to offer lectures on subjects affecting public health and welfare. Many of the larger residences followed functional architecture. The house near Halland in Sussex by Serge Chermayeff, architect, used as its principal façade facing the garden and the sun, a concrete grid with glass in large sheets between the columns and beams. A house in Esher, Surrey (Patrick Gwynne and Wells Coates, architects) followed a principle first advocated by Le Corbusier; the main mass of the building was elevated on posts. An opportunity for the expression of a modern social need was given to Walter Gropius and Maxwell Fry in the Impington Village college of Cambridgeshire. This building functioned as a centre of the cultural and social life of a rural region and offered educational facilities for young and old.

For official architecture, England preferred traditional designs as seen by the new Government building of Edinburgh (Thomas S. Tait, architect) and the Town Hall at Wolverhampton (E. D. Lyons and L. Israel, architects). The new hospital at Chichester (C. G. Stillman, architect) resorted to the rambling open plan instead of the multistoried type which supplanted open schemes elsewhere in the interest of efficiency of circulation and service. In France, the strong position of the Ecole des Beaux-Arts stifled the growth of modern architecture. The continuing influence of this academy can be seen in the typical official architecture as exemplified by the Museum of Public Works (A. and G. Perret, architects), in the French Legation at Belgrade (R. H. Expert, architect), as well as in the French Pavilion at the New York World's Fair by the same architect. In general a fondness for motives of classic derivation and applied decoration prevailed.

Modern architecture found its expression more in writings and theoretical designs than in executed buildings. To the well-known publication of Le Corbusier must be added the studies of Paul Nelson for a "Suspended House" and a science museum "Palais des Découvertes."

The League of Nations Building in Geneva, Switzerland, exemplified the force of influence French thought played in its design. In adhering to the patterns of French academic design, it stood in contrast to the functional architecture which found wide following in the German section of Switzerland.

Sweden and Finland, since the war of 1914-18, have held an important position in the field of modern architecture. The Building Trades building in Stockholm exemplified the modern characteristics of the work of Sven Markelius who contributed much to the movement of modern Swedish architecture from the neo-classic style to functionalism. The Swedish Pavilion at the New York World's Fair by the same architect held throughout its design one of the most distinguished positions among the exhibition buildings.

The work of Alvar Aalto of Finland as seen in the Gullichsen House near Pori, brought modern architecture to a higher point of development; it produced the balanced combination of reason and emotion as guiding forces to design.

In Italy the aim of the Italian architecture was not solely the glorification of the State but more the benefit of the people. The

vacation homes at Tirrenia (Paniconi and Pediconi, architects), at Cesenatico (G. Vaccaro, architect), and at Bardonecchia (G. Levi Montalcini, architect) show that architects still had sufficient freedom to express similar problems in different ways even though efforts to establish an Italian national style were apparent in the official buildings.

Germany continued to develop gigantic projects which aimed to express the ideals of National Socialism. An official style was established for this purpose; buildings showed a stamp of uniformity which resulted from Government regulations for design and work carried out by large bureaus instead of individual architects. Designs for the rebuilding of Berlin were well under way. The main avenue proposed as a new North-South axis of the city was to provide sites for ambitiously conceived Government buildings at several round points located at the intersections with principal streets. A circle of huge buildings which neared completion before the beginning of the war in 1939, formed the terminating feature of the axis and an imposing gateway to the city. In Munich the Königplatz was reshaped and plans completed for the rebuilding of the Odeonplatz and the construction of a new opera house seating 2,600 spectators.

In Russia, the Club of Moscow (Molotov and Tchekmotaieff, architects) showed like most Russian architecture of the end of the 1930s a fondness for classic pomp. There has been a vogue for erecting gigantic statues on the top of buildings which started at the Palace of the Soviets (Iofan, Stchovko, and Helfreich, architects) and continued on some official buildings in Moscow as well as on the Russian Pavilions at the Expositions of Paris, 1937, and New York, 1939.

A competition was held in Turkey for a new Parliament building at Ankara. The winning design by the Austrian architect, Clemens Holzmeister, repeated the use of simple forms seen in the palace for the President of Turkey by the same architect. It stood in contrast to a design by J. Vago in which elements of Byzantine and Moslem architecture were featured.

The direction of architectural development in the United States still remained undefined at the end of 1939. The New York World's Fair and the San Francisco Golden Gate International Exposition brought out the influence of business and industry on American architecture. The profusion of commercial exhibits in the New York Fair showed the role that advertising and mass consumption played in the shaping of architecture. The foreign pavilions expressed the national characteristics of the countries they represented.

The large volume of building carried on by the Government or coming under governmental control tended to perpetuate traditionalism. The Procurement Division of the Department of the Treasury was responsible for the architecture of many imposing post offices, court houses and Federal buildings throughout the United States. The Tennessee Valley Authority completed dams and power houses which combined a straight-forward simple expression of functional needs with the use of classic proportions.

To individuals and group of individuals belonged the credit for furthering modern aims. While the houses of Frank Lloyd Wright continued to show the characteristics of a modern architecture which has grown on American soil, the houses of William Lescaze, Richard Neutra, and Walter Gropius were in form and spirit expressions of functionalism imported from Europe. The new building for the Museum of Modern Art in New York (E. Stone and P. Goodwin, architects), showed the best of functional theories applied to American conditions. The work of students in architectural schools and primarily the designs submitted in competitions indicated a more general acceptance of modernism by the younger men. The design submitted by Eliel and Eero Saarinen. J. Robert F. Swanson, associates, in a competition for the Smith-

sonian Institute at Washington in its very modernism stood in contrast to the traditional architecture seen heretofore in the Government buildings. Likewise the winning design by Eliel and Eero Saarinen, J. Robert F. Swanson, associates, for a proposed School of Fine Arts and Festival Theatre at Williamsburg, Va., indicated a growing acceptance of modernism.

Argentina, second largest country in South America, a re- public on the Atlantic coast of Southern South America; language, Spanish; capital, Buenos Aires; president, Dr. Roberto M. Ortiz.

Area and Population.—The area is 1,079,965 sq.mi., slightly over a third of that of the United States. No official census has been taken since 1914, but the population was officially estimated (Dec. 31, 1938) as 12,958,217 (an increase of 196,708 in the year, of which 20% was by immigration). Native-born of Euro- pean stock total 76.9%, mixed blood 3.2%; foreign-born (practi- cally entirely Europeans), 19.9%. The percentage of white popu- lation is greater than in any other American country except Can- ada. The bulk of the population is of Spanish blood, with an im- portant Italian element estimated at one-third. Nearly 250,000 persons are of German birth or parentage. The chief cities (with officially estimated populations) are: Buenos Aires, 2,345,221 (3,666,585 with its suburbs); Rosario, 511,411; Avellaneda (a suburb of Buenos Aires), 233,950; Córdoba, 213,208; La Plata, 192,225; Tucumán, 146,641; Santa Fé, 145,758; Bahía Blanca, 109,660; Mendoza, 82,277; Paraná, 72,288. Twenty-seven other cities have populations in excess of 25,000.

History.—The Government is Federal in form, with legislative powers vested in a congress. During 1939, the administration of President Ortiz continued its strong stand for democracy and against non-American entanglements, and carried out a program emphasizing public works, social betterment (especially educa- tion), and the development of a greater national self-sufficiency. Some recovery was made from the depression of 1938, due to larger agricultural production and, late in the year, to the in- creased demand and somewhat higher prices for raw materials as a result of European war.

International relations were conducted vigorously by Foreign Minister José María Cantilo. After declaring neutrality in the European war, Argentina participated in the Panama Conference, and assumed leadership in the expulsion of Russia from the League of Nations in December. The engagement of the German pocket- battleship "Graf Spee" with three British cruisers off the coast of Uruguay and the subsequent flight of its crew to Argentina waters after they had scuttled the ship, involved her in diplomatic inter- changes with Germany, who protested the internment of the

"Spee's" men. (See HISPANIC AMERICA AND THE EUROPEAN WAR.)

Early in April, publication of documents purporting to reveal German designs on scantily populated Argentine Patagonia led to a Government investigation of the Argentine Nazi party and other German-influenced groups. The Government then issued a decree (May 15) outlawing all organizations with foreign political leadership or financial support. Italian fascist organizations and the Spanish Falangists, as well as the Nazis, were affected.

Foreign trade problems were one of Argentina's major concerns in 1939. As a result of the large excess of imports over exports in 1938, a rigid import control policy was adopted in Feb. 1939, designed especially to limit imports from countries selling more in Argentina than they bought. Despite official espousal of a multi-lateral trade system as Argentina's ultimate goal, the Ortiz administration continued its previous policy of bilateral trade treaties. During the year's course, barter agreements with Germany and Italy, an exchange agreement with Brazil, commercial treaties with Denmark and Spain, and "most-favoured-nation" agreements with France and Norway were made. In November formal negotiations were begun with the United States for a reciprocal trade agreement to end the long period of chaotic trade relations between the two countries, and were still in course at the close of the year. The highly competitive nature of Argentina's leading exports, coupled with the imminence of presidential elections in the United States, made the outcome quite doubtful, however. Meanwhile, exchange and import restrictions against United States products, whose quota had been cut 40% in February, were materially relaxed in some respects when European war threatened to cut off Argentina's normal sources of supply. Nevertheless, Government emphasis was placed on purchases from Great Britain and France.

Politically, the feature of the year was President Ortiz's campaign for clean elections, which brought him into sharp conflict with the conservative political factions which had elected him. Federal intervention (a presidential prerogative) in San Juan and Santiago del Estero provinces earlier in the year was followed in December by President Ortiz's demand that the governor of Catamarca annul fraudulent provincial elections which the conservatives had won. A major political crisis loomed when the vice-president and three members of the Ortiz cabinet supported the governor. The crisis was expected to reach its peak with the convening of the Catamarca legislature on Jan. 3, 1940.

The national public works program was continued through 1939, with an authorized expenditure of 200,000,000 pesos in addition to the extensive highway-construction program (financed by the imposition of new and the increase of old automotive fuel taxes). Purchase of the Córdoba Central and the TransAndine railways by the Government was consummated during 1939 after several years of negotiations. The prices were £10,000,000 and £750,000, respectively.

Education.—Culturally, Argentina is one of the most advanced of all Hispanic American countries. Education, gratuitous and obligatory between the ages of 6 and 14, is in the hands of the national and provincial Governments. There are over 12,000 elementary schools, with over 1,750,000 pupils (5,100, with over 830,000 enrolment, are nationally supported). Public secondary schools number 258, with 106,000 enrolment. In addition there are numerous private schools (elementary and secondary). Their curriculum is under Federal supervision. There are six national universities, including the University of Cuyo, established in March 1939, and one private university, with a grand total of over 25,000 students. The national universities of Buenos Aires and La Plata have high international standing.

Army and Navy.—The Argentine Army includes an active force of 30,713 men and a trained reserve of 448,383. Military or

naval service is compulsory. The Navy is the largest in South America. Naval personnel totals 20,265, including 5,000 conscripts. The air strength is in excess of 250 planes.

Finance.—The monetary unit is the peso, valued (Dec. 1939) at 22.7¢ U.S. (Unofficial rate.) Until the outbreak of the European war the official rate was maintained at 17 pesos to the pound. With the decline of the pound in terms of dollars, the rate was readjusted (September 12). The 1939 budget, which provided expenditures of 1,094,000,000 pesos and estimated income at 726,000,000 pesos (actual revenues: 876,512,000 pesos), was continued for 1940. Profits from exchange control and bond issues were expected to cover the deficit.

Trade and Communication.—In 1937 Argentina's exports totalled 2,310,997,802 pesos (agricultural products, mostly cereals, 64.5%; livestock products, largely meat, 31.4%; forest products, 2%). In 1938 exports were 39% less, or 1,400,294,000 pesos (agricultural products, 47.44%; livestock, 45.6%; forest products, 2.95%), taken principally by Great Britain, 32.8% (29.1% in 1937), Germany, 11.7% (6.8% in 1937), and the United States, 8.5% (12.8% in 1937). The Netherlands and Belgium took 7.5% and 7.2%, respectively. Imports (principally textiles, petroleum products, machinery, and miscellaneous manufactured goods), were 1,419,438,441 pesos, a 6.3% decline, and came chiefly from Great Britain (18.3%), United States (17.7%), Germany (10.1%), Italy (5.5%), Belgium (5.2%), and France (4.3%). In the first 11 months of 1939, imports were 9.8% less, totalling 1,195,828,656 pesos (Great Britain, 20.1%; United States, 16.4%; Germany, 9.9%; Belgium, 6.7%; Brazil, 6.3%; France 6.0%). Exports aggregated 1,417,543,467 pesos, an 11% increase (Great Britain, 34.0%; United States, 11.3%; Netherlands, 7.2%; Belgium, 6.4%; Germany, 6.3%). After September, German trade was all but non-existent.

By far the greater part of Argentine external commerce is handled through Buenos Aires, which is served by numerous steamship lines and is the hub of the country's intricate railway system. Bahía Blanca to the south and Rosario on the Paraná are also important. Comodoro Rivadavia, in southern Patagonia, is the centre of the growing oil industry. Railway connections link the country with Chile, Bolivia, Paraguay, and Uruguay. Excellent air communication provides transport to all parts of America. Regular service was maintained with Germany until Sept. 1939.

In 1937 there were 377,473 telephones in the country (over half of them in Buenos Aires), 47.49% of the grand total for all South America. The Government-owned telegraph lines are 140,000mi. in length. Over 40 radio stations, including one short-wave, are in operation.

Argentina has approximately 43% of South American railroad mileage and ranks sixth in the world, with 45,651km. in 1939. The highway system totals 308,248km., of which 16,565km. is paved road. Over 55,000km. is under national control. The national highway program of 1932 was rapidly pushed during 1939. By late 1939, the principal highways constructed or under construction were: Buenos Aires to southern Argentina, 1,920mi. (practically complete as far as Bahía Blanca, 397mi.); Buenos Aires-Mar del Plata, 240mi.; Buenos Aires-Mendoza, 660mi. (approximately two-thirds complete); Buenos Aires-La Quiaca (the Bolivian frontier), 1,260mi. (720mi. completed); and the North-South highway (the most ambitious of all the road projects, extending from Los Andes in the extreme north to Santa Cruz in the far south, and paralleling the base of the Andes), 2,811mi. (1,428mi. completed). This network, when completed, will connect with the Inter-American highway system. An annual expenditure of 100,000,000 pesos, half of which is derived from gasoline taxes, is being made for national and provincial highway systems.

Agriculture and Livestock.—Argentina's resources are primarily agricultural and pastoral, with 10.8% (74,130,000ac.) and 44.4% (306,404,000ac.) respectively of the entire area of the country devoted to them. The chief agricultural products are cereals and linseed. Except for maize (5,400,000 metric tons), production in 1938-39 was generally good. Wheat (9,150,000 metric tons) was second to the all-time high of 1929, and Argentina ranked fourth in world production. Crop estimates for 1939-40, however, were 4,000,000 tons, against a ten-year average of 6,245,000 tons, and with good crops elsewhere, Argentina was expected to rank seventh. Linseed, in whose production Argentina leads the world, was estimated at 1,250,000 tons, 11.4% less than 1938-39 (1929-39 average, 1,714,000 tons). Other important crops, with 1939-40 estimated tonnage (1929-39 average in parenthesis) are: oats, 900,000 (842,000); barley, 750,000 (514,000); rye, 360,000 (210,000); birdseed, 32,000 (30,000). Cereal exports during 1939 exceeded those of 1938 by an excess of 70% in volume, but low prices held the value increase to less than 20%. Wheat, selling at the lowest price in three centuries, was heavily exported, with a total of nearly 5,000,000 metric tons in the 12-month period ending Nov. 30, 1939.

Other important agricultural products are cotton, sugar, wine-grapes, and peanuts. In 1938-39, 412,000 hectares were in cotton, with a production of 70,891 tons. Sugarcane production, largely in Tucumán province, was 5,321,979 metric tons. Fruits are extensively produced in Mendoza, along the eastern slope of the Andes, and in Patagonia. In 1938, 32,924 tons of fruits were exported, pears constituting over half. In the first ten months of 1939, fresh fruit exports rose sharply, to 52,568 tons (pears 53%, apples 22%).

Agriculture and livestock together account for 95% of the exports. The livestock census of 1937 showed a total of 43,790,166 sheep, 33,100,152 beef cattle, 8,527,181 horses, 4,875,990 goats, 3,975,716 hogs, 905,041 mules and asses, along with 43,285,211 poultry, 414,296 rabbits, and 262,322 beehives. Beef and mutton, in canned and chilled form, constitute a leading export. War demands caused a heavy increase in exportation in the last months of 1939, with a single British Government contract calling for 200,000 tons of beef.

The fishing industry, although still small, is rapidly expanding.

Mineral and Forest Products.—Timber is very limited except in the subtropical north, where quebracho, source of tannin, has been extensively developed. Argentina produces two-thirds of the world's tannin supply. There are approximately 50,000 hectares of industrially valuable timber, principally quebracho. Argentina produces 60,000 metric tons annually of maté (Paraguay tea), 60% of the world supply, chiefly for domestic consumption, with 63,000 hectares under cultivation. There is very little mineral wealth other than petroleum. Argentina is 11th in world petroleum production, with a record output of 2,714,824 metric tons in 1938, and 1,450,178 tons in the first half of 1939 (8.46% increase). The principal fields are in southern Patagonia (near Comodoro Rivadavia), in Salta and Jujuy in the extreme northwest, and in Neuquén Territory. State owned fields account for slightly over half of all production, and all new fields are reserved by law for Government exploitation.

Manufacturing.—Manufacturing, although rapidly developing, is in no way adequate for the country's needs. In 1936 domestic consumption of goods reached 4,817,000,000 pesos value, of which 23.2% was imported, compared with 40% importation in the period 1910-13. The 1937 industrial census showed increases of 20 to 30% over 1935, with 50,689 industrial establishments, 733,651 employees, and an annual payroll of 1,001,113,000 pesos. Value of raw material used was 40% greater than in 1935 (2,880,523,000 pesos), the finished product 36% greater (4,708,379,000

pesos). Industrial activity is largely in foodstuffs and in the rapidly growing textile industry.

BIBLIOGRAPHY.—A. Weddell, *Introduction to Argentina* (1939). (L. W. BE.; R. H. SH.)

Arizona. Arizona, one of the two youngest of the United States, was admitted with New Mexico in 1912; area, 113,956 sq.mi.; population according to the U.S. census of 1930, 435,573. After an intermediate decline the development of agriculture and renewed activity in mining have produced a conservative estimate of 450,000 in 1939. The capital is Phoenix, 48,118. Of the population 264,378 were native and foreign-born white, 10,749 coloured, and 160,446 other races, chiefly Mexican and Indian.

History.—The State officials, 1939, were chief justice, A. G. McAlister; governor, Robert T. Jones; secretary of State, Harry M. Moore; attorney general, Joe Conway; treasurer, William Peterson. The governor's promise of an efficient administration, together with his message advocating a revision of the taxing system to be devised by an impartial and out-of-State agency, roused favourable comment. The new administration, however, soon effected control of the political machine by gaining complete mastery of the highway department through a new organization over which the governor had absolute command. The governor's highway bill became a law mainly through support of the mining interests who feared the tax reform proposal of the administration. The latter never became a law. The governor gained more power through his proposed measure to remove control of liquor from the tax commission to a superintendent named by the governor. The change was favoured by liquor advocates who feared that further ineffective control might induce prohibition. The civil service bill, carefully prepared and ardently supported by advocates of the merit system, was again defeated. Also the strongly supported measure providing for retirement of public school teachers was defeated. The legislature provided for conditional ratification of the Santa Fe compact allocating the water of the Colorado river. To become effective this agreement must be approved by the legislatures of California and of Nevada as well as by Congress.

Charities.—In Oct. 1939 there were 37,977 cases or families receiving some form of public aid with a total monthly expenditure of \$667,253.79 which was 27% less than 1938.

Agriculture and Mining.—Citrus fruit, cotton, lettuce, and beef cattle comprise three-fourths of the value of agricultural products of Arizona. Arizona is sole producer of American-Egyptian or long staple cotton. In 1939 there were 188,000ac. of short staple and 41,000ac. of long staple cotton, a total increase of 10,000ac. over 1938. Arizona is the largest producer of sugar beet seed with 4,250ac. harvested in 1939. The grapefruit harvest was estimated at 2,500,000 boxes. Lettuce was produced from a total of 31,000 acres. Copper production for the last quarter of 1939 was at full capacity resulting in increased dividends and further expansion and totalling an excess over the 420,351,310lb. of 1938. The Magma Copper Company dividends increased \$1.25 per share in 1939. The Phelps Dodge Corporation had by Nov. 1939, removed from the Morenci open-pit mine over 15,000,000 tons of a planned total of 37,000,000 tons of overburden. (H. A. H.)

Arkansas, twenty-fifth State of the United States, popularly known as the "Bear State"; area, 53,335 sq.mi., population (U.S. census, 1930), 1,854,482; (estimate July 1, 1937), 2,048,000. Capital, Little Rock, 81,679; the next largest city is Fort Smith, 31,429. Hot Springs, a well known health resort, has 20,238. The rural population of the State (1930) was 1,471,604, or 79.4%. Of the total population 478,463 were Negroes, 10,173 foreign born. The State officials serving 1937-39

were re-elected in 1938 for another term of two years. They are: governor, Carl E. Bailey; lieutenant-governor, Bob Bailey; secretary of State, C. G. Hall; attorney-general, Jack Holt.

History.—In 1937 Governor Bailey persuaded the legislature to pass a civil service law which was the first in the South and which was regarded as an excellent law. The administration of the law the first year was good and this brought out vociferous opposition from the advocates of the old system with the result that the act was repealed. But fate was against the repealers, for the Federal administration of the security board compelled the selection of employees by the merit system. The auto test law was also repealed. The sales tax, which was enacted in 1935 as an emergency measure for the public schools, was now made permanent. The larger part is devoted to the public schools. An appropriation was made for a large annex to the State sanitarium for tuberculosis patients. The amendment authorizing the legislature to pass a workmen's compensation act was adopted in Nov. 1938. Such a law passed the legislature with the approval of employers and employees, but was opposed by many lawyers. The law provides for an "insurance plan" and abolishes the common law of "contributory negligence," "assumption of risk," and "fellow servants' negligence." A new election law provides for duplicate ballots and duplicate ballot boxes. Also a presidential preferential primary is authorized but is not likely to be used because the national convention is usually held before the State primary.

The governor suffered only one major defeat in his legislative program. He championed a bill to provide free text books for high schools (such a law was already in effect for the grades), but the schoolmen of the State rallied to the opposition and defeated it. In 1938 an amendment was adopted which prohibits any one appointed to fill a vacant office from becoming a candidate to fill that office at the next general election. The attorney-general has ruled that one cannot evade this provision by resigning from the office to which he has been appointed. The workmen's compensation act, the Refunding Act, and the act fixing the place of trial in cases growing out of suits for personal damages were all held up by the referendum. They are to be voted on Nov. 1940.

Education.—The enrolment in the public schools for 1938-39 was 478,324 or 13,052 higher than that of the preceding year. Most of this increase was in the grades, but NYA benefits helped to increase the high school enrolment also. Better tax collection gave a slightly larger sum to the schools, something over \$13,000,000. Three new buildings were erected at the University of Arkansas and some at several of the other State institutions. The future of the medical school, a part of the university, was assured by a contract with the city of Little Rock for the use of its hospital.

Banking and Finance.—The banking situation is sound. There was a slight decline in the number of State banks, which was due to liquidations, not to failures. The capitalization of the 50 national banks was unimpaired and their resources showed a healthy condition. The increase in bank clearings was notably large toward the close of 1939. The State debt of \$153,279,204.89 was reduced slightly. Tax collections were better and there was a small increase in assessed valuation.

Agriculture, Manufacturing, and Mining.—Cotton continued to be the leading crop. The estimated production for 1939 was slightly higher than in 1938, 1,410,000 bales, worth \$62,040,000; cottonseed, 627,000 tons, worth \$13,418,000; corn, 32,318,000bu., worth \$21,330,000; hay, 1,080,000 tons, worth \$8,532,000; rice, 8,721,000bu., worth \$6,628,000; potatoes (Irish and sweet), 5,683,000bu., worth \$4,580,000. There was a large increase in fruits, especially peaches, apples, and grapes, with a corresponding increase in value. The pecan crop was 3,543,000lb., worth \$315,000. The estimated farm value of 32 important crops was \$129,-

201,000 as compared with \$122,105,000 for 1938. A noteworthy development in industry occurred in 1939, about 100 new plants being developed. The largest of these was a \$750,000 gasoline extraction plant owned jointly by several producing companies in the Magnolia field. Several new oil wells were brought in and the total production was well over 1938's output. An increase in building activity called for more lumber and several new mills were opened in addition to the re-opening of many which had been closed. The demand for cedar posts was greater than the supply. Numerous quick-freeze and dehydrating plants responded to agriculture's demand for the preservation of its foodstuffs and feedstuffs. The outbreak of war in Europe stimulated the mining industry in several fields, notably zinc, manganese, and cinnabar. In the case of the latter the war simply caused imports virtually to cease, in consequence of which the price more than doubled. A production of 10 to 12 pounds of mercury to the ton is expected. The best fields are in Montgomery and Clark counties.

Armenian S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Armies of the World. Two highly successful campaigns in 1939 definitely set the latest type of army. The first was Franco's Catalonian campaign. The second was the German campaign in Poland. In both, skilful use of aviation, mechanization, and motorization in combination with the older type of infantry, field artillery, cavalry, and transport enabled swift and powerful blows to be given in such rapid succession that decisive victory for Franco and the Germans and defeat for the Catalonians and the Poles was the result.

Both campaigns proved that the power of aviation, mechanization, and motorization is not at its highest except when supporting the older arms. In other words, the new methods based on the gas engine do not replace the old but must be used in conjunction with them.

Lessons learned by the Germans in Spain were put into practice on a greatly increased scale in Poland. This because in battle on land and in the air in Spain, Germany was able to test tactical theories and armament evolved in peace and therefore possibly not correct in war.

The lessons learned in Spain by the Italians were the basis of the reorganization of their army. The quick conquest of Albania by Italy was possible because of these lessons. On a much smaller scale it was the same type of campaign as the subsequent German one in Poland.

The French Army, while fully aware of all these changes, considers the main problem for its home or Metropolitan army that of attack and defence on their limited, highly fortified on both sides, German frontier. The problem of war on the Italian frontier only differs in that the fighting would be in the Alps. It would still be a war on a narrow front along a frontier fortified on both sides, each backed up by a densely populated modern nation. The Alpine troops of various kinds maintained on this frontier are trained, equipped, and armed to handle the special problems resulting from mountain warfare both in summer and winter. The consequence is that the French Metropolitan army is trained, equipped, armed, and led to fight the heaviest kind of determined combat.

The Colonial army and the Army Corps of the Metropolitan army which comes from Algeria are trained, armed, and equipped to fight anywhere, with special emphasis on what is necessary to fight the natives of Africa and the Italian Army in Libya.

The British Regular Army is organized primarily to furnish a system of reliefs for the garrisons maintained overseas. Its equipment, armament, and training has been varied to suit the type

GERMAN TROOPS in bunkroom of Siegfried line

of war in which the greater part of it was engaged in at any time or expected to be engaged in next. Since the war of 1914-18 the belief in mechanization and motorization as the best means of meeting its varied problems has steadily grown. The Territorial Army, made up of volunteers and quite similar in many respects to the National Guard of the United States, was originally intended as a home defence force. However, in the war of 1914-18, it was used anywhere abroad needed. In 1939, it furnished the greater part of the anti-aircraft defence within Britain. It also is organized into a number of infantry divisions. Just before the outbreak of the European war its strength was doubled. Up to the end of 1939 its infantry divisions had not been sent abroad. The probabilities are that as the war continues they will be used anywhere British troops may be sent. In the World War, 1914-18, a third force called Kitchener's New Army was raised, at first by volunteering. Numerous new infantry divisions were organized from this force. They were available for service anywhere the Regulars could be used. In the World War Britain gradually came to conscription.

Shortly before the European war broke out, conscription was adopted in Britain. However, due to lack of training facilities, the majority of those registered were not called for service. The plan was to call 20,000 every two months for six months' training and service. Since the outbreak of war the calling up has been slightly speeded up. However, the majority are still (Jan. 1, 1940) only being registered, but not called for service. Up to the end of 1939 no new infantry divisions were organized from these conscripts.

The Spanish Civil War produced one more army and air force which must be taken into consideration in making any estimate of the European military situation. The Nationalist side came out of the war with a first class army of from 900,000 to 1,000,000 Spaniards and an air force of approximately 600 Spanish aviators. While the peace-time army of Spain is considerably below this

figure, it is an army well trained in modern combat, well led by experienced officers, and fairly well equipped and armed. The plans are to give it the most modern equipment and armament. Its leaders fully appreciate the strategical importance of the Spanish peninsula in all land, sea, and air military problems of Europe.

After considerable experimentation, the United States in 1939 decided upon a new type of infantry division for the Regular Army. Instead of the four infantry regiment division formerly standard the new division has three infantry regiments. The old division into two infantry and one artillery brigade is abolished, there now being no brigade organization. The National Guard Divisions are to keep the old organization of two brigades of infantry and one of artillery, each infantry brigade consisting of two regiments of infantry. The number of infantry support weapons, such as mortars, light machine guns, and anti-tank guns, is increased. The infantry is to be armed with the 30 calibre semi-automatic rifle instead of the old non-automatic rifle; 50 calibre machine guns have been added to the armament.

The total personnel of this division being smaller than that of the old, it can be transported more readily by motor transport. Despite this reduction in personnel, its total fire power of all types per infantry soldier is greater than the fire power per infantry soldier of the old division.

The Japanese Army, as a result of its campaign in China, has made two important changes in its organization. Like the United States Regular Army, it has changed its infantry division from a four-regiment one to a three-regiment one. It has considerably increased the amount of horsed cavalry.

Aeroplanes and Tanks.—During the World War the best type of weapons to be used against aeroplanes and tanks was not developed. Above all the necessary type of range finding and sighting apparatus did not exist. The backbone of the new German Army is the infantry. Each infantry division has, however, a far greater proportion of anti-aircraft and anti-tank weapons of all types as well as artillery than has ever before existed for the same number of infantry. It might be said that the infantry of a German division marches and fights surrounded on the ground and in the air by a hemisphere of fire. In fact, the development of fire by modern, well equipped, well trained, and well led infantry and artillery is so great that tanks need the assistance of this fire if they are to attack successfully.

In general the mission of aviation on land is:—first, when the opposing nations are close enough to make air raids, to delay mobilization and concentration of the enemy's army, and to destroy war factories and supply centres; and second, to use its great powers of surprise attack to aid its own army on the ground. While deliberate attacks on civilian population with the intent of breaking a nation's morale are possible, such use of an air force is generally considered, aside from humanitarian grounds, of far less military value than the two purposes given above.

Besides aviation and tanks, the motor has caused three other changes in armies. One is the partial substitution in the cavalry of armoured cars and light speedy tanks for horses for reconnaissance and cavalry screen (to check enemy's reconnaissance groups from getting information concerning main body of the army) work. Two is the substitution of tractors for horse teams to haul the heavier field artillery. Three is the transport of not only ammunition and supplies, but whole divisions complete by motor transportation. This motorization will permit even more drastic changes in strategy than those produced by the use of the railways on a large scale first in the American Civil War of 1861-65 and secondly by Von Moltke in 1870.

Germany considers the motor of such importance that she has appointed a dictator for the motor vehicle industry and decided that all motor vehicles manufactured will be built from the

point of view of their usefulness for war purposes.

Chemical Warfare.—Gas remains as during the World War a weapon of secondary importance. Up to the present there is nothing to justify the fear of its use to cause widespread destruction.

Specialists.—The constantly increased proportion of automatic weapons, of guns of all types, of mechanization and motorization and the considerable number of men on the ground needed to maintain planes in the air have greatly increased the proportion of specialists in all armies. In some countries the shortening of the term of service to 18 months or one year has had to be compensated for by an increase in the number of career or professional soldiers, if the training was not to deteriorate.

Military Service.—In all countries of any importance except the United States, the British Empire, and China, the army is raised by universal service. In the United States the armed forces are raised by voluntary enlistment. While Britain has adopted conscription, up to the end of 1939 the majority of her forces was raised from volunteers. In China the different generals raise their own forces. For some years General Chiang Kai-shek has been trying to insure uniformity of training and equipment and to bring all generals under control of the Central Government. He has been, however, only partially successful.

The length of active service in the universal service armies varies from 65 days for Swiss infantry, engineers, and foot artillery and but one month's training for probably 25% of the Russian army, to an average for most armies of two continuous years

THE FIRST BRITISH CONSCRIPTS, called up July 15, 1939, get their clothing supplies at Surrey barracks, Kingston

followed by various short periods from time to time while in the reserve. As the number of young men physically fit for military service each year in most countries exceeds the number which can be trained in the standing or active army, this excess is generally given short periods of training from time to time. This is particularly true in Russia. It is their basis for claiming a far larger number of trained reserves than those possessed by any other country. On the outbreak of war the trained reserves are used:—one, to bring the standing army to war strength; two, to mobilize new units made up of reservists; and three, to replace casualties. The British Army service includes both active and reserve service. The U.S. Army has begun to raise a reserve. Its strength is (Jan. 1, 1940) but 25,000 (approx.) and therefore insufficient to raise the Regular Army much less the National Guard to war strength. It has an Officers' Reserve Corps of 100,000 (approximately).

Germany's available trained reserves were considerably increased in 1939. First, because it was four years after she restored conscription. Second, because the annexation of Austria made available such men with military training as lived in Austria. Third, because the annexation of Czecho-Slovakia made available the reservists in those regions who had done their active service in the Czecho-Slovakian army.

In Italy, Germany, and Japan boys and young men are given a certain amount of training before they reach the age of military service. In the United States besides private and State military schools, there are limited courses of military training in a number of colleges and each year camps at which a relatively small number of boys receive one month's training without obligation of service. In Britain there are Reserve Officers' Training Corps in a number of schools. In the U.S. the National Guard, a volunteer civilian military force, is armed and equipped and partially trained by the National Government. In Great Britain there is a similar force called the Territorials.

In Germany, besides the professional army, there are partially trained Black Shirts (12,000 are well trained and equipped), Brown Shirts, Technical Emergency Help Corps, and a number of other Nazi-uniformed bodies. In Italy the Fascist militia which is partially trained has part of its force on active duty. In addition there are railway, port, forestry, highway, anti-aircraft, coast defence, and other militias.

Infantry.—The infantry division remains as during the war of 1914-18 the basic unit of all armies today. When that war broke out the standard type of infantry division consisted of two infantry brigades, each of two infantry regiments in turn composed of three battalions—of from 800-1,000 men. Each battalion was made up of four rifle companies. While the number varied somewhat, 36 field guns to 10,000-12,000 infantry or 1-33 guns per 1,000 infantry could be taken as an average proportion. During that war increasing difficulties in finding sufficient replacements for existing infantry units, coupled with the necessity of finding the personnel for the great increase in the proportion of machine guns to rifles, the introduction of automatic rifles, trench mortars, and anti-tank guns, all led to a reduction in the number of infantry soldiers in most of the infantry divisions of the French, British, and German armies. This was generally accomplished by reducing the division from four to three regiments and each regiment from three battalions of four companies each to three of three companies each. Thus instead of 48 companies of infantry a division had 27 companies—a net loss of 21. As a rule the artillery per division of infantry was not decreased, with the result that the proportion of artillery to infantry increased. As the amount of Army Corps (two or more infantry divisions to an Army Corps) and army (two or more Army Corps to an army) artillery steadily increased, as did the artillery directly under the

commanding general of each national army, the proportion of artillery to infantry was greatly increased.

Post-war developments have steadily tended to increase the proportion of automatic weapons and guns of all types which now include all types of mortars, anti-tank and anti-aircraft weapons as well as field guns and howitzers. Thus to prevent the infantry division from becoming too cumbersome to be handled as a unit by the commanding general, a reduction in the number of infantry riflemen had to be made. The U.S. army has begun to arm every rifleman with a shoulder automatic. This increase in fire power of the individual soldier permits a reduction in numbers in a unit without reducing the fire power of the unit. The increasing use of motor transport to move the division also made a reduction advisable. Various methods of reduction have been advocated. A continuation of the war division of three regiments of infantry each of three battalions of three companies each is one method. Infantry battalions of four companies each but with a lesser number of men per regiment is another.

France, Germany, Russia, and Japan have suppressed the infantry brigade. The United States has done so for its Regular Army but not for the National Guard. Each has three regiments of infantry to the division, except the U.S. National Guard Divisions which still have four. Great Britain from the days of the Cardwell reorganization has used a battalion instead of a regiment as the tactical unit. Four battalions grouped together constitute a brigade. It is commanded by a colonel with the temporary rank of brigadier general. Three of these brigades constitute an infantry division. Experiments as to infantry organization are being carried on in Britain. In Spain the usual organization for a division is three groups, generally called demi-brigades, each of four battalions. In practically all armies the infantry regiment is now of three battalions. In the U.S., French, German, Italian, and Russian armies there are three rifle companies to a battalion. In the British, Japanese, and Spanish armies there are four. A division of 10,500 is the strength in most countries. Germany has but 8,400.

Artillery.—The proportion of rifles and light and heavy machine guns per 1,000 infantry soldiers varies. Japan has the highest number of rifles, 628, and France the lowest, 277; Germany the highest number of light machine guns, 38.6; Russia the highest number of heavy machine guns, 15.8, and Japan the lowest, 6.5. Germany leads with by far the greatest number of close support weapons for the infantry; such as mortars, small calibre light guns, howitzers, anti-tank guns. Per infantry division the total is around 231. Most other countries average under 100. Russia has but 39. However, each Russian infantry regiment has 6-76-mm. field guns assigned to

it. This makes 18 guns in addition to the divisional artillery, or a total of 57.

The divisional artillery consists of one or more regiments of artillery except in the British army where there is no regimental tactical organization—the three battalions being organized into a brigade which is the equivalent of a regiment in other armies. Where there is more than one regiment the artillery is organized into a brigade. The regiments are of two to four battalions of two or three batteries each. Batteries are of three, four, or six guns, four being the more usual number.

The divisional artillery consists of both guns and howitzers. One of the questions under discussion in various armies is whether it is better to have only guns and light howitzers with the infantry division, the heavy howitzers being with the Army Corps artillery and sent to the divisions when needed, or to have the heavy howitzers an integral part of the divisional artillery. The light guns are around 3in. in calibre and the heavy from 4in. to 4.5 inches. The light howitzers are around 4in. or 4.3in. in calibre and the heavy around 6 inches. The number of artillery pieces per 1,000 men in the division varies from 2.46 in the Japanese army to 3.49 in the German army.

There are two new tendencies in the artillery armament of today. One is a tendency to increase the number of light weapons of less calibre than the 3-in. in close support of the infantry; that is, anti-tank guns, anti-aircraft guns, trench mortars, mountain guns, and light howitzers. This, while at the same time increasing the number of guns and howitzers of a greater calibre which lend more distant support than the range of those around 3-in. calibre

Military Forces of Nations of the World as of November 1, 1939

*The National Guard has a strength of 235,000. Trained reserves in the strict sense consist only of 25,000 enlisted men and 100,000 officers (both figures approximate). The R.O.T.C. and C.M.T.C. are not included in these figures because there is no obligation to serve. †Urban police.

will permit. In other words, to put in close support of the infantry artillery weapons which offer a smaller target than do the ordinary field guns of around 3-in. in calibre, while at the same time having the benefit of the greater fire power of calibres which offer too much of a target to be used in as close as those around 3-in. in calibre.

The other tendency is to evolve guns with mounts which will permit them to be used for more than one purpose. That is, to have anti-tank guns which can also fire on aeroplanes and infantry, and to have anti-aircraft guns of greater than 3-in. calibre which can be used for ground targets as well.

Germany is leading in both of these tendencies. The 77-mm. gun which was formerly the main artillery armament of her infantry divisions has disappeared from these divisions. They are still used, however, in the armoured motor divisions. The artillery of a German infantry division today is armed with 105-mm. howitzers, for close support of the infantry with its trench mortars and light anti-tank and anti-aircraft guns, and 150-mm. howitzers and 100-mm. guns for more distant support.

Germany has today an 88-mm. anti-aircraft gun which can be used not only against aviation but also for fire against trenches and batteries on the ground.

Mechanized Forces and Cavalry.—Since the war of 1914-18 there has been a great deal of discussion and experimentation with respect to the organization and armament of mechanized forces and whether or not they could replace horsed cavalry and the old type of infantry division on foot with its accompanying horsed artillery. While the organization of the mechanized forces varies considerably in different armies and is still being changed in some of them, the Sino-Japanese War, the Civil War in Spain, and Germany's quick suppression of Poland indicate three fundamental principles:

(1) Mechanized forces are not independent forces, but are primarily for use in conjunction with motorized infantry and artillery and horsed cavalry, all supported by aviation.

(2) Horsed cavalry cannot be replaced by mechanized forces. The limitations of mechanized forces very often correspond with the powers of cavalry and vice versa. In other words, the best results are gotten by a combination of horsed cavalry and mechanized forces.

(3) The infantry on foot with its accompanying horse-drawn field artillery is still the backbone of any force to be used in heavy combat. This is not changed by transporting it in motor trucks when they are available any more than it was changed when railways were first used for transport purposes.

The Germans have two types of mechanized division—the Light Division and the Panzer or Armoured Division. The Italians also have two: the Celeri or Light Division and the Corazzata or Armoured Division. In each case the Light Division includes the lighter mechanized troops, such as motorcycle infantry and machine guns, light tanks, and motorized infantry, while the mechanized division consists of tanks, artillery, and various auxiliary arms and services (*see* LIGHTNING WAR).

In the French Army there are two types of cavalry divisions. The first is the Cavalry Division and the second the Light Mechanized Division. The Cavalry Division consists of two brigades of horsed cavalry, a regiment of artillery and various motorized units including anti-tank guns. The Light Mechanized Division is made up of a regiment of armoured reconnaissance cars, two light mechanized brigades, motorcycle troop, motorized anti-tank guns, motorized artillery regiment, and various motorized services.

Japan in her war in China and Franco during the Spanish Civil War, found it necessary to considerably increase the number of horsed cavalry regiments. The Germans have recently decided to increase their horsed cavalry. The Italians have at all times maintained their horsed cavalry. The Polish cavalry failed in the campaign against Germany because it was not equipped with modern armament nor supported by mechanized forces and aviation. Russia has about 23 horsed cavalry divisions. She is also reported to have 6 mechanized divisions. Great Britain has 2 inde-

pendent mobile divisions, 12 mechanized and 2 horsed cavalry regiments. The Japanese Kwantung army is motorized and mechanized, but the details are secret.

Army and Navy Air Forces.—In the United States and Japan, the army and navy each have their own air forces. In other countries the air forces are independent of the army and navy except that in Russia the land forces, air force, and sea forces are all parts of the same organization. The tendency is toward the U.S. and Japanese system as more and more the pilots of independent air forces assigned for duty with the navy remain with the navy.

Fortified Lines.—(*See* MAGINOT LINE; SIEGFRIED LINE.) The Swiss have built a fortified line from Basle to Lake Constance. There are numerous reports that Russia is engaged in constructing fortified lines along her western or European frontier and her eastern Amur river frontier. It is reported that Rumania has built on her Russian and Hungarian frontiers fortified lines, known as the King Carol Line. The various sections of the fortified line on the former Czecho-Slovakian frontier with Germany are now in German hands as a result of the annexation of that country. (*See* also AIR FORCES; CHEMICAL WARFARE; EUROPEAN WAR; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR; MARINE CORPS; MUNITIONS OF WAR; NATIONAL GUARD; NAVIES OF THE WORLD; SPAIN, CIVIL WAR IN.)

Arosemena, Juan Demostenes (1879-1939), Panamanian statesman. After completing his education he worked with a railroad construction company in Ecuador and upon his return to Panama was a departmental chief in the ministry of war and navy, and in the ministry of public instruction and justice. In 1906 he was secretary of the National Assembly and two years later high court judge of the republic. He became governor of Colón province in 1922 and thereafter held several portfolios in Panamanian cabinets. He was elected president of Panama in 1936 and served in this office until his death. President Arosemena died December 15 at Penonome, Panama.

Art: *see* AMERICAN LITERATURE; ARCHITECTURE; PAINTING; SCULPTURE; FAIRS AND EXHIBITIONS; etc.

Art Exhibitions. In the United States art events at the two fairs created widespread interest. San Francisco's Golden Gate Exposition featured Pacific Cultures, Contemporary Art, and Masterworks of Five Centuries. Among the latter, the Royal Italian Government loans were later seen at the Art Institute of Chicago. The New York World's Fair presented Masterpieces of Art and American Art Today.

Many attractive exhibitions centred about a general topic. Eight New England museums, comprising Andover's Addison Gallery of American Art, Boston's Museum of Fine Arts and Institute of Modern Art, New Haven's Yale Gallery of Fine Arts, Cambridge's Fogg Art Museum, and the museums of Worcester, New London and Providence joined in showing various aspects of New England art. Sources of Modern Art were revealed at the Institute of Modern Art in Boston. Life in America was illustrated at the Metropolitan Museum of Art. Artists Unappreciated in Their Day came into their own at the Toledo Museum of Art. Hunting

and racing subjects were viewed at the Baltimore Museum of Art. Mention should also be made of Classics of the Nude and Views of Paris at Knoedler's, French Sculptors of the 17th, 18th, and 19th Centuries at Seligmann, Rey and Company.

Particular periods were emphasized in the Whitney Museum of American Art's 20th Century Artists; in the Worcester-Philadelphia Exhibition of Flemish Painting; in Detroit's Pre-Columbian Art of Mexico, Central America, and Peru; in the Metropolitan's Augustan Art; in the Schaeffer Galleries' 17 Masterpieces of the 17th Century.

Deserving attention among the usual annuals and biennials were Pittsburgh's Carnegie International, perhaps the last for some years, with a fine American section; Cincinnati's 46th Annual of American Art, one of the largest in its history, and the Chicago Art Institute's Half a Century of American Art.

The work of William Blake was celebrated at the Philadelphia Museum of Art. Despiau and Maillol shared honours at Boston's Institute of Modern Art. New York's Museum of Modern Art commemorated Forty Years of Pablo Picasso (in collaboration with the Art Institute of Chicago). Notable 19th and 20th century painters displayed by dealers included Jongkind at Carroll Carstairs', Newman and Ryder at Knoedler's, Renoir at Durand-Ruel, Iacovleff at the Grand Central, Eilshemius at the Kleemann Gallery.

Europe was the scene of many important art events, from the Prado Masterpieces at Geneva to Scottish Art at Burlington House. Swiss art through the centuries appeared at the Kunsthau, Zürich. In Holland the Art of the Early Middle Ages was shown at Utrecht, French sculpture of the 19th century in the Stedelijk museum, and the Bible in Dutch Art in the Rijks museum, Amsterdam. France observed the 150th anniversary of the French Revolution with exhibitions at the Musée Carnavalet and at the Orangerie in Paris, and at Versailles. Other worthwhile Paris exhibitions ranged from the Salon of Contemporary Sculptors, James Ensor at the Galerie de la Gazette des Beaux-Arts, Cézanne at Paul Rosenberg's, Georges Michel at Guy Stein's, to the Masterpieces of the Museum of Montpellier at the Orangerie and the Ballets Russes de Diaghilev at the Musée des Arts Décoratifs. Italy staged numerous outstanding shows: Leonardo, in Milan; Veronese, in Venice; the Medici exhibition, in Florence; Pordenone and Renaissance Painting in Friuli, in Udine; Brescian Renaissance Painting, in Brescia; Gothic and Renaissance Art in Piedmont, in Turin; 15th Century Sienese Sculpture in Siena. Belgium rendered homage to Hans Memlinc, in Bruges, and in

ALL EXHIBITS of the Tate Gallery, London, were securely packed and shipped to undisclosed centres, safe from air raids, in the last week of Aug. 1939

Liège arranged an exhibition built about water as shown in the art of all periods and countries. Germany showed ancient Japanese art, in Berlin; Old German Art in the Danube Region, in Vienna; Hans Thoma, in Karlsruhe. (D.O.)

Art Galleries and Art Museums. The year 1939 closed the decade in a magnificent manner for art galleries and museums and for those of the United States of America in particular. For the first time a number of the most universally celebrated masterpieces of art from Europe crossed the water and were enjoyed by millions of Americans in their own country. Important new museum buildings were in the process of construction and others were dedicated. Political conditions in Europe made it possible for the superb and unique masterpieces from the Prado Museum in Madrid to be seen in Geneva, Switzerland, before their return to Spain. In spite of the dread of war since Munich of 1938, very significant exhibits were put on in Europe in 1939, notably the exhibition of Veronese in Venice, the exhibition of the Medici in Florence, and the superb exhibit of Leonardo da Vinci's works in Milan—in which were displayed fascinating full-sized working models of his inventions made from his drawings.

The war clouds which settled over Europe early in September saw the nations rushing frantically to save the priceless essence of their past civilizations, their wealth of art treasures. This brought forcefully to the minds of everyone in the world the great value of art to mankind. Museums the world over are pitifully vulnerable to bombing from the air, and museum architecture of the future must provide means to protect works of art from attack.

The citizens of the United States of America were particularly fortunate in that great masterpieces from Europe were on view in two World's Fairs. The New York Fair showed two significant art exhibits; one, Masterpieces of Art, including loans from Europe, two, a regional exhibition of contemporary American art in which the attempt was made to select representative examples by regional juries of artists. The San Francisco Fair held several outstanding exhibits; an old master exhibition for which most important examples of painting and sculpture were allowed to leave Italy for the first time: Botticelli's "Birth of Venus," Raphael's "Madonna of the Chair," an original work by Michelangelo, and others. This remarkable collection was shown at the Art Institute of Chicago after the close of the Fair and met with great popular acclaim. Work by North American Indians at the Exhibit of Pacific Cultures at San Francisco proved for all time the depth of feeling and unusual ability of that race. The Half a Century of American Art Exhibition at The Art Institute of Chicago made a valuable contribution to American art in a survey comprising examples it had exhibited from 1888 to 1938. A remarkable loan exhibition of Flemish art was held at the Worcester Art museum and at the Philadelphia Museum of Art. A memorial exhibition of the work of the important American artist and teacher, Kimon Nicolaïdes, was held in New York in March.

Modern art was dignified by the new building of the Museum of Modern Art in New York which opened on May 10, giving increased quarters for the very important service which this organization has rendered for a decade to the public of the United States. About the same time, on June 20, Hitler was branding modern art as "degenerate" by selling the modern masterpieces from German museums at auction in Lucerne, from which sale many significant works passed into museums and collections in the United States and Europe. The Fogg Art museum, Harvard university, gave a \$2,000 fellowship for research in modern art. The largest exhibition of Picasso—Forty Years of His Art—was shown at the Museum of Modern Art and will be on view at the

Art Institute of Chicago in 1940. The architectural competition for the new Smithsonian Gallery of Art, Washington, D.C., was won by Eliel Saarinen, Eero Saarinen and J. Robert F. Swanson.

Samuel H. Kress gave his collection of 375 Italian paintings and sculptures to the United States, to be installed with the Mellon collection in the National Gallery of Art (the building for which will be completed in 1940). The new Allerton Wing, a handsome gift of Robert Allerton, provided the Art Institute of Chicago with ten new galleries in the Decorative Arts Department, allowing a rearrangement of objects.

The State Department of the United States held a conference on Inter-American Relations in October in which the field of art was discussed and closer co-operation between the North and South American republics encouraged.

In the British Isles the new gallery of art at Southampton forms part of the civic centre. The Drapers' Wing at the Ashmolean museum at Oxford was opened. The Scottish Royal museum dedicated a new gallery of Oriental Art in modern museum design. Roman antiquities were displayed in the new museum at Cirencester. In Grahamstown, South Africa, a new museum was opened. In France, the town of Chartres inaugurated the new museum in the old episcopal palace. At Besançon a committee was formed to acquire the birthplace of Gustave Courbet at Ornans to convert it into a museum. At Dortmund, Germany, the collections of the popular art of Westphalia were rearranged. In May the Nationalgalerie in Berlin organized an exhibition of art and artistic life in the territories newly acquired by Germany. The art world suffered a distinct loss with the death of Max Doerner, Professor of the Academy of Fine Art in Munich, the author of *The Materials of the Artist*, a classic in the study and technique of picture making.

In Greece, the Zygomalas museum at Salessi, a village of Attica, showed peasant embroideries. In Moscow two exhibitions were held: that of Socialist Industry in April; and in the State Museum for Modern Western Art an exhibition of modern French landscape painting. In Japan the new Imperial museum of Tokyo was installed in a recently constructed cement building in oriental style. In Sweden, the Linköping museum was opened—one of the most modern museum buildings in Sweden; and the new Zorn museum in Mora, containing a reproduction of Zorn's Stockholm studio, was completed. El Museo de Indias in Madrid was created to take care of American antiquities in Spain, stressing literary and artistic documentation of the colonial epoch. In South America the National Museum of Peru at Lima published one of a series of unusual notebooks on Peruvian art. The Museo Nacional de Bellas Artes at Buenos Aires re-opened at the end of May.

(L. B. BR.)

Arthritis. The discovery of a spontaneous infectious polyarthritis in the rats of Java, presenting exceptional features of parallelism with chronic rheumatoid arthritis in man, by Collier and his colleagues, offers promise of yielding information of practical importance. Indeed, the disease can be transferred to normal rats by injecting arthritic exudates from the diseased animals. The lack heretofore of an experimental animal with a natural disease similar enough to that existing in man has severely hampered certain aspects of research. A progressive proliferative polyarthritis, bearing a clinical and pathologic resemblance to human rheumatoid arthritis has also been produced experimentally in mice by filterable, pleuropneumonia-like microorganisms recently isolated from the brain of a normal mouse by Sabin and co-workers which may also contribute to experimental observation.

Other studies on viruses in fibrositis and arthritis in man and animals have been reported by Gordon, by Dyson, and by Eagles.

GLASS FAÇADE of the Museum of Modern Art, opened May 10, 1939, at New York city

The ubiquitous streptococcus and its possible relation to arthritis continued to engage attention, especially by Cecil and Angevine, and by Gibson.

The joint fluid and joint tissues have received additional study during the past year. A tendency to differentiate more between different stages of the same process, between the same process in different joints, and between the membranes of the same joint in different locations has become evident.

Environmental factors as they affect the clinical course of rheumatoid arthritis have been studied by Cobb. By listing in parallel columns the exacerbations and remissions of the arthritic symptoms and the social data, a relationship was shown between environmental stress, especially poverty, grief, and family worry, and the onset and exacerbations of rheumatoid arthritis. This is apparently the first really controlled factual study of the subject.

Vaccines again have been rather convincingly condemned as routine instruments of treatment, especially by the report of Sidel and Abrams. The value of sulphanilamide in gonorrhoeal arthritis and its uselessness in rheumatoid arthritis has been confirmed by Coggeshall and Bauer's careful study. Abrams and Bauer evaluated the effect of massive doses of Vitamin D on 18 patients with rheumatoid arthritis, concluding that this method of treatment is of little or no value in altering the course of the disease. Colloidal sulphur in the treatment of the disease has been rejected by the Council on Pharmacy and Chemistry of the American Medical Association, with the conclusion that it may have some value in affording temporary symptomatic relief in some form of arthritis but that its toxicity, indications, and contraindications are not defined. Freyberg and his colleagues studied sulphur metabolism and the effect of sulphur in rheumatoid arthritis, concluding that there was no biochemical or metabolic need for or benefit from sulphur medication in rheumatoid arthritis. Additional studies of gold therapy have indicated its effectiveness in some instances but have continued to disclose high toxicity. There have been some promising papers on the local treatment of certain joint disorders by infiltration with a local anaesthetic, as has been principally recommended by Leriche and his associates in France.

Art Sales. Among American sales, that of the property of Goodall and Hepburn, at the American Art Association-Anderson galleries, realized \$51,755. Stuart's "Portrait of Commodore Barry" was purchased for \$30,000 by the Macbeth galleries. At Parke-Bernet's, the fourth Hearst auction reached a total of \$227,000; Gustave Oberlaender's collection produced a total of \$98,940. With the close of the 1938-39 auction season a summary of the activities at these galleries showed total purchases amounting to \$2,417,330. The late Mrs. Cornelius J. Sullivan's collection was also dispersed by Parke-Bernet and a total of \$148,730 was reached in the two night sessions. The top price, \$27,500, was paid by Walter P. Chrysler for Cézanne's portrait of his wife. Van Gogh's "Portrait of Mlle. Ravoux" attained the sale's second highest of \$19,000.

Despite the war's outbreak and the uncertainty preceding it, the London season was lively. At Christie's further art treasures of Hearst reached a total of £11,497. The Christie sale in aid of Lord Baldwin's Fund for Refugees resulted in £15,647 for the 386 lots sent in. A first portion of Dr. Pringsheim's renowned Italian majolica was auctioned at Sotheby's. Two days produced £12,061, although prices were often disappointing. The highest was £370 for a 15th century Florentine "oak-leaf" jar. At Christie's, Whistler's "At the Piano" from Sir Edmund Davis's collection went to Stevenson Scott for £6,405, the highest price for Whistler in a London auction. The first owner had obtained it in 1860 for £30. Exhibited, after the London auction, at Scott and Fowles in New York, the picture was snapped up by a prominent American collector. The sensation of the season was Christie's auction of a newly discovered work by Pieter Brueghel, from the late Mrs. Frank Holbrooke's collection. Bought by Holbrooke for £700, it went to Colnaghi for £8,190 (the highest price paid in an English auction for Brueghel). At Sotheby's, Goya's "Portrait of Doña Zarate" was acquired by Knoedler for £6,800, a record price. Clarence Mackay's arms, armour, and works of art totalled £21,936 at Christie's.

An event of the summer was the sale by the Fischer gallery in Lucerne, Switzerland, of paintings and sculptures by modern masters from German museums.

In Paris a Cézanne landscape, "Le Pilon du Roi Vu de Bellevue," drew 542,000 francs. "Les Deux Soeurs" of Renoir brought 330,000 francs. Two landscapes by Bonnard were knocked down for 75,000 and 46,000 francs. (D. O.)

Asbestos. World production of asbestos increased to a new high record of about 600,000 tons in 1937, declined sharply in 1938, but rose again in 1939. Asbestos is largely of British origin, since 90% of the 1929 output and 77% of that of 1937 was mined in the British Empire. In 1937 Canada supplied 61% of the world total, Southern Rhodesia 9%, South Africa 4% and Cyprus 2%; the only large producer outside the Empire was the Soviet Union, with 20% of the 1937 total, increased from 7% in 1929. The United States consumes about one-half of the world supply but has only a minor output, which, however, has increased nearly four-fold during the past few years, reaching 12,600 tons in 1937. United States imports increased in 1937 to 249,000 metric tons, but dropped to 14,500 tons in 1938.

Preliminary estimates for 1939 are 300,000 tons for Canada, 53,000 tons for Southern Rhodesia, and South Africa 22,000 tons. (G. A. Ro.)

Ascension: see BRITISH WEST AFRICA.

Asia: see AFGHANISTAN; CHINA; INDIA, ETC.

Asphalt. More than half of the world supply of native asphalt comes from the famous asphalt lake of Trinidad: the bulk of the remainder is divided between Egypt and the United States, with possibly 10% distributed among several minor producers. A number of countries, with the United States in the lead, produce considerable quantities of asphaltic or bituminous rock, carrying usually less than 10% of true asphalt. The largest item, however, is petroleum asphalt, of which there was produced in the United States in 1938 some 5,794,000 short tons, 73% from domestic petroleum, and 27% from foreign. As compared with this, the domestic production of bituminous rock was 483,500 tons, and native asphalts only 28,650 tons. Production in Trinidad declined by more than half in the past decade, to 111,965 long tons in 1936, recovering to 145,900 tons in 1937.

(G. A. Ro.)

Assassinations. A list of assassinations, actual or attempted, during 1939 includes:

Feb. 20 Tcheng Loh (Ch'en Lu), foreign minister in Japanese puppet Gov't at Nanking, shot to death by 20 Chinese assassins in Shanghai.

April 4 Mosul, Iraq. George E. Monck-Mason, British consul, slain by mob after report that King Ghazi, killed in a motor car accident, had been assassinated by Britons.

Sept. 21 Bucharest, Rumania. Premier Armand Calinescu slain by six members of Fascist Iron Guard. The new Rumanian Gov't, headed by Gen. George Argesanu, ordered execution of hundreds of Iron Guardists and imprisonment of others in reprisal.

Nov. 8 Munich, Germany. Apparent attempt to assassinate Adolf Hitler and high Nazi leaders failed when they left Buergerbraeu hall shortly before time bomb exploded; 8 were killed.

THE ASSASSINS of Premier Armand Calinescu were executed on the site of their crime in Bucharest Sept. 21, 1939, and left lying in the street for 24 hours

Asthma: see ALLERGY.

Astronomy. The dedication of the McDonald observatory in Texas contributed much to the progress of astronomy in 1939. The 82-inch reflector, attested by experts to be one of the finest, has in the first few months of its operation made possible notable discoveries and contributions in the field of spectrographic astronomy, of particular interest being the discovery by Kuiper of several new white dwarf stars. The dedication in May was celebrated with a seminar on galactic and extragalactic structure in which a considerable number of the foremost astronomers and physicists of North America and Europe participated.

Solar System.—The Sun. An investigation of the complexity of form and motion of solar prominences by McMath, based on the great wealth of material obtained by him with the spectroheliokinematograph, appears to prove conclusively that the observed motions are actually motions of material, and that the sudden accelerations observed by Pettit and others are real. No satisfactory theory has yet been offered to explain these complex motions. The projected expansion of the observational procedure to give simultaneous observations in three dimensions will add much to this study.

The influence of the absorption of water vapour on solar radiation was investigated by Adel in the spectral region 8.34μ to 13.40μ . The absorption co-efficient, which describes the degree of opacity produced by water vapour in this spectral region, was then applied to determine the form of the solar energy curve in this region when unaffected by water vapour absorption. Adel finds satisfactory agreement between the experimentally derived form of the energy curve and the black body curve for $6,000^\circ$ or $7,000^\circ$ K.

Planetary System.—An unusual number of comets was under observation during 1939, 13 being discovered. Of this number seven were previously known comets which were re-discovered, whereas the remaining six were, so far as is known, new comets.

The planetary phenomenon which occasioned most interest among astronomers was the close approach of Mars at the opposition of July 28. Though poorly situated for northern observers, many visual and photographic observations were made. Preliminary reports by Slipher and by Wright indicate a number of changes in surface features since previous oppositions, and the series of photographs obtained by Slipher at Bloemfontein show features which have previously defied observation by photography.

A possible explanation of the vivid and varied colouration observed on Jupiter has been suggested by Wildt. It would be an obvious advantage if the various colours could be ascribed to a single chemical principle. The reaction between metallic sodium and both gaseous and condensed ammonia offers such a chemical principle and supplies highly coloured systems, both liquid and solid. Changes in temperature produce changes in colour, and a range of colours adequate to produce the varied colouration observed is produced. The absence of vivid colouration from Saturn's atmosphere is explained by the lower temperature of that planet. The origin of the sodium involved is unknown, but it may come from interplanetary space.

A hypothetical model for the constitution of the giant planets Jupiter and Saturn has been proposed by Wildt to explain the low mean density of these planets. The proposed model consists of three homogeneous layers, namely, (1) a dense core similar in structure to the terrestrial planets, (2) a thick layer of ice surrounding the core, and (3) a layer of highly compressed condensed gases, chiefly solid hydrogen, on top of the ice. Appropriate values of the densities of the three layers make possible the determination of the radii of the surfaces of discontinuity, the values being

LARGEST OF ITS KIND in the world, this camera is being used at Cook observatory, Wynnewood, Pa., to photograph a complete atlas of the heavens

for Jupiter, 0.82 and 0.43 of the equatorial radius, and for Saturn 0.66 and 0.26 of the radius. The abundance of hydrogen and oxygen relative to the metals required by this model is not inconsistent with the relative abundance of these elements in the solar atmosphere as determined by Russell. Of interest in connection with Wildt's hypothesis is the suggestion of Peek that the red spot on Jupiter is a huge berg, perhaps of ice and nitrogen, floating in a liquid outer layer of the planet.

Several observatories which participated in the international program for the observation of Eros in 1930-31 have completed reductions of their observations. These thousands of observations are now turned over to Jones for use in making new determinations of the solar parallax and the mass of the moon.

Stars.—Special Stars and Stellar Structure. Studies of the spectra of Arcturus by Miss Davis and of a selected list of A and B stars by Struve have added new identifications of many lines. An investigation of the spectra of M-type supergiant stars by Spitzer seems to indicate that the atmospheres of these stars are characterized by almost complete lack of thermodynamic equilibrium. Bowen and Wyse have discovered recently predicted forbidden lines of several of the more common metals in the spectra of three planetary nebulae. This discovery removes the chief qualitative differences in chemical composition between these nebulae and the stars. A photographic atlas of spectra of Nova Herculis 1934, compiled by Stratton and Manning, gives an unusually complete record of the spectral changes.

Eclipsing stars have received considerable attention during 1939. Kron's photoelectric observations of YZ Cassiopeiae have yielded a more accurate determination of the degree of limb darkening.

GREAT NEBULA OF ANDROMEDA, photographed at the Cook observatory, which is compiling a complete atlas of the sky

ing than has hitherto been made for any eclipsing star. The darkening co-efficient for the larger star is 0.491 ± 0.038 as compared with Pannekoek's theoretical value for this A₃ star of 0.65.

Russell has made a theoretical investigation of the ellipsoidal figures of close pairs and suggests that, in cases where the masses are known, a theoretical ellipticity factor should be substituted for that obtained from the light curve in making the solution for orbital elements. He concludes that the light curve does not permit differentiation between ellipsoids of different figure and ellipsoids of similar figure but of different dimensions.

SUN SPOTS photographed Sept. 11, 1939, at the U.S. Naval observatory, Washington, D.C.

The "photometric ellipticity" determined from the light curve depends on the geometrical form of the bodies, on limb darkening, and on the variation of surface brightness with gravity. The gravity effect may be studied in this way, but not the figure or the internal constitution.

Eclipsing stars with variable periods have been investigated by Dugan and Miss Wright. Of 28 stars studied with the aid of the Harvard observatory plate collection, 21 have periods surely or probably variable, while the remaining seven probably have constant periods. The Harvard plates made possible the extension of the study over a period of nearly 50 years, which is important in view of the slowness of the changes. It was previously thought that most observed changes of period of these stars could be attributed either to apsidal motion or to light-time across the orbit around a third body. The present work demonstrates that many of these changes are irregular and at present inexplicable, and points the way to a promising new field of investigation.

The eclipsing star VV Cephei, similar to but much larger than ζ Aurigae, consists of a supergiant star of spectral type M₂ and a B-type primary star. Goedicke has made a spectrographic study of this star during its emergence from eclipse, which gave an opportunity for a detailed study of the extensive atmosphere of the M star through the effect on the light of the B star shining through it. The radius of the M star is about 1,200 times that of the sun, the masses of the M and B stars are 47 and 33 times the sun respectively, and the density of the M star is 3×10^{-8} .

Many theories have been proposed to account for the source of stellar energy. Whatever process supplies the requisite energy must involve a transformation of mass into energy, probably by a change of one kind of atoms into another with release of energy corresponding to the change in the total mass. Bethe has explored the possible transformations which can occur under conditions existing in the interiors of ordinary dwarfs, and finds the following chain of reactions possible. C¹² plus a proton gives N¹³ with radiation of energy. N¹³ then loses a positive electron and changes into C¹³ which, upon addition of a proton changes into N¹⁴ with emission of energy. Addition of another proton transforms this into O¹⁵ with further energy emission, the O¹⁵ subsequently losing a positive electron and changing into N¹⁵. N¹⁵ plus a proton might form ordinary oxygen O¹⁶, but Bethe calculates that it is several thousand times more probable that the nucleus would split, giving He⁴ and the original C¹². Thus carbon acts as a catalyst for the transformation of hydrogen into helium. This process will continue at an ever increasing rate until all of the hydrogen has been used. Bethe calculates that this process will supply sufficient energy for the sun at central temperatures of 18 to 21 million degrees, depending on the percentages of hydrogen and nitrogen available. These temperatures, computed from nuclear theory, are in good agreement with the central solar temperature determined from astrophysical data. It appears that the principal source of energy for the main-sequence stars has been found, though the very rapid radiation of the giants cannot be thus explained. A recent investigation, by Greenstein, of the spectrum of ν Sagittarii indicates a higher percentage of helium than hydrogen in this star's atmosphere, which may indicate that this star is already well advanced in the "life history" outlined by Bethe.

Stellar System.—Noteworthy contributions to the study of the structure of our galaxy have been made during 1939. Joy has investigated the velocities of 156 Cepheid variables situated near the plane of the galaxy and well distributed in longitude. Distances obtained from the period-luminosity law were corrected for interstellar absorption. Solutions by Oort's method give for the longitude of the centre of rotation, $325^\circ 3 \pm 1^\circ 3$, and for the rotation effect at a distance of one kiloparsec, 20.9 ± 0.8 km/sec. The

distance of the centre is estimated to be 10 kiloparsecs and the circular orbital velocity of the sun is determined as 296 km/sec with a period of 207,000,000 years.

One outstanding difficulty in the problem of galactic structure, the absorption of starlight by clouds of obscuring matter, has been investigated by Stebbins, Huffer, and Whitford. These observers have measured the colours of 1,332 B-type stars with a photoelectric photometer. From photoelectric measures of various regions of the spectra of a selected group of stars they have determined that the absorption varies inversely as the wave-length. This law of selective absorption leads to values for total absorption in visual and photographic light of seven and nine times the colour excess, respectively. The strongly reddened B stars are all found near the plane of the Milky Way, in the zone in which no extragalactic nebulae are observed. A limit to the absorbing material is found in the direction of the anticentre, where no star shows a colour excess greater than 0.3 magnitude, whereas no such limit is indicated in the direction of the galactic centre. Special studies of three bright regions in the Milky Way show that even these regions are only half as bright as they would appear if no absorbing clouds intervened.

External Galaxies.—Many photographs are now available for the determination of the number and structural form of extragalactic nebulae. However, as Hubble has pointed out, dynamical investigations of these objects are hampered by the scarcity of spectrographic data concerning internal motions. Of particular interest, therefore, is the spectrographic investigation of the rotation of the Andromeda Nebula by Babcock. His results show a nearly constant angular velocity for the outer spiral arms, and an angular velocity indistinguishable from zero in the region of eight to 10 minutes of arc from the nucleus. The core exhibits a period of rotation of about 1.1×10^7 years, whereas the period for the outer arms is about 9.2×10^7 years. It would appear that a large proportion of the mass of the nebula is in the outer regions beyond 20 minutes of arc from the nucleus. The near zero velocity closer to the nucleus may indicate a non-uniform distribution of mass along the radius vector. The Andromeda Nebula and the Galaxy have many features in common, the chief difference previously known being their diameters. A new discrepancy now appears when the nearly constant angular velocity of the outer parts of the Andromeda Nebula is compared with the planetary type of rotation apparent in our Galaxy. Menzies; language, English; religion, Christian (census 1933: Anglican, 2,565,118; Roman Catholic, 1,161,455; Presbyterians, 713,229; Methodists 684,022; other Christians, 603,914).

History.—Two events, the death of the Commonwealth prime minister, J. A. Lyons, and the outbreak of war in Europe, exer-

PHOTOGRAPH OF MARS taken on July 27, 1939, with an "occluding disk" at the U.S. Naval observatory, Washington, D. C., as the planet made its closest approach to the earth in 15 years

cised an important influence upon the course of political developments during 1939. The death of Mr. Lyons on April 7, after seven continuous years of office, left the coalition Government of the United Australia Party and the United Country Party without a leader capable of uniting the discordant elements and of assuaging the latent personal antagonisms within its ranks. Increasing disruption had already led to the resignation in March of R. G. Menzies, attorney-general and deputy leader of the United Australia Party, following the Government's decision to postpone the introduction of its scheme for national insurance; and other resignations were threatening. In the face of this new emergency the governor-general commissioned Sir Earle Page, leader of the United Country Party, to carry on as prime minister until the United Australia Party (the senior partner in the coalition) could elect a new leader. When the United Australia Party showed its confidence in Mr. Menzies by asking him to lead the party the coalition broke down, and Mr. Menzies formed a Government chosen entirely from the United Australia Party. Despite frequent embarrassments the Government was able to continue in office until the adjournment of parliament in June. Mr. Menzies himself took over the Treasury, and entrusted the new Department of Supply and Development to R. G. Casey.

Before parliament assembled again war had broken out. All parties recognized the need for a national united front, and the Government was able to proceed with its defence plans without serious hindrance. Sir Henry Gullett was placed in charge of the ministry of information, and the defence portfolio was subdivided, the prime minister becoming minister for co-ordination of defence; G. A. Street, minister for the army; Sir Frederick Stewart, minister for the navy; and J. V. Fairbairn, minister for air; P. C. Spender was appointed acting treasurer. A war cabinet was set up, consisting of the prime minister, the ministers for the three services, the minister for information, W. M. Hughes (attorney-general and minister for external affairs), and Senator H. S. Fole (minister for the interior).

Foreign Affairs.—Complete identity of views with the Government of the United Kingdom was emphasized by the Commonwealth Government at the time of the Czecho-Slovakian crisis in March, and Mr. Lyons expressed his Government's readiness to co-operate with the United Kingdom Government in its efforts to deal with the international situation. With the approach of the Polish crisis Mr. Menzies reiterated in August Australia's determination to stand by Britain should she be forced into war. On the evening of September 3 the prime minister announced that

Australia was at war with Germany. The Defence Act was immediately proclaimed the over-riding law of the Commonwealth, and special measures for national security were brought into operation.

Military Measures and War-Time Precautions.—As a result of the war the Commonwealth's expenditure on defence during the fiscal year will amount to over £62,000,000. The year 1938's corresponding figure was £14,000,000. Naval personnel increased from 5,000 to 10,000, all ships of the Royal Australian Navy were immediately brought into commission, and a number of fast merchant ships were armed to undertake patrol duties.

By November the Australian Army had about 100,000 men undergoing training, of whom 20,000 formed a special force to be sent overseas for service early in 1940. The district commands for home defence were reorganized, and steps were taken to mechanize the entire army. A most significant event was the reintroduction of compulsory military training for home defence for men between the ages of 20 and 21. Compulsory training was suspended in 1929, but has since remained on the statute book, ready to be brought into operation by proclamation. Mr. Menzies has stated that there will be no conscription for overseas service.

It was announced in September that an air expeditionary force of 3,200 men, consisting of officers, air crews, and ground personnel sufficient to man six squadrons, would be sent abroad for service with the Royal Air Force. Early in November, however, the prime minister stated that, after consultation with the United Kingdom Government, it had been decided to cancel the original plan and instead to send about 200 officers and men to Great Britain immediately to man aircraft already ordered by the Royal Australian Air Force, and to serve as a general reconnaissance squadron with the Royal Air Force.

The new Department of Supply and Development immediately accelerated the manufacture of armaments and war materials by adapting the existing industrial organization to war-time purposes. Government munition factories have been enlarged and annexes set up in a number of private engineering works and railway workshops throughout the country. Plans for aircraft manufacture on a large scale were drawn up even before the war, and the Commonwealth Aircraft Corporation's new factory has already shown itself capable of producing several aeroplanes each week. In addition orders for training aircraft were placed in America.

Public Finance.—The fiscal year ended June 1939 produced a budget surplus of £627,000, revenue showing an increase of £5,500,000 on 1937-38, and expenditure an increase of £8,500,000. Mr. Menzies' budget, introduced a few days after the outbreak of war—the first £100,000,000 budget in the history of Australia—announced substantial increases in income tax, sales tax, and customs and excise duties, necessitated by greatly increased estimates of defence expenditure. On November 30 Mr. Spender, the acting treasurer, introduced a supplementary financial statement, as a result of which estimated defence expenditure for the fiscal year was almost doubled. It was not considered expedient to impose further immediate increases in taxation in view of the extra burdens already announced in September. Instead, Mr. Spender stated that the Government's financial policy would be weighted for the time being towards bank borrowing, with a return to public borrowing and taxation when economic circumstances justified it. Loan expenditure for 1939-40 was estimated at £48,000,000.

Unsettled political and economic conditions adversely affected loan operations early in 1939. Two internal loans, of £8,500,000 in February and £4,750,000 in May, both for public works, were undersubscribed, as was the £6,000,000 defence loan floated on the London market in June.

Economic Affairs.—Primary industries continued to suffer from the decline in export prices which began in the middle of 1937, and which inevitably reacted upon Australia's trade balance. Average

export prices fell by 16.6% from the level of 1938, and the sterling value of exports from £122,900,000 to £108,300,000. Since imports also fell heavily, however, the financial year 1938-39 closed with a favourable balance of £8,800,000. There was some reduction in the volume of London funds, which were particularly high in June 1938, but the investment of capital in Australia from overseas continued. Contracts entered into with the United Kingdom Government for the purchase of Australian export commodities may be expected to have a stabilizing effect on primary industries. Most important was the United Kingdom Government's acquisition of the wool clip for the term of the war and for one season following the cessation of hostilities. Butter, eggs, meat, and wheat also came within the scope of these negotiations. The disposal of surplus stocks of wheat and flour was particularly satisfactory, as the industry suffered severely not only from depressed price levels but also from severe drought conditions experienced at the beginning of the year. The Commonwealth Government acquired the whole of the 1939-40 crop and arranged to finance the growers pending the disposal of the wheat.

The value of flourishing manufacturing industries as a contribution to economic stability was particularly apparent in a year of falling commodity prices. As a result of recent industrial development Australia has achieved a national economy more balanced and less vulnerable to fluctuating market conditions. Though factory employment fell slightly during 1938-39 it still easily exceeded the 1936-37 average, and the demand for skilled workmen remained high. Plans for the establishment of the motor-car industry have proceeded despite the intervention of war, and proposals for the manufacture of tin-plate, aluminium, and bakelite have been put forward. A not unimportant stimulus to industrial development was provided by refugee immigrants, a considerable number of whom were admitted into Australia up to September. The outbreak of war, and with it the Government's growing demands for war material and equipment, naturally gave a decided impetus to secondary industry. By December 8,000 men and women were employed in the manufacture of munitions alone.

Automobile Racing. John R. Cobb, a London fur dealer, made another successful assault upon the world's land speed record to highlight 1939 auto racing activities. He streaked through a measured mile on the Bonneville Salt Flats in Utah at 368.85 mi. per hour. By travelling more than six miles a minute Cobb vaulted back to the world's straightaway speed throne where he had reigned last year for the brief span of 24 hours. At that time Captain George E. T. Eyston surpassed him by attaining a mark of 357.5. Cobb's latest figure of 368.85, made Aug. 23, 1939, was the first to eclipse the existing record made by Captain Eyston. Cobb was driving a 2,600 horsepower 24-cylinder aluminium Railton Red Lion.

As usual, the outstanding feature of the year was the annual Memorial Day 500-mile Indianapolis classic won by Wilbur Shaw of Indianapolis. Shaw was a winner in 1937 and raced home first this year by maintaining an average speed of 115.035 mi. per hour over the 2½ mi. brick and asphalt oval course. He completed the 500 mi. in 4 hours 20 min. and 47.41 seconds. Jimmy Snyder of Chicago was second and Cliff Bergere of Hollywood, third.

The race was marred by the death of Floyd Roberts, 39-year-old pilot from Van Nuys, Calif., and the winner at Indianapolis in 1938. Roberts, who had planned to retire from the sport after the race, lost his life in the event's first fatal accident since 1935.

In the 100 mi. A.A.A. dirt-track championship event contested at the New York State Fair in Syracuse, Mauri Rose flashed home in front. Lemuel Ladd of Boston triumphed in the inaugural running of the Montauk Grand Prix road race over a two-mile course at Montauk, L.I., in July.

Midget automobile racing continued to flourish. A 150-mile national championship contest was held in August at the revamped Roosevelt Raceway in Westbury, L.I., and attracted 55,000 fans. Morris (Babe) Bower of Philadelphia was the victor, leading Joe Garson of Great Neck by 11 seconds.

Accidents in midget events claimed the lives of several drivers, Snyder being the most prominent among them. He was killed less than a month after his fine second-place performance in the Indianapolis big-car classic. The fatal accident occurred at the Cohokis (Ill.) track on June 29. (T. J. D.)

Automotive Safety Foundation: see TRAFFIC ACCIDENTS.

THE WORLD'S LAND SPEED RECORD fell again in 1939 as John Cobb sped over the course of Bonneville Salt Flats, Utah, August 23 at 368.85 m.p.h.

Aviation, Civil. Transport.—Airlines of the United States, Canada, and certain other countries continued their growth through 1939 but the outbreak of war in Europe caused drastic changes in many of the services operated over that continent. Plans for crossing the North Atlantic to the United States and Canada were also affected. Pan American began its regular transatlantic service in May of 1939 and has continued this operation, but Imperial Airways operated a service over this route for only a short time before the war caused its suspension. Deutsche Lufthansa, which had also planned a North Atlantic service and made extensive survey flights in 1936-1938, was forced to suspend its South Atlantic and many of its other foreign services as soon as the war began. Pan American still has the greatest route mileage of any organization (62,889 mi. in Oct. 1939) and, as the new European war began, Lufthansa was operating in Germany what was the most complete internal network of airlines existing under one head in any country. The Russian lines claim the greatest volume of freight while the United States domestic routes handle the largest number of passengers and, so far, the greatest volume of mail. The plan of sending all first class mail by air without extra charge began in Europe several years ago and was growing with surprising rapidity until the war interrupted. By far the most ambitious of the plans along these lines was the British "Empire Air Mail Scheme," which provided for linking of the entire empire with air routes carrying first class mail at ordinary rates. Formulated several years ago by the British Government in co-operation with the colonial governments, the first stage of this plan went into operation in June 1937 with service between England and South Africa. Services between England, India, and Malaya followed in Feb. 1938; extension to Australia and New Zealand came later in the year. Transatlantic service to Canada via the United States followed in 1939 but, as noted above, was later suspended by Imperial Airways on account of the war. About the same time the whole plan of carrying "all first class mail by air without surcharge" was shelved for the present. A change of economic importance took place in 1938-1939, when the growth of traffic put most airlines of the United States on a profitable basis for the first time.

Flying equipment of most airlines has shown a pronounced

tendency toward increased size in the past few years. Before the war began, Lufthansa was flying a number of 40-42 passenger Junkers airliners on its routes; the German firm of Blohm & Voss was reported to be constructing a 100,000-lb. long-range flying boat and the Russian Government had completed a 64-passenger landplane of about the same weight. Short Brothers had built 74,000-lb. flying boats for Imperial Airways' ocean routes and Air France Transatlantique had on order two 132,000-lb. flying boats. In the United States in 1938 Douglas produced the first of the DC-4 series, a 42-passenger land type and Boeing completed the first No. 314, a 74-passenger flying boat for ocean use. Several countries have been giving consideration to the so-called "sub-stratosphere" or high-altitude flying and craft designed for such use have been put into production in the United States. Advantages claimed for high-altitude operation are mainly those of encountering better flying weather, and of attaining higher speeds if supercharged engines are used.

General Commercial Development.—Although dwarfed by the rapid growth of air transport, other civil aviation continued to grow steadily. Aeroplanes in the hands of individual owners are not yet as common as some enthusiasts had expected, but they are now increasing, more particularly in the United States. In 1938, control of civil aviation in the United States was transferred from the Department of Commerce to the Civil Aeronautics Authority, a new body created for this purpose. Among its plans to foster civil aviation, this body put an ambitious pilot training plan into effect in 1939. This plan provides for payment by the Government of all flight training cost while the student pays most of the cost of the ground schooling. Under the impetus of this plan, flight instruction increased rapidly and by Nov. 1939 there were 29,513 licensed pilots in the United States. About the same time, the new European war brought large-scale construction of aircraft in the warring countries and caused renewed interest in military aviation in the United States. All of these factors combined to produce a very distinct "boom" in aircraft construction in the United States as well as in the countries at war.

Technical Development.—Rapid progress continued through 1939 in most branches of aeronautics. The renewed interest in rotating wing aircraft (which began several years ago) continued, and the U.S. Post Office awarded a contract for experimental use of autogiros to carry mail between the roof of Philadelphia Post Office and Camden airport. Service under this contract began in the summer of 1939 and has been operated successfully to date.

Aeroplanes still increase in size, and among the large transport types recently built are the Douglas, Boeing, Junkers, and Short Brothers craft already mentioned. When the war began in 1939, Latecoere was developing for transoceanic use a tremendous flying boat, which was reported to weigh 145,000 lb., and several firms have investigated the possibilities of still larger types. In 1938, Pan American obtained from Douglas, Consolidated, Martin, and Sikorsky, bids on long-range flying boats to carry 100 passengers but, to Jan. 1940, had not yet placed any orders for these. Consolidated carried its studies even farther, by investigating possible size limits, and its engineers reported as possible a 12,000 h.p. aeroplane to carry 300 passengers, a crew of 30, and to weigh about 400,000 pounds. Others made studies of possible speed limits, which seem to indicate that present racing speeds are close to the theoretically possible limits without some revolutionary advances in aerodynamics. The U.S. National Advisory Committee for Aeronautics, in particular, is working upon the problem of developing a wing form that would increase present theoretically possible speeds. Military craft are already being built for which speeds of as much as 435 m.p.h. are claimed, but censorship prevents more detailed and authentic information from being available. In transport, however, such performance is

barred by prohibitive cost of operation, and higher speeds are more likely to be attained by the use of higher altitudes of operation. Constructors are now building such transports for operation at 15,000 to 20,000 feet. These have cabins braced for internal pressure so that the air within can be maintained at the pressure normally encountered at lower heights. Boeing and Curtiss-Wright have already produced their first of this type, and the former was started into production in 1939.

Much was accomplished in the way of making air travel more comfortable for the passenger during the past few years. Almost all airliners now have sound-insulated walls, controllable ventilation, satisfactory heating, and adjustable seats in the case of long flights. Numerous airliners in the United States now have sleeping berths, but this plan has not been followed elsewhere, on account of the lesser distances involved. In a few cases, oxygen supply has been provided for passengers and crew when crossing high mountain ranges, but this still remains exceptional.

Engine Development.—Progress in engines was mainly along the lines of greater reliability and larger unit size, but progress was also made in fuels with higher anti-knock properties which permit the use of higher compression ratios and some consequent increase in engine efficiency. Diesels have been disappointing to date and, with the improved fuel efficiency obtainable with higher compression in gasoline engines, the advantage of the diesel has been distinctly lessened. Germany remained practically alone in continuing aviation diesel development and, even there, the recent trend has been away from this type. Lufthansa has had a considerable number of diesel-engined transports in service and found that maintenance costs ran high; original cost as well as weight exceeded that of the gasoline engine, and local overheating troubles were encountered. Just before the war disrupted technical news sources, it was claimed that these problems had been practically solved. Fuel economies of the diesel have not been sufficient to offset other objections and lack of diesels in large sizes has been another factor contributing to their decline in favour. Aircooled gasoline engines have now reached 2,000 h.p. in size and have thus far surpassed what was believed to be the practical limit a few years ago. In the past few years, a two-speed supercharger was produced by the Wright Corporation, the primary intent being to provide moderate supercharging for take-off and full supercharging for high altitudes.

Components and Accessories.—Aluminium alloy, steel-and-aluminium alloy, and all-steel, have almost completely superseded wood-and-metal in aeroplane construction, excepting for small craft and some special cases of larger ones. Retractable landing gears have become practically standard in transport types and

TRAVEL BY AIR in the United States: passenger-miles flown on scheduled airlines (revenue and non-revenue)

some recent designs provide a third wheel in the front to prevent nosing over when too much pressure is applied to the brakes. "Feathering" propellers have been developed by Ratier in France, and by Hamilton and Curtiss in the United States; the Hamilton propellers have been installed on some United Air Lines transports, being thus the first to find their way into commercial service. These propellers have several advantages. By adjustment of the blade angle to suit the operating condition, climbing rate is improved and economy is bettered at nearly all speeds. In multiple-engined craft flying with one engine "dead," performance is improved, as the blades of the "dead" propeller can be set to the "no thrust" position and its resistance decreased. Some of the latest propellers can be turned to "reverse" position, permitting use of the engine power to make a short stop after landing.

A new type of homing compass was produced by Sperry in 1938. This has an index finger which points directly toward any radio station upon which the apparatus is tuned, thus leaving the pilot free to use his earphones for other messages. The device does not require radiobeacons as it can be arranged for tuning in on a broadcasting station. Probably the most important instrument development of recent years is the "terrain clearance indicator," operating on the radio reflection principle, and which has been under development for several years. Its perfection was announced during 1938 by the Bell Telephone Laboratories and United Air Lines. The apparatus emits a radio wave and measures the time required for its reflection, the dial being calibrated to indicate directly the number of feet distant from the object.

NINETEEN-FOOT PRESSURE TUNNEL of the National Advisory Committee for Aeronautics at Langley Field, Va., shown for the first time May 2, 1939, to a visiting group of scientists

Traffic Statistics of the Two Leading International Air Transport Systems

Year	Passenger miles flown in year by	
	Pan American Airways*	Imperial Airways
1933	27,500,000	20,228,000
1934	41,009,280	22,411,000
1935	53,265,844	30,825,000
1936	66,661,462	27,021,000
1937	85,776,389	35,396,000
1938	87,636,601	40,000,000†
1939	105,400,000‡	See note

* All Pan American figures recalculated since last year.

† Estimated on basis of first nine months.

‡ Preliminary calculation.

Note:—Imperial Airways flew 8,743,856 passenger-miles in first three months of 1939. Drastic changes resulting from war effects preclude estimate of total for entire year.

causing the reflection. Demonstrations made in the latter part of 1938 showed the sensitivity and accuracy of the device to be almost uncanny. Every change in terrain below is faithfully shown, even to the extent of indicating clearance over structures passed in the flight.

De-icing equipment, which was developed in the United States a few years ago, and which has been regulation equipment on airliners there for some time, is now receiving world-wide acceptance. For a time, experiments with ice-preventive pastes were conducted in England and on some continental European airlines, but these have not proved as efficient as the mechanical de-icers. Icing of wings is serious, because it destroys lift by adding dead weight and affecting the aerodynamic efficiency of the wing, as well as interfering with the free operation of control surfaces. Many expedients have been tried but none has been so successful as the method of applying inflatable rubber coverings to the leading edge of wings. Normally, these bags lie flat upon the wing surface and, being treated with an oil, they retard the collection of ice particles in the first place. If the formation is persistent, the pilot brings into operation an apparatus which automatically inflates and deflates the bags at intervals, thus breaking loose any ice particles as rapidly as formed. For use on propellers, other apparatus has been devised to throw a liquid out on the blades to prevent ice from adhering.

Records.—The year 1939 witnessed several new records. The speed record for aeroplanes was moved to a new high in April, when Fritz Wendel flew for a short distance at the rate of 469 m.p.h. in Germany. Wes Carroll and Clyde Schlieper moved the maximum time in flight up to 726 hours, picking up fuel in cans,

during their flight near Long Beach, Calif., in Oct. 1939. The highest altitude ever attained by man is still the one established in 1935 when Cpts. Orvil Anderson and Albert Stevens of the U.S. Army ascended to 72,395ft. in a special stratosphere balloon. Gliders, or motorless aeroplanes, have continued to provide surprises in recent years. A non-stop glide of 50hr. and 26min. was made by A. Bodecker and K. H. Zander in a two-seater glider in Germany in 1938 and O. Klepikova, a Russian woman, established a record of 465mi. in one flight in 1939.

Backhouse, Sir Roger Roland Charles (1878–1939), British sea lord, was born November 24, the fourth son (a twin) of Sir Jonathan E. Backhouse. He joined the British Navy at the age of 12 and while still a youth became an expert in gunnery. He served throughout the World War and at the end of hostilities commanded a battle cruiser. From 1920 to 1922 he was director of naval ordnance. He was promoted to rear admiral in 1925,

vice-admiral in 1929, and admiral in 1934; in Feb. 1938 he was named first sea lord and chief of naval staff.

Illness forced him to retire May 17, 1939 and he died shortly thereafter, on July 15.

Bacon. Of the two foods for which Great Britain will depend on North America during the war one is bacon; the other wheat. Both will be drawn largely, if not entirely, from Canada. Soon after the outbreak of war the British Food Ministry asked the Canadian Government to provide for definitive deliveries of bacon weekly, and production of bacon was at once increased greatly in the Dominion. September 1 prices of Canadian Wiltshire sides were 87s. per cwt. in England, but this price was later advanced to 95s. to cover a rise of 33% in cargo rates, 2½% in insurance and the depreciation of the pound sterling in terms of Canadian currency.

Whether the United States may be drawn on to ship bacon to the United Kingdom depends on the ability of the Scandinavian countries and Holland to maintain shipments. *The Grocer*, London, printed an unconfirmed report early in the war that Germany had agreed with Denmark not to interfere with shipments to the United Kingdom if, in return, certain supplies were provided the Reich. These are contingencies which affect possible rationing of bacon and hams in Britain, where food control was established immediately on the declaration of war and all bacon stocks requisitioned by the Government. In the World War (1914–18) governmental food control was not established until the middle of the third year of the war. Under the Ottawa agreement of seven years ago Canada was allowed an export quota to Britain equivalent to 50,000 hogs a year, but the nearest approach to that quota was 35,000 in 1937, with shipments steadily declining through 1938 and until the beginning of war in 1939.

The highest monthly production of sliced bacon in the United States was recorded Aug. 1939, when 27,289,035lb. were produced. The second highest monthly production was 24,928,665lb. in Sept. 1939, according to the United States meat inspection service. Production in the United States of sliced bacon for the 11 months ending September 30 was 241,011,969lb. in 1939 and 215,065,296lb. in 1938. Passing of the amendment to the United States Neutrality act interfered with shipments of meat to the United Kingdom since other than American ships had to be found to carry the shipments. (See also Hogs.) (S. O. R.)

Bacteriology. Recently Dubos has discovered a bacterium in the soil which is capable of killing certain types of disease germs. The micro-organism which he has described is a Gram-positive staining, spore-bearing, aerobic bacillus which is capable of disintegrating the living cells of many Gram-positive microbial species. Several of the Gram-positive species may be seen to disintegrate when incubated with the killing agent. White mice are protected with this agent against infection with large numbers of virulent pneumococci. The bactericidal agent can be obtained in an active form free of protein.

Mutation among strains of the virus of tobacco-mosaic disease has been brought about by plating out on the leaves of *Nicotiana glutinosa*. This method of isolating strains has brought further evidence of the high degree of variability of tobacco-mosaic virus.

Cultivable filterable micro-organisms have been isolated which have many of the properties of bacteria and in addition some properties of viruses. These organisms have been isolated from samples of London sewage by fractional ultrafiltration and selected colony sub-culture. The particles, when separated and inoculated into a suitable medium, can initiate the development of a typical culture.

Infantile paralysis (poliomyelitis) virus has been found to be

more readily isolated from the stools of human patients than from the nasopharynx. A carrier state appears to exist in the common mild abortive cases. In convalescence these patients may excrete the virus in the stools for three weeks after their brief illness, which practically puts them in the class of "healthy carriers."

Several strains of a virus present in the lungs of apparently normal three to four weeks old Swiss mice have been isolated. It causes a fatal pneumonia in mice when inoculated intranasally under light ether anaesthesia, but does not produce an apparent infection when injected by other routes. Some normal human sera possess the capacity to neutralize the virus. This work is of great importance in that one must be very sure, when studying other viruses in the mouse, that natural occurring mouse virus strains are eliminated.

Bacteria-like bodies found in the alimentary canal of insects and arachnids are called Rickettsiae. Certain of these Rickettsiae are responsible for cosmopolitan diseases such as typhus fever. A filter passing agent was recovered by Davis and Cox in Montana, U.S., from the Rocky Mountain wood tick, *Dermacentor andersoni*. It was found that this agent survives in and is transmitted by nymphal and adult *D. andersoni* which have ingested the virus in the larval stage; it survives through the eggs deposited by infected females and is transmitted by the progeny.

A description of this Rickettsia-like infectious agent is given by Cox. This agent was found capable of causing an infection in a laboratory worker which resembled "Q" fever of Australia. The Australian disease is an acute illness with a febrile period of from 7 to 24 days and occurs chiefly among workers in abattoirs and among dairy farmers. More recent evidence indicates that the Montana, U.S., disease and Australian "Q" fever are closely related infections.

Badminton. Badminton not only attracted more general interest during 1939 but it also brought together more spectators for exhibition games, as well as 200 ranking players from all parts of the United States for the third annual national badminton championships, held in New York for the first time. Bill Markham, a young American professional of New York, took the measure of Jack Purcell, of Canada, the long-standing star of the English-speaking badminton world.

Following in the footsteps of many stellar California netmen, young Dave Freeman, of Pasadena (the 1938 national junior tennis champion in both singles and doubles) survived a three-day barrage of shuttlecocks to win the final round of the men's singles national championship. In doing so he dethroned Walter Kramer, of Detroit, who has held the championship since its inception in 1937. Hamilton Law and Richard Yeager were the best among the doubles contenders for the national doubles title. Among women badminton experts, Miss Mary Whittemore, of Boston, succeeded Mrs. Del Barkhuff as the national titleholder.

Europe.—The All-England championship, unofficially representing world ranking, sponsored its 36th annual competition in 1939, with the Danish entrants top winners—Tage Madsen in the

men's singles, and Mrs. Dalsgard and Miss Olsen in the women's doubles. The men's doubles title went to T. H. Boyle and J. L. Rankin of Ireland. In the ladies' singles, Mrs. W. R. Walton, of Toronto, won the title. That Canada is making rapid strides in the game was shown in the Canadian Open (amateur and professional) when George Goodwin (pro) of Ottawa won the singles title, and Paul and Jim Snyder (amateurs) of Waterloo, Ont., won the doubles crown. (J. B. P.)

Bahamas, a British colony and island group east and south-east of Florida; language, English; capital, Nassau (pop. 19,756); governor, Sir C. C. F. Dundas; area 4,375 square miles. The population (1931 census: 59,828) was officially estimated at 67,720 in 1939. The Government is administered by an appointed governor and legislative council and an elected assembly.

Outbreak of the European war in Sept. 1939 was met in the Bahamas by legislative action putting the colony on a war footing, imposing a censorship, and appointing a food control committee to regulate prices and food distributing. The colony has cable and radio communication with the outside. In 1939 a modern dial-telephone system (costing nearly £70,000) was completed at Nassau. Tri-weekly air communication (daily in winter) is maintained with Miami. Normally, five steamship lines call regularly, but owing to disruption by war conditions, the Government was compelled, in Nov. 1939, to subsidize a United States line to maintain service through the winter. In a further effort to encourage tourist trade, passport regulations were waived. The tourist trade, valued at £1,000,000 annually, is the most important factor in the colony's economy, and, with increasing real estate investments, offsets the unbalance of trade. In 1938 imports were £1,138,839 and exports (including £64,688 re-exports), £213,135. Imports were derived: from the British Empire, 42.32% (Great Britain, 23.8%; Canada, 11.48%); United States, 44.76%. The British Empire took 57.74% of exports (Great Britain, 28.29%; Canada, 24.38%), the United States, 23.12%, the Netherlands, 9.37%. Imports are flour, meats, and other foodstuffs, and miscellaneous manufactured goods. In 1938 sponges comprised 60% of domestic exports, tomatoes (exclusively to Canada), 17%; lumber, 6%; crawfish, 4.5%. Hemp production was less than 1% in 1938 (4% in 1937). These products, along with fish for local consumption, constitute the chief products. The monetary unit is the pound sterling. Education is compulsory. In 1938 there were 119 elementary schools (including 57 Government-aided private schools), with an enrolment of 12,896. Education is allotted approximately 5% of the colony's budget (£30,037 in 1938). (L. W. BE.)

Baker, Thomas Stockham (1871-1939), U. S. educator, was born on March 23 at Aberdeen, Md., and was educated at Johns Hopkins university and the University of Leipzig. He was associate professor of German at Johns Hopkins from 1895 to 1900 and lecturer on German literature there from 1900 to 1908. During this time also he was music critic of *The Baltimore Sun*. From 1909 to 1919 he was director of the Jacob Tome institute at Point Deposit, Maryland. In 1919 he became secretary of the Carnegie Institute of Technology at Pittsburgh, and was president from 1922 to 1935. An authority on scientific methods of coal production and research, he was interested also in international affairs and lectured widely in the U.S. and Europe. He died at Pittsburgh April 7.

Balance of Trade: see EXPORTS AND IMPORTS; INTERNATIONAL TRADE.

Balkan Entente. The Balkan Entente is an instrument of co-operation of Greece, Rumania, Turkey, and Yugoslavia for the maintenance of peace in the Balkan peninsula. It was primarily aimed against the revisionist claims of Bulgaria which demanded the return of territory lost to Rumania, Greece, and Yugoslavia. With the rapid deterioration of the international situation since 1938, efforts were made to turn the Balkan Entente into a closer alliance of the four Balkan countries, so as to oppose a united front to any expansion of Germany or Italy into the Balkan peninsula. To this end the co-operation of Bulgaria was sought. The Italian occupation of Albania in the spring of 1939 increased the fears of the Balkan countries lest Italy might use the newly acquired foothold in the peninsula for exercising strong pressure upon Greece and Yugoslavia. The conclusion of a firm alliance was, however, hindered by the mutual jealousies among the Balkan countries themselves, by their unwillingness to meet at least some of Bulgaria's demands, and by their inability to face courageously by common action a possible future danger to the security and existence of all of them. To become effective, the Balkan Entente would have to be transformed into a bloc of countries committed to promises of mutual and automatic assistance. Whereas Rumania, feeling herself most threatened by German pressure and by territorial demands on the part of the Soviet Union, of Hungary, and of Bulgaria, favoured such a development, Yugoslavia, although bound to Rumania by a defensive pact in case of attack on the part of Hungary or Bulgaria, was opposed to any tightening of her obligations.

The latter part of 1939 saw an easing of the tension between Italy and Greece by the exchange of formal letters between the two Governments on November 2, confirming friendly relations and their desire to contribute to the preservation of peace in the southern Balkans. On the other hand, the active entrance of the Soviet Union into European politics on the side of Germany increased the tension in Rumania and in Turkey, both of which feared possible Soviet demands on their territories. Bulgaria, where many of the younger elements have Communist and many of the older politicians Pan-Slav sympathies, both centring on Soviet Russia, felt herself encouraged by Russian designs upon the Balkans. Hungary, which pressed her demands for Transylvania upon Rumania with increased insistence, was restrained, however, by her fear of any Soviet advance along the Carpathian mountains and sought Italy's assistance, both in her claims against Rumania and in her protective measures against the Soviet Union. Italy and Hungary tried to win Yugoslavia to their side and to disintegrate, by an Italo-Hungarian-Yugoslav alliance, the Balkan Entente. Count Ciano, the Italian foreign minister, expressed in his speech of December 16 Italy's opposition to the formation of a Balkan bloc. Great Britain, France, and Turkey favoured the formation of a Balkan bloc with a stabilizing influence on the peace in southeastern Europe, but at the end of 1939 the Balkan Entente seemed no nearer to this goal than in 1938 and was in danger of undergoing the same fate as her counterpart, the Little Entente. (H. Ko.)

Ballroom Dancing: see DANCE.

Baltimore, metropolis of Maryland. Area 91.93 square miles. Population (1939) 868,990 of which 173,482 were Negroes. Total population 1938, 862,059. The city ranks eighth in population among cities of the U.S. Birth rate per thousand 1939 (11 months) 14.6, 1938 (12 months) 15.3. Death rate 1939 (11 months) 12.1, 1938 (12 months) 12.3.

History.—Mayor Howard W. Jackson and comptroller R. Walter Graham were re-elected to office; Richard C. O'Connell was

elected president of the City Council. All terms expire May 1943. A loan of \$2,000,000 for schools and one of \$1,000,000 for completing the municipal airport were approved by the electorate but proposed loans for the extension of sewers and paving failed of indorsement. A system of permanent registration of city voters was inaugurated.

Education.—Enrolment in public elementary and high schools (1939) was 112,050 of which 22,190 were Negroes; for 1938 the figures were 116,234 and 30,370 respectively. Roman Catholic elementary and high schools had 35,248 pupils, an increase of 2,204.

The number of students in private schools was 3,258.

Finances.—Bonded indebtedness (Nov. 1939) \$184,263,579, (Nov. 1938) \$182,081,579. Appropriation for 1940 from the tax levy is \$51,018,936, an increase of \$2,208,579. Approved expenditures for special purposes from existing and tentative loans raised the total amount for 1940 to \$61,759,097. Taxable basis 1940 \$2,225,091,796, a decrease of \$408,561. Tax rate 1940 \$2.80 per \$100, an increase of 15 cents; \$1.10 represents debt service; 79% of the city's debt has been created since May 1919 during the terms of two mayors.

Funds available for public works \$5,500,000.

Trade and Manufactures.—Foreign trade for the first nine months of 1939 amounted to—exports \$62,857,959, (same period 1938, \$63,051,924); imports \$46,245,131, (1938, \$50,123,501). The value of manufactured products in the Baltimore industrial area in 1937 in 1,835 plants was \$925,760,636. (Ed. El.)

Bananas. Disruption of ocean traffic consequent to the declaration of war did not in 1939 interfere with banana shipments as severely as in the World War or to the extent banana growers had anticipated. The Swedish fruit market was without bananas for two weeks, but the authorities then arranged for two Norwegian steamers to bring in shipments every 14 days to Gothenburg. In Jamaica banana growers early in the war suspended spraying for leaf spot, under the misapprehension that war would so greatly curtail the market the expense of spraying was useless. Spraying, however, was resumed as shipping continued to be fairly regular. More disastrous than war, to Jamaica banana plantations, was the violent wind and rain storm of Nov. 3, 1939, the worst since 1903. Official reports said 75% of the trees were damaged. Unofficial estimates, through consular reports, said 2,000,000 stems were destroyed and between 18,000,000 and 20,000,000 plants blown down. Banana shipments from Jamaica from Jan. 1 to Oct. 21, 1939, were 17,254,091 stems, compared to 20,361,708 stems for the full calendar year of 1938. Shipments from Guatemala the first nine months of 1939 were 7,702,741 stems, compared to 7,598,756 in the same period in 1938. Costa Rican shipments were 2,345,714 stems the first eight months of 1939 and, correspondingly, 1,879,324 in 1938. Haiti shipped 2,029,767 stems the year ending Sept. 30, 1939, and 1,363,176 the preceding year. Panama shipments the first six months of 1939 were 2,949,738 stems. Heavy damage from storms in August curtailed subsequent shipments. The 1939 crop of the Dominican Republic was placed at 1,000,000 stems in consular reports. (S. O. R.)

Bankers Association, American: see AMERICAN BANKERS ASSOCIATION.

Bank for International Settlements. The growing tension in Europe culminating in the outbreak of war in the autumn of 1939 naturally affected the bank's activities and provided the main explanation for the reduction in the total of the balance sheet

from 606,500,000 Swiss gold francs at the end of the fiscal year on March 31, 1939, to 459,600,000 Swiss gold francs at the end of Nov. 1939. As central banks for security reasons proceeded to convert exchange balances into gold or had to employ these balances for payments abroad, the amounts which could be entrusted to the Bank for International Settlements on deposit account necessarily shrank. The volume of transactions handled by the bank—mostly purchases and sales of gold for central banks—has, however, not diminished in the same degree as the balance sheet total. The bank's services have continued to be utilized especially by central banks in smaller countries, who from time to time must procure currencies to meet foreign payments or wish to convert currency balances into gold or request the bank to transfer gold for their account from one centre to another. Under Art. 37 of its statutes the Bank for International Settlements can only carry out transactions to which the central bank in the market concerned does not object, which ensures that the Bank for International Settlements must act in conformity with the central bank policy pursued in the different countries.

The outbreak of war naturally brought to an end business between belligerent countries as well as other operations prohibited by Trading with the Enemy Acts and similar war restrictions. Although the meetings of the board of the bank were suspended in the autumn of 1939, the president, as the chief executive at the seat of office in Basle, kept in touch with the various members of the board individually as to the main lines for the conduct of the bank while the war lasts. In the early spring of 1939 Dr. J. W. Beyen intimated to the board his intention to resign as president and in June Mr. McKittrick, a United States citizen with long experience of banking in various European countries, was appointed his successor, beginning his term of office on Jan. 1, 1940. The result of business operations for the financial year ending March 31, 1939 showed a profit of 8,544,000 Swiss gold francs compared with 9,012,000 Swiss gold francs in the preceding financial year. A 6% dividend in gold has again been distributed and the usual allocation has been made to reserves, which on March 31, 1939 were 24,300,000 Swiss gold francs compared with a paid up capital of 125,000,000 Swiss gold francs. (P. JN.)

Banking. Continued growth in deposits occurred during 1939 in the banking system of the United States, chiefly due to further large imports of gold to the U.S. from war-torn Europe, and to continued financing of the Government which again operated at a substantial deficit. The number of banks in operation varied slightly from the previous year, standing at 15,082 on June 30, 1939, the latest date for which complete figures are available, as against 15,287 on June 30, 1938. Deposits, however, stood at \$55,992,000,000 an increase of \$3,797,000,000 over the figure of \$52,195,000,000 shown a year earlier.

The most important of the total number of banks are those which are members of the Federal Reserve System, whether National or State banks or trust companies. These numbered 6,330 with deposits of \$38,027,000,000 and constitute the backbone of the commercial banking system. The growth in deposits referred to above occurred primarily in this system, which accounted for a gain of \$3,281,000,000. Reserves of member banks with the Federal Reserve banks reached an all-time high during the year, excess reserves on Oct. 18, 1939 standing at \$5,509,000,000. At the same time gold stock in this country had accumulated to the record-breaking figure of \$17,000,000,000. (For activities of the Board of Governors of the Federal Reserve System and the Treasury in the field of money and credit control, see FEDERAL RESERVE SYSTEM.)

The rate of business activity as reflected in the turnover of bank deposits did not keep pace with the increase in deposits.

THE REICHSBANK after Hitler's assumption of complete financial authority June 16, 1939, as seen by Russell of *The Los Angeles Times*

Loans and investments increased during the first half of 1939 but the rates of interest earned on them decreased. This trend was reversed temporarily during the second half, with the growth in volume of commercial loans in August and the outbreak of the European war in September. Considerable selling of Government obligations occurred in September, resulting in lower prices and higher yields, but such holdings were replaced later in the year when total holdings of Governments by member banks again stood at or near record levels. While most of these holdings were of short maturities, there was a tendency to lengthen the average maturity as reinvestments were made. The relative proportion of shorter term obligations was greater in New York city banks than in reserve city banks and greater in reserve city banks than in country banks. Taking direct and fully guaranteed obligations together, the proportion of those with maturities of 5 years or less to the total was 56% at New York city banks, 36% at reserve city banks, including Chicago, and 32% at country banks.

Earnings of member banks of the Federal Reserve System showed an increase for the year ended on June 30, 1939, due to the sharp lift in earnings for the last half of the period. An analysis of these earnings shows that current operating earnings and expenses were relatively stable and that the increase resulted primarily from larger profits on sales of securities and smaller charge-offs on loans. Recoveries, profits on securities sold, and similar items exceeded total losses and depreciation for the first time since 1936. Trust department earnings, commissions, and service charges on deposit accounts continued to be considerable factors, amounting to about 14% of total current earnings.

Future expenses will be somewhat increased by an amendment to the Social Security Act which provides that all member banks will be subject to the Act after Jan. 1, 1940.

Following the outbreak of the European war in September, President Roosevelt proclaimed, under the Neutrality Act of 1937, that a state of war existed between France, Germany, Poland, the United Kingdom and associated Commonwealths, thus prohibiting the extension of certain credits to these nations. However, the

President authorized the exemption of ordinary commercial credits of a character customarily employed in peace time commerce. The Federal Reserve Board authorized advances to non-member banks on Government obligations at par at the rates prevailing for member banks. The banks did not experience any drain of funds and no demand developed for such advances.

Legislation affecting banking included the extension of the period during which direct obligations of the United States may be used as collateral security for Federal Reserve notes to June 30, 1941. Congress also repealed the requirement that all State banks having average deposits of \$1,000,000 or more in 1941, or thereafter, must become members of the Federal Reserve System in order to have their deposits insured by the Federal Deposit Insurance Corporation. This Governmental institution now insures 13,569 banks.

The Trust Indenture Act of 1939, approved August 3, contains far-reaching requirements, limitations, and restrictions relating to trust indentures under which certain securities are issued and sold in interstate and foreign commerce and through the mails. It is not yet known to what extent the banks and trust companies who customarily act as trustee of bond issues under such indentures will have to revise their practices, but considerable changes undoubtedly will be required to meet the increased duties placed on such trustees which will in turn require the imposition of increased fees. The Federal Reserve Board postponed to Feb. 1, 1940, the operation of the Clayton Act of 1935 prohibiting interlocking bank directorates. In a study presented in answer to frequent requests for congressional action to provide stabilization of prices through monetary control, the Federal Reserve Board concluded that prices cannot be controlled by changes in the supply of money. (See also BONDS; FEDERAL LAND BANKS.)

Great Britain.—The principal new development affecting the British banking system in 1939 was the outbreak of war in September, the shock of which was lessened by preparations induced by the failure of the Munich Pact. After some recession in mid-year, commercial bank deposits showed a gain for the 12 months ended October 31, from £2,256,000,000 to £2,327,000,000. Loans and securities showed an increase. (See BANK OF ENGLAND.)

Canada.—The forces of recovery at work in the previous year continued throughout 1939, aided by exceptional crops and improved industrial conditions only partly due to the outbreak of war in September. The Bank of Canada continued its cheap money policy, which was affected temporarily by the shock of war. The first operation of the Government in war finance was undertaken in November in the form of a loan of \$200,000,000 from the chartered banks on two-year Treasury Notes at 2%. The balances of the chartered banks with the Bank of Canada rose from \$211,000,000 to \$221,000,000 during the year ended Sept. 30, 1939, while the gold reserve increased from \$181,000,000 to \$225,000,000. Note circulation rose from \$175,000,000 to \$212,000,000. The ten chartered banks reported a successful year with improved earnings in some instances. Deposits increased from \$2,480,000,000 to \$2,524,000,000 during the year ended Aug. 31, 1939, with further increases indicated during autumn war activity. Earning assets were still preponderantly in investments, which increased during the year from \$1,409,000,000 to \$1,507,000,000 while commercial loans fell off from \$986,000,000 to \$957,000,000 in August, recovering later.

Europe.—International movements of funds continued to affect banking in 1939, particularly just before and after the outbreak of war in September. The Netherlands, which had experienced an influx of funds in 1938, was one of the countries to suffer a flight of capital in 1939, gold reserves decreasing in the year ending Oct. 31, 1939, from gl. 1,461,000,000 to gl. 1,120,000,000. With increased activity of business and the financing of war require-

ments, banks in European countries generally showed increases in deposits. The Bank of France increased its gold holdings due to repatriation of foreign funds of French citizens under the war act, further easing credit. (See BANK OF FRANCE.) The note circulation increased in most European countries.

The neutral countries feared the effect of blockades. Scandinavian countries ended the year threatened by Russia's war on Finland. The Central European countries were concerned with the British blockade of both exports and imports of Germany. Germany placed the Reichsbank under the unrestricted sovereignty of the Reich and passed numerous special measures to extend credits to industry to prosecute the war. The average yearly deficit of the Reich increased to a rate of about Rm. 15,000,000,000. Total debt increased from Rm. 20,000,000,000 to Rm. 30,000,000,000. Inflationary tendencies were evident in the use of "tax certificates" as currency, and increase in money in circulation from Rm. 6,686,000,000 in 1937 to Rm. 10,583,000,000 in Nov. 1939. (See also EXCHANGE RATES; FINANCIAL REVIEW; SAVINGS BANKS, MUTUAL.)

(E. B. L.)

Bank of England. Partly, but not wholly as a result of the war, 1939 witnessed several fundamental changes in the structure of the Bank of England. As the table shows, the year opened with the fiduciary issue at £230 millions, and with the Bank's gold valued at 84s.11d. an ounce fine, a statutory price which had been in force for over a century. During 1938, however, the British Exchange Equalization Account had sustained heavy gold losses, and so in the first week of 1939 it had to take over £200 millions of the Bank's gold. This reduced the Bank's gold from £326 to £126 millions. To prevent a corresponding contraction in the total note issue, the fiduciary issue was raised from £230 to £400 millions.

The next change came two months later. A new Currency and Bank Notes Act was passed, which *inter alia* abolished the old statutory valuation of 84s.11d. per fine ounce of gold. Instead the Bank and the Treasury were empowered to value the Bank's gold at a price approximating the London market gold price of the day. This change took place on March 1, when the Bank's gold was written up to 148s.5d. per ounce, and its total value from £126 to £226 millions. This last increase permitted the fiduciary issue to be fixed at £300 millions, but the old power of varying the fiduciary issue by administrative action was retained.

On September 3 war broke out, and it was necessary to concentrate all the British gold reserves in the hands of the Exchange Equalization Account. Legislation to this effect was quickly passed, and since then the Bank has only held a nominal amount of gold to obviate a reduction in the note issue. The fiduciary issue was raised from £300 to £580 millions.

*Only £100,000 to £200,000.

The war naturally brought several other changes. On August 24 the Bank rate was raised from 2% to 4%, this being the first change since 1932. The increase was a precautionary measure, designed to check war speculation and to force the City to put its affairs in order. The war also brought with it control over all foreign exchange transactions, and the Bank of England was made responsible for the administrative side of this work.

When the war emergency budget appeared at the end of September, this in itself was a sufficient deterrent against any desire to speculate, and so the Bank rate was reduced to 3%, on September 27. A further reduction to 2% was made on October 25. It had been expected that this second reduction would be delayed until the first war loan appeared, to provide a stimulus to the investor. The authorities, however, desired to restore a regime of cheap and plentiful money, both to promote confidence and to keep down the cost of Government borrowing.

The war has led to some expansion in the note circulation, especially in the early days. Fear of the dislocation of business due to air-raids induced both the commercial banks and the public to hold more currency than usual. Evacuation and the payment of the armed forces also increased the demand for currency. By November some of these influences had ceased and the circulation was back to £528 millions. The December growth was the normal seasonal movement. The fiduciary issue has been fixed enough to maintain an adequate reserve of notes in the banking department, while the banking department is also holding sufficient securities to keep bankers' deposits at a reasonably high level. The latter, however, are subject to wide fluctuations, owing to the lack of complete synchronization between the heavy Treasury Bill payments and maturities necessitated by war finance; still on the whole the Bank is maintaining an abundant supply of credit.

(N. E. C.)

Bank of France.

Up to the outbreak of war, the French financial position underwent a distinct improvement during 1939. Confidence had been restored by the financial reforms of the autumn of 1938, and there was a marked repatriation of French funds and gold. The Bank of France benefited accordingly. In April and again in August 5,000,000,000frs. of gold were transferred from the reinforced resources of the French Exchange Fund to the gold reserves of the Bank of France, making a total accretion of 10,000,000,000 francs. By August the Bank of France held 97,266,000,000frs. (£550,000,000 sterling) of gold.

The war brought with it new problems. On the outbreak of war general uncertainty and other causes were responsible for a growth in the note circulation, and also in additional borrowing by the public and financial circles from the bank. This last is shown by the growth in bills discounted and 30-day loans. As the war progressed, the French Government had to borrow from the bank, and a fresh class of provisional advances made its appearance, rising to 14,750,000,000frs. (£85,000,000 sterling) by the end of the year. War expenditure equally caused a further expansion in the note circulation to 152,969,000,000frs. (£870,000,000 sterling) by the end of the year.

The ratio of gold to sight liabilities remained at the adequate level of 58.0%.

Bankruptcy.

With business failures on the wane in 1939, legislative activity in this field likewise subsided, and the year saw but one new chapter added to the Bankruptcy Act (Chapter XV; Public No. 242, 76th Congress, 1st Session). Reflecting the continued plight of railroads, the chapter, which is to expire within a year, sanctions bond maturity extensions and interest reductions for roads deemed not in need of thoroughgoing

reorganization. As in other bankruptcy reorganization statutes, the machinery of composition is utilized to hind minorities to acquiescence, but while the chapter subjects plans to some scrutiny by the Interstate Commerce Commission and the approval of the Federal court, it is lacking in other reorganization safeguards found in Chapter X (the corporate reorganization section) and Section 77 (the railroad reorganization section) of the Act. The latter section, under which progress was made toward completion of long-pending proceedings, would itself be extensively revised in the so-called Wheeler-Truman "Railroad Reorganization" Bill (S. 1869, 76th Congress, 1st Session) with an eye to further expediting sound railroad plans; the bill was passed by the Senate in May 1939, and at the turn of the year awaited further Congressional action.

In the courts the more significant developments in bankruptcy concerned themselves also with reorganizations. Thus, in *Case v. Los Angeles Lumber Products Co., Ltd.*, decided Nov. 6, 1939, a new landmark in the law, Mr. Justice Douglas expressed the decision of the United States Supreme Court that "fair and equitable" reorganization plans under the bankruptcy statutes must adhere to the historic equity doctrines of the *Boyd* case, 228 U.S. 482, and must exclude valueless interests except upon the basis of a contribution in money or money's worth reasonably equivalent to the participation accorded them. In *Taylor v. Standard Gas & Electric Co.*, 306 U.S. 307, the Supreme Court, by Mr. Justice Roberts, held that a parent corporation's claim against a wholly owned subsidiary should be allowed to participate in the latter's plan of reorganization only in subordination to the publicly held preferred stock of the subsidiary, because of the history of spoliation, mismanagement, and faithless stewardship of the affairs of the subsidiary by the parent. Again, in *Pepper v. Litton*, decided Dec. 4, 1939, Mr. Justice Douglas implemented the powers of the bankruptcy courts as an instrument in the enforcement of fiduciary standards for corporate directors and dominant stockholders, in sustaining the broad jurisdiction of such courts to examine the validity of all claims, and to set aside claims violative of such standards.

In the administrative sphere, too, the aspect of reorganization predominated, for in the year the Securities and Exchange Commission became a participant in more than a hundred corporate reorganizations under Chapter X, a function inaugurated under the amendatory Bankruptcy Act of 1938 in order to provide the courts and investors with impartial and expert advisory assistance. While the Commission's concern was primarily with the fairness and feasibility of reorganization proposals, it was in addition a salutary force in securing the compliance of parties with the law's procedural requirements, and in affording a repository of information relating to the law's operations.

In the field of bankruptcy proper the only notable development of the year was the appointment by the Attorney General of a committee to investigate the administration of the Bankruptcy Act, with Solicitor General Jackson as chairman and a membership representative of the Federal bench, Government departments, and the law schools. This committee has undertaken the study of the operation and effect of the numerous procedural and substantive innovations made in the amendatory Bankruptcy Act of 1938, with particular regard to the compensation of referees and other officers, to the lack of co-ordinated governmental supervision of bankruptcy administration and commercial frauds generally, and to the burdens on the Federal judiciary entailed in the administration of insolvent estates. (See also RAILROADS.)

(J. N. F.)

Baptist Church. The Baptists of America, totalling 10,548,673 members, are divided into two main

bodies; the first, three groups with 10,008,673 members; the second, fifteen miscellaneous groups with 540,000 members. In the first division the Southern Convention has 24,932 churches with 4,770,185 members; the National (coloured) 24,000 churches and 3,796,645 members; the Northern 7,569 churches and 1,471,788 members.

The Southern (Baptist) Convention (May 1939) concerning International Relations resolved: "In view of the present confused and disturbed International Relations we pledge ourselves anew to the spirit of peace and to the cultivation of that spirit among our people and in our relation to all other peoples."

They also declared: "Believing religious liberty to be not only an inalienable human right, but indispensable to human welfare, a Baptist must exercise himself to the utmost in the maintenance of absolute religious liberty for his Jewish neighbour, his Catholic neighbour, his Protestant neighbour, and for everybody else."

The Northern (Baptist) Convention (June 1939) passed the following resolutions: "Whereas, war is utterly contradictory to the spirit and ideals of Christianity, carries with it destruction of spiritual and moral values . . . therefore, be it

"Resolved, that we declare our emphatic opposition to the whole war system and all things related thereunto, furthermore, be it

"Resolved, that we give our support to pacific means for settling international disputes and that as fundamental to this we work for the establishment of the Kingdom of God on earth based on righteousness and justice."

One of the most significant gatherings was the meeting of the Congress of the Baptist World Alliance in Atlanta, Georgia, in July, attended by some 60,000 Baptists. Concerning peace and war the Congress, among other resolutions, adopted the following:

"It seems to us to be an important task for all the friends of peace in the world to try to keep, strengthen, and guard the League of Nations, and to work for making the League a better instrument for the fellowship and co-operation between nations than it is at present. This should be done through needed reforms in a human and Christian spirit. For this purpose it is evidently of utmost importance that, if possible, all nations become members of the League."

Barley. Average prices received by United States farmers for barley advanced from 34.5 cents a bushel August 15 to 42.8 cents a bushel Sept. 15, 1939, as a result of the outbreak of war. The barley crop in 1939 in 22 leading countries was estimated by the International Institute of Agriculture as 1,135,332,000bu., and 1,049,911,000bu. in 1938. U.S.S.R. and China are omitted. Unofficial estimates placed the Russian crop at 340,769,000bu. in 1938. Latest Chinese figures are an average annual yield of 346,212,000bu., 1933-37.

The United States crop was 269,540,000bu. in 1939 and 252,139,000bu. in 1938, Department of Agriculture preliminary estimate. Canada, 99,209,000bu. in 1939 and 102,242,000bu. in 1938. Other production is given in the accompanying table. (S. O. R.)

Baroda, Maharaja, (GAEKWAR SIR SAYAJI RAO III) (1863-1939), Indian prince and gackwar of Baroda, was born on March 10 of parents who were members of the less affluent branch of the State's royal family. In 1874 his predecessor, Malhar Rao, was deposed after being tried for poisoning a British resident. The widow of Malhar Rao's predecessor was asked to choose an heir from among the descendants of the original gackwar, and her choice fell upon Sayaji Rao, then a lad of 12. He became maharaja in 1875 and was invested with full powers in 1881. An enlightened ruler, he instituted many reforms in his small state such as the forbidding of infant marriages, the readjustment of the old systems of taxation, and the building of hospitals and industrial schools. He favoured British rule in India and during the World War made gifts of approximately 3,300,000 rupees to Great Britain for war purposes. In 1881 Queen Victoria made him a Knight Grand Commander of the Star of India and in 1919 he was awarded the Grand Cross of the order of the Indian Empire. He died at Bombay on February 6.

Barton, Donald Clinton (1889-1939), American geologist, was born June 29 at Stow, Mass., and was educated at Harvard, where he received his doctorate in 1914. After two years of teaching he was employed as a field geologist for an oil company. He became one of the nation's leading geophysicists and authorities on the geology of petroleum. In 1939 he was elected president of the American Association of Petroleum Geologists. He died July 8 at Houston, Texas.

Barzilai, Salvatore (1860-1939), Italian patriot and legislator, was born at Trieste on July 5. As a young man he became associated with the Italian Irredentist movement, and in 1878 he was arrested for treason at Trieste for plotting the conquest of the Trentino while Austrian troops were engaged in the occupation of Bosnia and Hercegovina. After a year in prison he was acquitted and went to Italy, where he studied law and became editor of the *Rome Tribuna* (1883-1893). He was president of the Italian Press association from 1902 to 1915 and from 1920 to 1922. The formation of the Triple Alliance in 1882 did not discourage Barzilai's tenacity in opposing Austria and agitating for "return" of the Trentino. After Italy declared war against Austria and was awarded the "irredeemed" Austrian territory by the treaty of Versailles, Barzilai's popularity in Rome scarcely knew bounds. He served as minister without portfolio in the second cabinet of Premier Salandra, was a delegate to the Peace Conference in 1919, and senator from Dec. 4, 1920 until his death at Rome on May 1. He was the author of several volumes on criminology and penology.

Basalt: see STONE.

Baseball. The year in which baseball observed its centennial was notable chiefly for the unquestioned domination of the New York Yankees under the leadership of their manager, Joseph Vincent McCarthy. Colonel Jacob Ruppert, who built this baseball empire and, as owner and president, guided it many years, died early in the year. Lou Gehrig, last of the old guard, the "Murderers' Row" of another generation, withdrew from the picture involuntarily, stricken with a form of paralysis, on May 2 after rounding out a matchless record of 2,130 consecutive games in his major league career spanning 15 years.

They won their fourth straight American League pennant and their fourth straight world series. They smashed the Cincinnati Reds, winners of the National League pennant, in four straight games to achieve their world series triumph. They had the leading batter in Joe DiMaggio, the game's greatest player. They had

six of their pitchers among the leading ten in the American League's final official averages. They had the most effective defensive club in either league. In short, the Yankees had things all their own way, even down to the outcome of the annual All-Star game in mid-season when the American Leaguers, Yankees, naturally, predominant in the lineup, trounced the National Leaguers. Only in patronage was the National League in the ascendant. The older circuit attracted close to 6,000,000 to its championship games. The attendance for the eight American League cities approached 5,000,000. Night baseball, introduced to the major leagues by Cincinnati and Brooklyn in past years, spread to the American League where Cleveland, Chicago, and Philadelphia played under artificial light. The Yankees gave the movement impetus by agreeing to play night games away from home, although the club steadfastly scorned introducing night baseball in the huge Stadium in New York city. Radio broadcasts of games were conducted in both the Yankees' and the Giants' home parks for the first time.

The Yankees created a record when they became the only club in major league history to win four straight world series championships. They won the first game, 2-1, as a crowd of 58,541 occupied the Yankee Stadium. Charley (Red) Ruffing, pitching hero of the opening game of the 1938 series, conquered Paul Derringer of the Cincinnati Reds in a struggle of right-handed pitching aces. A three-base hit for the Yankees' rookie star, Charles Keller, when Ival Goodman, Cincinnati right-fielder, misjudged his fly, was followed by William Dickey's single to clinch the game for the Yankees with one out in the ninth inning. In the second game Monte Pearson's 2-hit pitching and Ellsworth (Babe) Dahlgren's first world series home run were highlights in a Yankee victory, 4-0, at the expense of Bucky Walters.

A crowd of 59,791, largest for the series, saw the game in the Yankee Stadium. Two home runs by Keller, others by DiMaggio and Dickey, gave the Yankees victory, 7-3, in the third game, played in Cincinnati before 32,723 persons. The fourth and final game, played in Cincinnati, saw the Reds go completely to pieces, three errors committed in the tenth inning letting in three runs which gave the Yankees the game and the series, 7-4, before 32,794 fans.

Because of the modest accommodations in Cincinnati's Crosley Field, crowds and receipts were not as large as in some other years. The players' pool likewise fell off. A total of 183,849 persons saw the four series games. The aggregate receipts amounted to \$745,329.09. The players' pool amounted to \$380,117.84, which compares to \$434,094.66 for the four-game series in which the Yankees beat the Chicago Cubs in 1938.

In the championship season the Yankees became the only club in American League history ever to win eleven pennants. They gave to Manager McCarthy the distinction of his fifth pennant as club pilot. They were hailed generally as baseball's all-time super-team. They clinched the pennant early in September and finished the season 17 games ahead of the Boston Red Sox, after an uncertain early-season start. In third place were the Cleveland Indians. Then came Chicago, Detroit, Washington, Philadelphia, and St. Louis. In contrast, was the exciting finish for the pennant in the National League. The Cincinnati victory was not assured until the season entered its final week. Then the athletes under William McKechnie, known to intimates as "The Deacon," gave Cincinnati its first baseball pennant in 20 years, or since the dark days of 1919 leading to what developed into the notorious Black Sox world series scandal that shook baseball to its foundations. Cincinnati repulsed the threat of St. Louis and finished the season $4\frac{1}{2}$ games ahead of St. Louis. The other clubs in the National League finished in this order: Brooklyn, Chicago, New York, Pittsburgh, Boston, Philadelphia. The Philadelphia clubs in each

BILL WERBER OF THE CINCINNATI REDS lines out the second and last hit off Monte Pearson, New York Yankee pitcher, in the ninth inning of the second World Series game Oct. 5, 1939. The Yankees won the series in four straight games

league finished more than 50 games behind the leaders. St. Louis finished $64\frac{1}{2}$ games behind the Yankees.

Comparative Statistics.—The American League supremacy extended to the All-Star game. In the seventh renewal of this game played in the Yankee Stadium, New York, a composite team of American League players defeated a composite National League team by a score of 3 to 1. The game was witnessed by 62,892 persons, and attracted receipts of \$75,701. It was the fifth American League triumph in the seven games played. Through the season the American League maintained its hitting supremacy, particularly in the matter of home runs. American League batters accounted for 796 home runs while the National League sluggers hit 649. The individual leaders in home runs were Jimmy Foxx of the Boston Red Sox with 35 and Johnny Mize of the St. Louis Cardinals with 28. The Yankees contributed 166 to the American League total, leading the league. The New York Giants led the National League with 116.

LIVING MEMBERS of baseball's hall of fame at the centennial celebration in Cooperstown, N. Y., June 12, 1939. In the front row, left to right, are Eddie Collins, Babe Ruth, Connie Mack, Cy Young; In the rear row, Hans Wagner, Grover Alexander, Tris Speaker, Napoleon Lajole, George Sisler, Walter Johnson

The best all-around batting average for the season was made by an American League player, DiMaggio. He finished with a percentage of .381. In the National League, Mize was the batting leader. His percentage was .349. At the finish their standings were as follows:

	Games	At Bat	Runs	Hits	Percentage
DiMaggio	120	462	108	176	.381
Mize	153	564	104	197	.349

Robert Moses (Lefty) Grove of the Boston Red Sox, 39-yr.-old veteran of 15 major league campaigns, had the finest pitching record in the American League. For the ninth time he led the league in earned run average—2.54. For the seventh time his earned run average was under 3.00 per nine-inning game. He ended the 1939 campaign with a lifetime mark of 285 complete games and 286 triumphs, the highest number of victories for any pitcher still active in the major leagues. In the National League, William H. (Bucky) Walters, of the Cincinnati Reds, was the leader on an earned run basis which is the determining factor. He had an earned run average of 2.29, a better showing than that of Paul Derringer, a clubmate, whose average was 2.930, although Derringer's performance in winning 25 games and losing 7 in 38 appearances gave the latter a games won and lost percentage of .781, the highest average on this basis. The comparative standings for the season for Grove and Walters, in games pitched, games credited as won, and games charged as lost follows:

	Games	Won	Lost	Percentage
Grove	23	15	4	.789
Walters	39	27	11	.711

The Minor Leagues.—A highly successful season in the minor leagues concluded with the annual "little world series" in which Louisville, American Association representatives, conquered Rochester of the International League, 4 games to 3. In other minor league competition, Fort Worth, although finishing fourth in the Texas League championship season, qualified for the Dixie world series by winning the play-offs, and won the series from Nashville, of the Southern Association, 4 games to 3. Chattanooga won the Southern Association pennant. Scranton excelled in the Eastern League. Seattle won the championship in the Pacific Coast League, its first flag in 15 years.

College Baseball.—In the Eastern Intercollegiate Baseball League, Cornell and Harvard tied for the championship, each with a record of 9 victories, 3 defeats, and percentages of .750. Dart-

mouth, Pennsylvania, Princeton, Yale, and Columbia followed in that order. In the Western Conference, the "Big Ten," embracing college teams in the Middle West, University of Iowa, which shared championship honours with Indiana university in 1938, won the title.

(J. P. D.)

Basketball. Basketball hit a new all-time high in 1939 for attendance with an estimated gallery of 5,000,000 persons. A total of 196,000 persons saw 14 double-headers in Madison Square Garden. There is hardly a college in the United States boasting one or more quintets that has not realized its share of benefits (financially and athletically) from the game. Standing at the top is the Long Island university team that ran off with 24 consecutive victories in the East, a record never before chalked up by a major college team. In the West the University of Oregon stood supreme, beating Ohio State.

In A.A.U. circles, the Denver Nuggets took the national title after a series of games that brought Phillips university, of Enid, Okla., into the finals, in Denver, where the championship tournament has been held during the past six years. The Galveston (Texas) Anico's won the national title in the women's division of the A.A.U., the team being coached by a woman, Frances Williams, the first woman to coach a championship women's team. A severe loss to basketball during 1939 was the death of Dr. James Naismith, founder of the game in 1891.

There were many inter-sectional competitions, with double-headers that brought the crowds in. The Metropolitan Basketball Writers' Association conducted its second annual national invitation tournament, drawing 50,672 people during three evenings in New York. West Point had its best team in many years, losing only to Ohio State (Western Conference winner) and St. John's, the latter team taking the metropolitan (New York) championship.

In the sectional tilts, Rhode Island State won the New England Conference title for the third year in a row, with an average of 70 points during its 21 game schedule—Chet Jaworski, who shot 477 points, is claimant for national high-scoring honours. Dartmouth repeated its 1938 victory as leader in the Eastern Intercollegiate League, with its sophomore star, Gus Broberg, setting a new league scoring record of 159 points. In the Eastern Intercollegiate Conference, Carnegie and Georgetown finished with a tie.

Bates, Ernest Sutherland (1879–1939), U.S. author and critic, was born at Gambier, Ohio on October 14 and was educated at the University of Michigan and at Columbia university. From 1903 to 1925 he taught successively at Oberlin college, Columbia, and the universities of Arizona and Oregon. Among his works are *Mary Baker Eddy—The Truth and the Tradition*, with J. V. Dittmore (1932), *Hearst, the Lord of San Simeon*, with Oliver Carlson (1936) and *American Hurly-Burly*, with Alan Williams (1937). He also published *The Bible Designed to be Read as Living Literature* (1936). Shortly before his death December 4 at New York city he completed his last work, *American Faith*.

Battleships: see NAVIES OF THE WORLD.

Bauxite. An increasing demand for aluminium has stimulated the production of bauxite in a number of countries that were formerly only minor producers, particularly Yugoslavia, Hungary, Italy, Netherlands East Indies, Greece, and the Soviet Union, but has not yet materially affected the output of the other large producers; the increased output of the last two is largely for

home consumption, but that of the first four goes largely to Germany.

On the average, about 60% of the output is used for metal, while

Bechuanaland Protectorate: see BRITISH SOUTH AFRICA.

Beck, Josef (1894-), Polish soldier and statesman, was born in Warsaw and reared in the tradition of struggle for Polish independence. His father, a lawyer and under-secretary of state, was forced by Russian persecution to settle in Austrian Poland; hence the son was educated in Cracow and Lwow, and at Vienna. In 1914 he enlisted in Pilsudski's Polish Legion, on the disbandment of which he escaped to the Ukraine and in 1918 took an active part in the secret military organization of Smigly-Rydz. In the Polish-Soviet war of 1919-20 he commanded a battery of field artillery, served on the general staff, and

headed a military mission to Rumania. After the war he was a military attaché in Paris, and after the *coup d'état* of May 1926 he was appointed Pilsudski's chief of the secretariat. When the latter became prime minister in 1930, Beck was nominated vice-premier and later in the year he became under-secretary for foreign affairs. On Nov. 2, 1932 he was named minister of foreign affairs; with Smigly-Rydz and Moscicki (*qq.v.*) he was Pilsudski's political heir after the marshal's death in 1935. His ministry of foreign affairs was marked by nimble efforts to avoid foreign entanglements and keep his country free from aggression; he also terminated the 18-year dispute with Lithuania in Aug. 1938. When Germany began to menace Danzig and the Corridor, however, he quickly signed a military understanding, and later a full military treaty (Aug. 25, 1939) with Great Britain. As Poland crumbled under German arms, Beck crossed the Rumanian border September 18 and arrived at Cernauti. With other Polish cabinet members he was interned by the Rumanian Government, first at Craiova then at Brasov, where he became seriously ill.

Beef: see MEAT.

Bee-keeping. The normal annual honey production of about 160,000,000lb. was greatly reduced in the United States in 1939, with many areas reporting 30% to 80% of an average yield. Hot dry weather reduced the honey flow in the buckwheat-growing areas of New York and Pennsylvania and in the orange districts of California. Parts of the Missouri river valley, Nebraska, and Kansas reported normal production. In Canada the yield was apparently about 30% under 1938. The outbreak of war in September did not affect low prices for honey, since there was no sugar shortage. About 1,000,000,000 bees were shipped to northern State and Canadian apiaries during 1939, chiefly in April, May, and June, the U.S. Department of Agriculture reported. Commercial shippers were chiefly in Alabama, Louisiana, Mississippi, Georgia, Texas, and California. By a Government-sponsored arrangement 250 shippers filed open prices with control commissions in an effort to stabilize prices. Package bees sold at 60 to 90 cents a pound; queens at 40 cents to \$1 each. (S. O. R.)

LIVING MEMBERS of baseball's hall of fame at the centennial celebration in Cooperstown, N. Y., June 12, 1939. In the front row, left to right, are Eddie Collins, Babe Ruth, Connie Mack, Cy Young; in the rear row, Hans Wagner, Grover Alexander, Tris Speaker, Napoleon Lajoie, George Sisler, Walter Johnson

The best all-around batting average for the season was made by an American League player, DiMaggio. He finished with a percentage of .381. In the National League, Mize was the batting leader. His percentage was .349. At the finish their standings were as follows:

	Games	At Bat	Runs	Hits	Percentage
DiMaggio	120	462	108	176	.381
Mize	153	564	104	197	.349

Robert Moses (Lefty) Grove of the Boston Red Sox, 39-yr.-old veteran of 15 major league campaigns, had the finest pitching record in the American League. For the ninth time he led the league in earned run average—2.54. For the seventh time his earned run average was under 3.00 per nine-inning game. He ended the 1939 campaign with a lifetime mark of 285 complete games and 286 triumphs, the highest number of victories for any pitcher still active in the major leagues. In the National League, William H. (Bucky) Walters, of the Cincinnati Reds, was the leader on an earned run basis which is the determining factor. He had an earned run average of 2.29, a better showing than that of Paul Derringer, a clubmate, whose average was 2.930, although Derringer's performance in winning 25 games and losing 7 in 38 appearances gave the latter a games won and lost percentage of .781, the highest average on this basis. The comparative standings for the season for Grove and Walters, in games pitched, games credited as won, and games charged as lost follows:

	Games	Won	Lost	Percentage
Grove	23	15	4	.789
Walters	39	27	11	.711

The Minor Leagues.—A highly successful season in the minor leagues concluded with the annual "little world series" in which Louisville, American Association representatives, conquered Rochester of the International League, 4 games to 3. RUANDA and URUNDI, 21,200	3,720	Nianza (Ruanda), Kitega (Urundi), mandated territory united administratively with the Belgian Congo	coffee 3,390 tin 1,384	imp. 62,301 exp. 64,861

Belgian Congo, has his capital at Léopoldville. Policy and the budget of the Colony are subject to a "Conseil Colonial" at Brussels and there is a permanent commission for the protection of natives. A progressive native policy is combined with an economic policy involving close co-operation of the Government with large industrial and agricultural concerns which undertake extensive social work among their native employees. Education is in the hands of "Missions Nationales," mostly Roman Catholic. The missions now claim about 3,000,000 adherents. Health work is also carried out by private organizations as well as Government.

The debt is some 220,000,000 francs. Budgetary deficits are balanced by means of a colonial lottery. During 1939 military expenditure increased, but an expansion of revenue is expected as the colony is a valuable source of war raw materials. The copper production of the Katanga was estimated to reach 114,000 tons in 1939. The production of gold increases year by year.

The central position of the territory adds importance to the expanding system of communications—rail, road, and airways. An air service linking the colony to Europe continues to function during the war, but the inauguration of air lines to Kivu has been postponed. The formation of a second "Parc National" of over 1,000,000 hectares in the Katanga has been authorized. The mandated territory of Ruanda Urundi is part of the colony but has a separate vice-governor with his capital at Astrida. It is important as a source of labour for the Katanga mines. (J. L. K.)

Belgian Congo: see BELGIAN COLONIAL EMPIRE.

Belgium. Area 11,775 sq.mi.; pop. (est. Dec. 31, 1938) 8,386,553; chief towns (pop. Dec. 31, 1938): Brussels and suburbs (cap., 1,004,452), Antwerp (273,317), Ghent (162,858), Liège (162,229). Ruler: King Leopold III; prime minister: Hubert Pierlot; languages: French and Flemish.

History.—A year that was to be a trial for Belgium began with a prolonged ministerial crisis. The issue was the old Flemish-Walloon dispute. The newest Government concession to the Flemings had been the establishment of a Royal Flemish Academy. To this had been appointed as an original member Dr. Maertens, a Fleming who had co-operated with the German invaders in the great war, been sentenced to death in his absence and later been amnestied. His history was disinterred: the ex-servicemen became the spearhead of a popular attack on the appointment and M. Spaak, the Socialist premier of the Coalition Government, was assaulted in the street. When the Liberal ministers came out in favour of the protest the cabinet fell, on February 9.

M. Pierlot, a Catholic senator, succeeded after a fortnight in forming a new coalition, with extra-parliamentary ministers for finance and other departments. Within five days this was defeated over its attempt to enforce cuts in Government expenditure, and early in March M. Pierlot obtained a dissolution.

Simultaneously King Leopold addressed a letter to the premier declaring that the country had been brought to its present pass by the partisan bitterness of politics; that the head of the State was sometimes forced to sanction decisions taken independently of him and that the electors should think of the higher interests of national unity.

The elections resulted in gains for the Catholics (who once more became the biggest party in the chamber) and the Liberals, and losses for the Socialists; but the big sensation was the defeat of the Fascist Rexists, whose representation in the Lower House dropped from 21 to 4.

Immediately after the declaration Dr. Maertens, the occasion of all the trouble, resigned. But the Socialists refused to participate in a new coalition, and a Catholic-Liberal Government was formed, which was soon given special powers to legislate on de-

fence and finance matters.

Belgium had called up reservists in the spring crisis: she called them up again in the autumn. But she also took active steps to avert hostilities.

At the end of August representatives of the Oslo Group of Powers were invited to Brussels to consider the position, and King Leopold broadcast a peace appeal in their name. A few days after, with Queen Wilhelmina of the Netherlands, he offered his mediation, proposing a five-Power conference of Britain, France, Germany, Italy, and Poland. But he made it quite plain, in a later broadcast, in October, that Belgium, though neutral, would fight if she were attacked.

That she might have to fight seemed more than possible in November, when reports spread of German troop concentrations on the Belgian-Dutch frontier. Belgium once more tightened up her frontier defences, for the threat was taken very seriously, and the population were warned how to act if air raids occurred. King Leopold paid a hasty visit to the Hague and made another joint appeal with Queen Wilhelmina. It was later reported that a German invasion of Holland would in fact have taken place on November 11 had not Belgium made it plain that she could not remain indifferent in that event. The peace offer, however, was rejected by the Germans, on the grounds that the statements of terms with which Britain and France had replied to it in themselves already constituted rejections.

There was one more Belgian-Dutch piece of collaboration in the year: over a protest against the Anglo-French export blockade of Germany. And though 1939 passed out amid a new cabinet crisis, M. Pierlot solved it, within the first week of January, by forming a new, and smaller cabinet of "National Union"—this time with Socialist collaboration. (R. Ms.)

Education 1937.—Primary schools 8,657; scholars 960,191; higher schools 293; scholars 83,093; universities (1937-38) 4; students 10,776.

Defence 1939.—Army (inc. air force): 4,671 officers, 85,500 other ranks; mainly compulsory service (longest terms 17 months).

Banking and Finance.—Revenue, ordinary (est. 1939) 11,488,700,000 francs; expenditure, ordinary (est. 1939) 11,583,100,000 francs; public debt (Jan. 1, 1939) 57,334,571,000 francs; notes in circulation (Aug. 31, 1939) 26,496,000,000 francs; gold reserve (Aug. 31, 1939) 18,112,000,000 francs; exchange rate (average 1938) 28-93 belgas = £1 sterling; 5 francs paper = 1 belga.

Trade and Communication.—External trade (merchandise):

BELGIUM: Industrial production index (*The Annalist*)

imports (1938) 23,166,507,000 francs; (Jan.-June 1939) 11,303,000,000 francs; exports (1938) 21,723,953,000 francs; (Jan.-June 1939) 11,222,000,000 francs. Communications and transport: roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 156,762 ton mi.; mail mileage 78,412 ton mi.; newspapers 52,504 ton miles. Shipping (June 30, 1938) 430,600 gross tons; tonnage launched (July 1938-June 1939) 27,600 gross tons; vessels entered, in net tons, (monthly average 1938) 2,497,000; (July 1939) 2,801,000; cleared (monthly average 1938) 2,502,000; (July 1939) 2,803,000; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; wireless receiving set licences (1938) 1,082,200; telephone subscribers, local (1938) 287,323.

Agriculture, Manufactures, Mineral Production.—Production 1938 (in metric tons): wheat (1939) 547,874; oats (1939) 621,062; rye (1939) 385,033; potatoes 3,258,433; coal 29,575,500; pig iron and ferro-alloys 2,464,800; steel 2,212,000; beet-sugar 1,201,631; barley (1939) 89,230; butter 64,150; margarine 59,331; artificial silk 5,800. Industry and labour: industrial production (1929=100) (average 1938) 79.9; (June 1939) 80.7; number wholly unemployed (average 1938) 131,909; (June 1939) 150,921; partly (average 1938) 160,571; (June 1939) 151,540. (W. H. WN.)

Berlin-Rome Axis: see EUROPEAN WAR; GERMANY; ITALY; STRATEGY OF THE EUROPEAN WAR.

Bermuda, a British insular colony 580 miles east of Cape Hatteras, language, English; capital, Hamilton (pop. 1,863). The area is 19½ square miles. The population by the 1939 census was 30,516 (not including 4,907 members of the military and naval forces and tourists), of whom Negroes constitute 63%. The colony has an appointed governor and council and an elected assembly.

In April, Governor Sir R. J. T. Hilyard resigned after a disagreement with the assembly over the latter's refusal to exempt him from the Bermudan law forbidding use of passenger motor cars. He was succeeded by Major General Sir Denis K. Bernard.

The threat of war involving the mother country resulted in increased war preparation throughout the year. A war service census was taken in March; gas defence drills were instituted, and other steps taken. At the outbreak of war in September, a state of national emergency was declared, giving the governor the power to rule by decree. Censorship of the mails was established, and conscription for defence put into effect.

The assembly passed a Trading With the Enemy Act, laying down penalties for trading with the enemy and making provisions concerning enemy property and subjects, as well as other legislation enabling the colony to receive and deal with prize ships which might be brought in. The law proscribing motor cars was likewise repealed.

Regular steamship communication between Bermuda and New York and European ports, normally maintained by British vessels, was seriously disrupted by the war, but service by the United States merchant marine developed with the passage in the United States of the Neutrality Act, which exempted Bermuda from its

restrictions. Early in 1939 Clipper service between the United States and Europe was established, with Bermuda a stopping point, supplementing the already existing New York-Bermuda air service. Early in the year the latter service was marred by the mid-ocean crash of the Imperial Airways flying boat "Cavalier" with the loss of three lives (January 16).

The tourist trade, principal industry of the colony, normally provides an estimated 85% of the revenue. During 1938, 82,062 tourists (95% of them from the United States) visited Bermuda. Outbreak of war in Europe in Sept. 1939, however, precipitated a serious decline. Optimism, based on hopes that Bermuda, unaffected by the war, would attract many of the tourists discouraged from European travel, was not borne out.

In 1938, imports, chiefly foodstuffs, textiles, and manufactured goods, totalling £1,906,688 (from the United States, 43.9%; Great Britain, 29.4%; Canada, 14.6%); exports (including re-exports) were £145,943, 13% less than in 1937, but Bermuda products, chiefly vegetables, flowers, and bulbs, increased 58%, to £452,072. Customs duties comprise 75% of the revenues. Great Britain's reciprocity treaty with the United States (effective in Jan. 1939) resulted in a revenue decline and necessitated curtailment of expenditures. Bermuda has 30 Government-aided private schools (4,907 enrolment in 1937).

(L. W. BE.)

Bernstorff, Johann Heinrich, Count von

(1862-1939), German Count and diplomat, was born November 14 at London, where his father was then ambassador to Great Britain. The younger Bernstorff was later to become councillor to the London embassy, and he served also in Belgrade, St. Petersburg, and Cairo. In 1908 he was appointed ambassador to the United States. After the outbreak of the World War, when Bernstorff was still in Washington, he repeatedly warned Berlin that its espionage in America and its unrestricted submarine warfare would lead to a declaration of war by the United States. He was handed his passport Feb. 3, 1917. After his return to Germany he became ambassador to Turkey for three years, and from 1921 to 1928 he was a member of the Reichstag. After Hitler came into power von Bernstorff went into voluntary exile in Geneva, Switzerland, where he died October 6. He was author of *My Three Years in America* (1920) and *Memoirs of Count Bernstorff*.

Billiards. Billiards in the United States suffered by the lack of major competition throughout 1939. Only one championship, with the professional three-cushion leadership of the world at stake, was determined and following four months of home-and-home matches Joe Chamaco of Sonora, Mexico, emerged the new titleholder. Ten experts, each representing an American city, were in the field and Chamaco, playing for New York city, finished first by the margin of seven games. He won 55 and lost 17 for a percentage of .762. Second place went to Jay Bozeman of Chicago with a mark of .667, while another Chicagoan, Allan Hall, wound up third with .583. Chamaco, succeeding Roger Conti of France to the championship, also accounted for the best performances in the competition. He achieved the highest run, 18, and the best game or shortest number of innings for a single match, 23. Conti, Willie Hoppe of New York, Welker Cochran and Jake Schaefer both of San Francisco, and Kinrey Matsuyama of Japan did not compete. Those who rounded out the field were John Layton of Hartford, Conn., Frank Scoville, Buffalo, N. Y.; Otto Reiselt, Philadelphia; Charles Jackson, Detroit, Mich.; Tiff

Denton, Kansas City, Mo.; Arthur Thurnblad, Kenosha, Wis., and Charles McCourt, Cleveland, Ohio.

There were no balk-line or pocket billiards championship tournaments in 1939, so that existing titleholders retained their leaderships. Cochran at 18-2, Hoppe at 18-1 and 71-2, Schaefer at 28-2 and Jimmy Caras of Wilmington, Del., at pockets continued to rule the professionals. The same held true in amateur circles where, for the absence of competition, all crown-holders remained on top.

Billings, Warren K.: see CALIFORNIA.

Biochemistry. Polysaccharides.—Polysaccharides are made up of numerous simple carbohydrate units. Among the most widely distributed and best studied are starches, glycogens, dextrines, and celluloses.

All of these are polymers of glucose and yet they have different physical and chemical properties. Hence these differences must be due to differences in complexity and structure of these giant molecules.

Lignins are also large molecules which are polymers of small units. The lignins are the non-cellulose constituents of wood. They are distinguished from the celluloses by their greater resistance to solution by strong acids and by the difference in the character of the units.

Proteins.—X-ray analysis, more accurate chemical analyses, studies on protein surface films, and other physical measurements all confirm the view that protein molecules are very large polymers of numerous amino acid units united by peptide linkings.

It is of particular interest to note that the earlier chemical analysis of proteins in terms of amino acid units supports the concept that protein molecules are made up of larger units and that these larger units are in general made up of 288 amino acid molecules occurring in definite frequencies and orders. This is also in part confirmatory of the cyclol theory.

Enzymes and Vitamins.—Enzymes have always been considered and found to be catalytic reagents which have the remarkable property of speeding up certain chemical reactions in a very specific manner at body temperatures. Inasmuch as vitamins also produce profound effects in exceedingly small quantities it is suspected that they might also act as catalytic agents. This has now been established for at least three of the vitamins. When these vitamins are combined with pyrophosphoric acid or with one or more nucleotide groups and/or with specific proteins they yield very specific enzymes of great importance in oxidation-reduction processes in living systems. Thus thiamin, or vitamin B₁ as it is commonly called, when combined with pyrophosphoric acid, yields the enzyme cocarboxylase which is necessary in the removal of carbon dioxide from certain acids by the enzyme carboxylase. This thiamin pyrophosphate is the same as the cocarboxylase obtained from natural sources.

The presence of this form of vitamin in nerve tissue is essential to prevent the accumulation of pyruvic acid and the destruction of nerve fibres as a result of which the symptoms of beri-beri develop.

Riboflavin or vitamin B₂, when combined with pyrophosphoric acid and protein constitutes the "yellow enzyme" which carries out one step in the transfer of hydrogen from certain food stuffs or intermediate products of metabolism to be finally oxidized to water by other enzymes. Nicotinic acid or its amide or the anti-pellagra vitamin, when combined with protein and pyrophosphoric acid, constitutes coenzymes 1 and 2 which are essential for the action of certain dehydrogenases in some of the many transfers of hydrogen from molecule to molecule until finally oxidized to water. It is very probable that other vitamins will also be

found to be catalytic agents and hence should be included under enzymes.

Some of the other vitamins which had been known only by their physiologic effects in preventing certain specific pathologic changes, but which had not been obtained in pure form have now been purified and in part synthesized. Adermin, the rat anti-dermatitis factor, B₆, has been synthesized. It is 2-methyl-3-hydroxy-4,5-bis (hydroxy-methyl) pyridine. Pantothenic acid, long recognized as a widely distributed yeast-growth stimulant, has been found to be the chick antidermatitis factor. Vitamin K, the anti-haemorrhagic factor, has been found to be a naphthoquinone derivative. A synthetic form, 2-methyl-1,4-naphthoquinone, is very effective in preventing haemorrhage in chicks kept on a deficient diet.

Metabolism.—In the field of carbohydrate metabolism the importance of the interrelations between pituitary, pancreas, and adrenals is appreciated more than ever and we are no doubt on the verge of some very important discoveries which may have a profound bearing on the treatment of diabetes mellitus. The discovery that liver tissue contains an enzyme other than amylase which synthesizes glycogen from glucose or levulose and phosphate is a new milestone in our progress in this field.

The use of labelled atoms in metabolism studies has been very productive in confirming older views and in introducing new aspects. Space permits reference to only two aspects. It has been shown that six hours after radioactive phosphorus in the form of inorganic salts is fed to chickens we find radioactive phosphorus very widely distributed in the tissues. The highest concentration of this active phosphorus is found in the liver, kidney, and heart, some in the bones and muscle, and least in the brain. This indicates the extent to which there is an exchange of phosphorus between tissues and blood and thus indicates which tissues are most active. It is surprising to find bone more active than brain tissue.

Equally interesting is the observation that tumour tissue appears to be of the same order of phosphorus metabolism activity as liver and kidney.

The studies with heavy nitrogen have shown that tissue proteins are in constant chemical change; that is, they are continually being partially hydrolyzed, deaminized, and reaminized. The extent to which reamination takes place in mammalian tissues was particularly surprising.

This new method of study has also confirmed earlier conclusions as to the ability of the albino rat to synthesize certain amino acids and its inability to synthesize others. (See also PHYSIOLOGY.)

BIBLIOGRAPHY.—*Annual Review of Biochemistry* (1939); *Cold Spring Harbor Symposia on Quantitative Biology* (1938) contains articles on proteins; *Endocrinology* (1940) contains four papers on carbohydrate metabolism presented at a symposium sponsored by the American Physiological Society at Toronto, April 20, 1939; *Current biochemical journals*. Biography: see AMERICAN LITERATURE; ENGLISH LITERATURE; CHILDREN'S BOOKS; MOTION PICTURES.

Biological Survey, U. S. Bureau of, the Federal wild life service, became a part of the United States Department of the Interior on July 1, 1939, in accordance with President Roosevelt's Reorganization Order No. 2. Established to study relations of birds to agriculture in 1885 in the Department of Agriculture, where it grew from sectional to bureau status, this agency is now in the Federal Department that more than any other is concerned with the conservation of natural resources. Under Dr. Ira N. Gabrielson, Chief, the bureau includes divisions of wild life research, Federal aid in wild life restoration, land acquisition, wild life refuges.

construction and Civilian Conservation Corps operations, game management, and predator and rodent control.

Outstanding in the bureau's work in 1939 was the success in initiating a Federal program to aid States in restoring wild life, by paying 75% of the cost of approved projects. This program, authorized by Congress in 1937, went into effect on July 1, 1938, with an appropriation of \$1,000,000. By the end of the first year 43 States had become eligible for participation and 37 had submitted a total of 87 projects—30 involving research; 28, development of natural conditions; 28, acquisition of lands; and 1, a combination of research and development. An increased appropriation of \$1,500,000 became available on July 1, 1939.

There were 51 new refuges added to the Federal system in 1939 and acreage increases in 25 others, bringing the total to 266 with 13,620,128 acres, including 16 with 4,094,200 acres in Alaska, Hawaii, and Puerto Rico. On December 31 there were 144 Federal refuges for waterfowl, 63 for other migratory birds, 18 for wild life in general, 29 for nongame birds chiefly, and 12 for big-game species. For the fourth consecutive year the bureau's mid-winter waterfowl inventory, in Jan. 1939, showed a steady increase, and investigators found encouraging conditions on the breeding grounds during the summer. Federal regulations governing migratory-bird hunting remained much the same as in 1938. Reports from the sale of Federal stamps required of all waterfowl hunters over 16 showed that 1,002,715 were purchased in 1938, as compared with 783,039 in 1937, 603,623 in 1936, 448,204 in 1935, and 605,001 in 1934, first year of the stamp sales.

On June 3, 1939, a national wild life research refuge on the Patuxent river, within a short distance of the national capital, was dedicated—the first national wild life experiment station of a general nature. (See also BIRD REFUGES; WILD LIFE CONSERVATION.)

Publications in 1939 included the following, in series of the Department of Agriculture: Technical Bulletins 634 and 643, *Food of game ducks in the United States and Canada* and *Food habits of North American diving ducks*, and Circulars 504, 520, and 529, *Early winter food of ruffed grouse in the George Washington National Forest*, *Wildlife of the Atlantic coast salt marshes*, and *Food habits of prairie dogs*. (H. Z.)

Biology: see BOTANY; MARINE BIOLOGY; ZOOLOGY.

Bird Refuges. There are (Jan. 1, 1940) 250 refuges for all forms of wild life, administered by the Biological Survey, in the United States, covering 9,525,926 acres. Of these 239 (4,073,430ac.) are primarily for birds and 11 (5,452,496ac.) are primarily for big-game animals, but accord incidental protection to birds.

As in previous years development work during 1939 was continued through the medium of CCC, WPA, and NYA labour. The rehabilitation of land and water areas for birds has included such measures as the stabilization of water levels, the planting of aquatic plants and food-bearing shrubs and trees, and the construction of nesting islands and upland game bird shelters. Reports from refuges from coast to coast indicated increased breeding or larger concentrations of waterfowl during migration than for many years.

Three additional bird refuges were acquired by easement in furtherance of the program begun in North Dakota in 1935, under which land owners give to the Federal Government perpetual use of their land for wild life conservation purposes. This program now provides for 84 refuges in five States, totalling 145,064 acres. The refuges of this type are small. However, owing to location in the middle western prairie States, which have always contained the most favoured breeding grounds for many kinds of waterfowl in the United States, they are proving very valuable in supplementing the large nesting refuges in these States.

Several areas, purchased by the Resettlement Administration in connection with its submarginal land-retirement program and transferred to the Biological Survey for administration, were made

Federal wild life refuges by Executive order during the year. Among these was the Piedmont Wild Life Refuge, in Jones and Jasper counties, Georgia, embracing 58,400 acres. It provides sanctuary for wild turkeys, of which larger breeding stocks are urgently needed, and bob-white quails. The Carolina Sandhills Wild Life Refuge, in Chesterfield county, South Carolina, containing 50,000ac., will afford protection to wild turkeys, bob-white quails, and other wild life in that State. Another important acquisition was the Necedah Migratory Waterfowl Refuge, containing 40,500ac., in Juneau county, Wisconsin. (See also BIOLOGICAL SURVEY, U. S. BUREAU OF; WILD LIFE CONSERVATION.)

(E. A. G.)

Birth Control. Constant pressure for higher birth rates continued in Germany, Italy, France, and England during 1939. New types of decoration are now bestowed officially on mothers of large families in Germany, and Italy rewards its fertile mothers with medals. Tax exemptions, family grants and other privileges are accorded fathers of large families in both Germany and Italy; bachelors pay higher taxes than married men and all discussion of birth control is taboo. Many population experts believe, however, that the population problem, including its many aspects of differential growth, distribution in relation to natural resources, etc., must have serious consideration if lasting peace is to be achieved following the war now in progress.

England.—The National Birth Control Association at a general meeting in May 1939, officially changed its name to the Family Planning Association, which its Board believes "describes more accurately our functions and the increasing scope of our activities." Lord Horder continues to head the Association. A new chemical contraceptive, the result of research under the Medical Sub-Committee, was announced in January. The British Ministry of Health's Interdepartmental Committee's Report on Abortion was issued in June. It stated that "available facilities for giving contraceptive advice" to women when further pregnancy means danger to life or health "are seriously inadequate to satisfy the need" and urged that this matter be brought forcibly to the attention of local authorities, both as a health measure and as a partial solution of the problem of abortion.

Canada.—The Parents' Information Bureau of Kitchener, Ontario announced that up to 1939 it had advised 100,000 Canadian mothers on contraception, and that 18,000 were advised during 1938.

Bermuda.—Government grants in support of birth control clinics were continued during 1939.

Egypt.—The Egyptian Birth Control Association was organized in Cairo early in 1939.

India.—Work continues under the Family Planning Association; new clinical services continue to be established.

Jamaica.—The Jamaica Birth Control League was formed in March 1939, with Dr. Charles Levy as president and Dr. W. E. McCulloch (Hon. secretary, Jamaica Medical Ass'n) as chairman. Contraceptive service is now available in a number of towns on the island and under the Government Medical Department in one parish.

Scotland.—The Scottish Advisory Committee of the Family Planning Association sent a delegation in June to the Parliamentary under-secretary of State, the secretary of health and the chief medical officer, urging extension of contraceptive advice, under local authorities, as a health measure and as aid in reducing the incidence of induced abortion.

South Africa.—The Department of Health addressed a circular letter to local authorities recommending the establishment of mothers' clinics, service to include contraceptive advice and instruction to married women, in cases where pregnancy would be

detrimental to health. The department is strongly in favour of such service and is providing a grant-in-aid to the South Africa National Council for Maternal and Family Welfare, which has organized a number of birth control centres.

China.—Despite the war the Hongkong Kowloon Maternity and Child Welfare Center reports opening a birth control clinic. Another clinic was established at the Tsan Yuk Maternity hospital. The centre is on Government premises, and is recognized by the Colonial Office.

France.—Stringent laws against birth control continue in force and the recently drafted code of the French family provides family grants, Government bounties for every child born, aid for mothers not working outside the home and loans to peasants who stay for 15 years on the land. More drastic penalties for abortion are to be part of the code.

Japan.—Japan's birth rate, owing to the Sino-Japanese war has dropped to the lowest level in 10 years. The information bureau of the War Office has issued a pamphlet denouncing birth control and late marriage and stressing the need for increasing population, as a means of conducting successfully a long range war.

Mexico.—Birth control, sponsored by the Mexican Eugenics Society, was on the agenda of the Mexican Population Congress, held in Feb. 1939, under the auspices of the Ministry of Gobernacion. Mexican officials at the Congress opposed any reduction in the birth rate and suggested a joint study of the population problem by the Public Ministry, penal courts, health departments, and Ministry of Education.

Puerto Rico.—The case against the defendants in the case of the Puerto Rico birth control clinics was presented to the grand jury in Dec. 1938, and demand was made, by the defendants, that indictments be returned in order that it might be determined whether contraceptive advice, under medical direction, was legal under the statutes passed in 1937. By stipulation the case was presented to U.S. District Judge Robert A. Cooper. In Jan. 1939, he handed down a decision in favour of the defendants, who were found not guilty of the charges against them. The Asociacion pro Salud Maternal e Infantil de Puerto Rico announced establishment of 28 centres for birth control service with 3,851 cases advised.

Russia.—*The Medical Worker*, Moscow, in a special article in January, criticized severely the type of birth control work being done in Russia and urged prosecution of factory officials responsible for the inferior contraceptive materials being manufactured in the U.S.S.R. The article pointed out that birth control was "one of the basic measures in the struggle against illegal abortion." It demanded wider education in birth control and blamed the Commissariat of Health for not supplying clinics with posters, exhibits and literature on the subject.

United States.—Merger of the two national birth control organizations, the Birth Control Clinical Research Bureau, Margaret Sanger, director, and the American Birth Control League, Richard N. Pierson, M.D., president, was effected in Feb., 1939. Mrs. Sanger became honorary chairman of the board and Dr. Pierson, chairman. The movement has been strengthened materially by the amalgamation. The new organization is called the Birth Control Federation of America, Inc., and includes not only the two major organizations with their State affiliates, but the New York City Committee of Mother's Health Centers, heretofore an independent body. The growth of clinics throughout the country has continued and there are (1939) 525 centres. Of these, in October, 203 were supported in whole or in part by public funds, and 141 were located in city or county health departments. During 1939 two southern States established contraceptive service as part of the work of their State departments of health.

Legislation.—One bill to amend and further tighten the Federal

law relating to mailing of contraceptive articles and literature was introduced in the U.S. Congress, but failed to be reported out of committee. State legislation continued to centre on placing prescription and sale of contraceptives in the hands of doctors and druggists. The Government through the Food and Drugs Administration and the Federal Trade Commission proceeded against a large number of firms charged with adulteration, misbranding, and making false therapeutic claims, or circulating false advertising of contraceptives.

Legislation in effect Jan. 1, 1940 will require that the formula of contraceptive jellies, creams, etc., in common with other proprietary articles, be printed on the package in which they are sold.

Legal Action.—In June the Waterbury, Conn. Maternal Health Center, a birth control clinic occupying rooms in the Chase Memorial Dispensary was raided by the police, and two physicians and a trained nurse were arrested, charged with violation of the Connecticut law relating to the practice of contraception. Materials and case records were also seized. In August Judge Kenneth Wynne of the Superior Court of the State upheld the demurrer of the defendants' counsel, agreeing that the State law was defective on constitutional grounds, in that it denied a physician the right to prescribe what he considered best for the health and well being of his patients. The case concerning the disposition of materials seized at the clinic was heard before Judge Frank P. McEvoy, who ordered them destroyed. Appeal was taken and the case is still pending before Judge John A. Cornell.

The U.S. District Court of Appeals for the Second Circuit affirmed the decision of the lower court in the case of *U.S. vs. N. E. Himes*, that contraceptive articles, books and pamphlets have lawful uses and are lawful in the hands of those who would not abuse the information they contain. The Customs Bureau in New York was therefore ordered to release to Dr. Himes the magazines seized, on which the suit was based. Books sent later from abroad and seized by the Customs Bureau in New York, were also released under this decision. (M. Sr.)

Birth Statistics. Birth statistics, when used in conjunction with death statistics, provide a basis by which to measure the natural increase in the population of a community. In order to compare communities with different numbers of population, birth statistics are commonly expressed in the form of birth rates per 1,000 of population. For example, there were recorded 2,287,980 births in the United States during 1938; with an estimated population of 130,215,000 in that year, the birth rate is found to be 17.6 per 1,000. England and Wales had a birth rate of 15.1 per 1,000 during 1938. Coloured persons in the United States experience birth rates much higher than do white persons, the rates per 1,000 in 1937 being 20.6 and 16.6 respectively.

Most countries of Western Europe now have a birth rate of less than 20 per 1,000—a rate which was considered low not many years ago. Thus, the Scandinavian countries, the countries of the British Isles, Belgium, France, Germany, and Switzerland, among others, had birth rates of 20 per 1,000, or less, during the period 1936 to 1938. Countries with the highest birth rates were principally in South America or Asia. The following countries had birth rates of 30 per 1,000, or greater, in the period 1935 to 1938: Chile, 33.9; Colombia, 30.6; Egypt, 43.1; India, 34.9; Japan, 30.7; Mexico, 40.4; Palestine, 42.1; Rumania, 30.6; Venezuela, 33.4. Most of these countries with high birth rates also experience high death rates (see **DEATH STATISTICS**) and high infant mortality (see **INFANT MORTALITY**). Birth rates as high as the foregoing would undoubtedly be found in many populous countries which at present have no adequate system for recording births. Table on page 97 shows birth rates for a number of countries.

Average Annual Birth Rates per 1,000 total population in certain countries for the period 1936 to 1938 and for each year in the United States from 1915 to 1938 and in England and Wales from 1900 to 1938

(a) Average for 1935 to 1937.

(b) Average for 1934 and 1935.

(c) Official data begin with 1915. For years prior to 1933, the birth rates relate to an expanding area within the United States.

Birth rates have been declining rapidly since the beginning of the century in practically all important countries of the world. Thus, England and Wales experienced a decline in the birth rate from a level of 28.7 per 1,000 in 1900 to a point half that, namely, 14.4; by 1933; since then there has been a slight upward movement. The birth rate in the United States fell from 25.1 per 1,000 in 1915, the earliest year of official record, to a low point of 16.5 in 1933; however, by 1938 the rate had risen to a point higher than that for any year since 1931. A long time view of the trend in birth rates may be gleaned from the record for Sweden. Birth rates as high as 35 per 1,000 were common there in the middle of the 18th century. Rates as high as 33 were found even as late as 1861-65. The decline which set in thereafter has been particularly marked since 1920, when the rate was 23.6, by 1938 the rate was only 14.9 per 1,000.

Birth rates can also be computed per 1,000 women of a given age in the population; they are then known as age-specific fertility rates. Such figures vary widely with the age of the mother within the reproductive period of life.

Thus, in the United States during 1937, the fertility rates per 1,000 white females within successive five-year age groups were: 15 to 19 years, 41.3; 20 to 24 years, 118.3; 25 to 29 years, 107.7; 30 to 34 years, 73.4; 35 to 39 years, 43.8; 40 to 44 years, 14.9; and 45 to 49 years, 1.5.

Bledsoe, Samuel Thomas (1868-1939), American railroad president, was born near

Albany, Ky., on May 12. After studying law for a year at the University of Texas he was admitted to the bar in 1890 and began practice at Ardmore, in the Indian Territory which is now a part of Oklahoma. Later he was an attorney in Guthrie, Okla., and Oklahoma City. In 1908 he became a solicitor for the Atchison, Topeka and Santa Fe railway. He was appointed general counsel for the railroad in 1918 and chairman of its executive committee in 1930.

In 1933 he became president. Mr. Bledsoe, who was author of a volume on Indian land laws, died at his Chicago home on March 8.

Blitzkrieg: see LIGHTNING WAR.

Blockade. The maintenance of an effective sea blockade by Great Britain of Germany from 1914 to 1918 contributed in a great degree to the Allied victory. Blockade, by international law, cannot be recognized as legal unless it is rendered effective by force. In short, a blockade in order to be binding must be effective. The rights of visit and search, and contraband cargo are closely associated with the practice of blockade. Prohibition is enforced by a confiscation in the blockaded zone or near the area of operations of all ships and cargoes that attempt to sail to or depart from the prohibited ports or coast in violation of standing orders and declarations of the blockader. "Command of the sea" gives the naval power that holds it the force to blockade an enemy and control his trade. Thereby may a superior naval power not only deny an enemy the use of the sea but also deny neutrals carrying contraband ingress to enemy ports, and by withholding commodities and strategic raw materials reduce materially the fighting strength of a state. In the World War, 1914-18, Great Britain never formally declared a blockade of Germany. This was because it was impossible for the British fleet to blockade Baltic German ports and prevent trade by Scandinavian countries with Germany.¹

Britain's patrol and blockade squadrons went on stations Sept. 3, 1939, following much the same lines as in 1914. Great Britain did not declare a formal blockade, but issued on Sept. 3, 1939 a proclamation of lists of contraband that covered practically all imports to Germany. The term "blockade" as used in both wars is technically incorrect in the legal sense, but suggests the machinery used to bring economic pressure on the enemy of the Allies. On September 9, the British Government stated that "to prevent contraband from reaching the enemy His Majesty's Government will use their belligerent rights to the full."

Guns, ammunition, equipment, food, and all that aids directly military-naval forces were classed as absolute contraband. All goods that might be eventually used for war purposes such as food, fodder, clothing, and so forth, were classed as conditional contraband. Thus British sea power at the outset of the present war commenced to exert an economic pressure by blockade that has been defined as "an act of war carried out by the warships of a belligerent, detailed to prevent access to or departure from a defined part of the enemy's coast." The British Isles occupy an unusually favourable strategic position to permit her superior sea power to control the line of sea communications hording on the North sea.

Blockade in the early days of its exercise was maintained by the close hockade and reached its perfection in the wars of Great Britain against the French Revolution and the French Empire. The blockade of the South by the Northern Navy in the American Civil War was a determining factor in the outcome of that war. But by this time new weapons had begun to challenge the close

¹All assertions or opinions contained in the above article are the private ones of the writer and are not to be construed as official or reflecting the views of the Navy Department or of the Naval service at large.

blockade, that is, the mine, the submarine, and the torpedo. The tactical or close blockade was seriously questioned as to its effectiveness by naval experts after the Russo-Japanese War, when Admiral Togo, the Japanese admiral before Port Arthur, lost two battleships by mines. This was one-third of his major force, and for that reason Togo had to relinquish his tight grip on the port. The long range naval blockade came into effect at the outbreak of the World War 1914-18, and now exists in the present conflict.

Prior to 1914, German naval strategy had been based, in the event of a conflict with Great Britain, upon a general conception that the British Grand Fleet would maintain a close blockade of the Heligoland bight and the German coast on the North sea. This would provide opportunity for German counter-attacks by submarines and highly trained and efficient torpedo flotillas. Thus by attrition of a superior fleet could the near parity be reached that would permit the German High Seas Fleet to engage the British Grand Fleet with reasonable chance of success. The British fleet did not maintain a close tactical blockade, but instead maintained a long range strategical blockade with small craft reporting on movements of the German High Seas Fleet. This form of long range blockade with the British Grand Fleet in a favourable position at Scapa Flow, Scotland, had then as now the following advantages: (a) it does not unduly hazard the British capital ships by attack from enemy surface vessels, submarines, or shore-based aircraft; (b) it permits the British main body to remain concentrated in order to engage in force the German fleet should it emerge in the North sea; (c) it provides greater control of the ingress and egress of shipping to the neutral countries. The disadvantages are: (a) the German fleet may emerge to make sporadic raids on the British east coast and, with luck, return to German bases; (b) such a remote concentration of British forces gives greater freedom of action to German naval units cruising in the North sea.

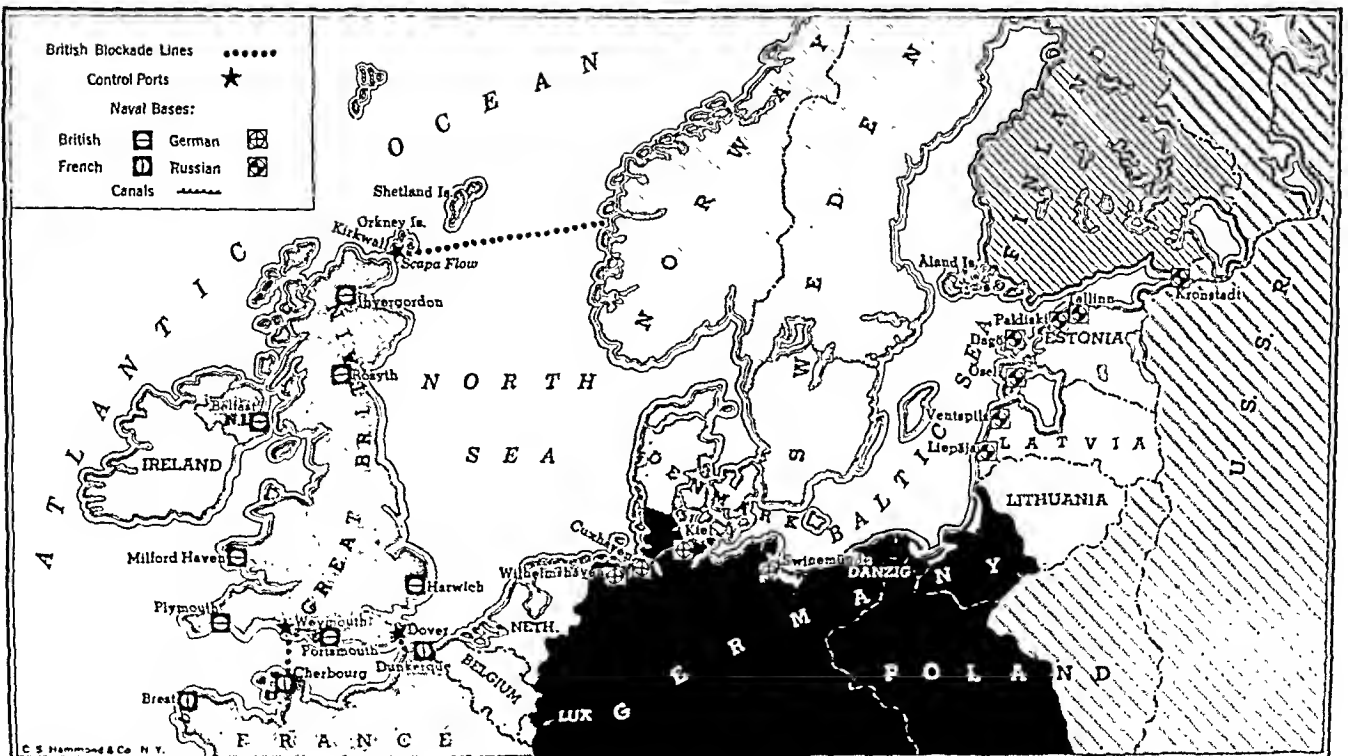

British blockade (Jan. 1940) is maintained by a patrol or reconnaissance force of submarines, destroyers, and planes, close in to

Heligoland bight and the approach to the Skagerrak. Because of the attacks by shore-based German aircraft this is extremely dangerous duty. The British Grand Fleet is concentrated mainly at Scapa Flow and the Firth of Forth, ready for instant action with the German fleet. The straits of Dover are blockaded by mine fields and patrolling squadrons. The British have planted mine fields off Heligoland and from 5° E. Longitude eastward to near the mouths of the Elbe-Weser. The Germans extended this field to the westward. At the year's end, 1939, the British commenced to lay a defensive protective belt of mines to the eastward of England and Scotland from 8 to 10 miles off shore, stretching from Moray Firth to the Thames. A patrol of large armed merchant vessels called auxiliary cruisers is maintained south of Iceland to the Norwegian sea in a general northwest and southwest line. This patrol utilizes a base in the Shetland islands.

The Royal Air Force makes reconnaissance flights over the North sea with regularity and has made several raids on the defended island of Heligoland. The blockade in its entirety has had the general effect of cutting Germany off from nearly all overseas sources of supply. Thus does modern blockade, with a vast organization of air and sea patrols, and a "fleet in being" ready to meet the inferior force of German sea power, propose to maintain for a sufficient length of time an effectual grip and control on shipping in order to effect an economic stranglehold on Germany: the ultimate purpose of which is to undermine the national morale and hasten the decision.

To date, air power has not shown the success that many experts predicted for it in attack on surface vessels. It is perhaps too early in the present struggle to evaluate correctly the capability of air power to maintain or dispute a sea blockade. The potentialities and possibilities of the air arm are known because direct air attacks are now being made on ships by shore-based planes, although to date hits have been few and damage slight. The aeroplane renders great assistance in controlling sea communications by extending the area of vision of surface vessels. Aeroplanes may also attack submerged and surface vessels hundreds of miles from carriers. Blockading vessels must now be ever ready to resist air attack.

BRITISH BLOCKADE lines and control ports. Gibraltar and Halfa are also ports of control for suspected contraband

SUSPECTED CARGO being examined by naval and customs officers for the British contraband control early in Oct. 1939

Naval bases wherein large ships or fleets are concentrated must, in the present war, be provided with air security. Blockades and counter blockades now utilize surface vessels, submarines, and aircraft. Although aircraft has not revolutionized blockade, it has caused air security for blockader and blockaded to become a vital defence requirement.

The control of neutral shipping to enemy ports or contiguous areas requires a highly complicated organization in the modern accepted version of "economic warfare." Before the World War, 1914-18, ships in a blockading squadron searched neutral vessels at sea and there examined the cargoes for contraband. Because under modern conditions, with hostile submarines at sea, it was found practically impossible to search ships at sea, vessels suspected in the World War of carrying contraband to neutrals or to Germany were sent into British ports for inspection. Search at sea was considered inadequate and dangerous because of the hazard to ships stopped of being torpedoed by hostile submarines. The ports destined for such inspections are called control ports. All ships bound for Germany or contiguous neutral countries have been advised to call at these control bases. For example, 48 neutral ships were being held on Dec. 26, 1939, in three contraband control bases in the United Kingdom.

The Ministry of Information announced Sept. 8, 1939 that the British Government had established contraband control bases at Kirkwall, Weymouth, and the Downs (North Foreland) in the United Kingdom, and abroad at Gibraltar and Haifa. Before the end of 1939, the French and British Governments established further control bases at Oran, Marseilles, Malta, Port Said, Aden, Dunkirk, and Le Havre. To assist the blockade, the British decreed that: "Vessels bound for enemy territory or ports in neutral countries from which goods can conveniently be forwarded to enemy territory are urgently advised to call voluntarily at one of the control bases, in the United Kingdom, preferably at Weymouth.

"If they do so and it is established that they carry no contraband, they may be given a pass to facilitate their onward journey."

This important control of cargo inextricably associated with sea blockade is regulated in Great Britain by a Ministry of Economic Warfare, which corresponds closely to the Ministry of Blockade as set up in 1915. This vital offensive arm of economic warfare and blockade had a complete staff drawn from Civil Service and ready to function in the first week of European war. Sea power took the first step by establishing a blockade of the German North sea coast. The Ministry of Economic Warfare was prepared to inspect in port all vessels detained. On Oct. 25, 1939, Ronald Hibbert Cross, the British Minister of Economic Warfare, stated that in the first six weeks of the war, 338,000 tons of goods had been intercepted or detained. All contraband comes under the Admiralty Marshal until a prize court sits and decides the ultimate disposition.

Sea power distributed over stations far from the North sea is utilized for the purpose of maintaining an effective blockade. Three days after Great Britain declared war against Germany, the machinery for operating the contraband control at the strait of Gibraltar commenced to function, for British destroyers began a few days before a state of war existed to patrol the strait, as they had in Sept. 1938. This patrol stopped 30 or 40 vessels of all nationalities passing through the strait each day to examine papers and determine whether or not the ships carried contraband.

Sea blockade has usually led to expedient measures of interpretation of international law on the part of the blockader and retaliatory measures on the part of the blockaded. The Declaration of London of Feb. 26, 1909 (never ratified by the powers) was, nevertheless, prior to the World War, 1914-18, the basis for instructions relative to contraband as given by the principal powers to their navies in the event of war. The United States suggested at the outbreak of the World War of 1914-18 that the belligerents adopt its stipulations as well recognized provisions of international law. Great Britain at that time received accurate information that Germany was receiving large cargoes of grain that were being unloaded in Rotterdam, Holland, and shipped to Germany by way of the Rhine. The Allies then answered the United States by the British Order in Council of Aug. 20, 1914, and the French Declara-

tion of Aug. 25, 1914, that the Allied powers would apply the Declaration of London, but pointed out a marked departure from its stipulations as regards conditional contraband. The decree of Aug. 25, 1914 modified the Declaration in order to give the Allies positive facilities for stopping conditional contraband destined to the various neutral ports of the Baltic and northern Europe. Britain exported considerably to these countries throughout the World War. Restrictions were increased by the Allies in an Order in Council of October 30 that made it incumbent on the owners of captured conditional contraband cargoes to prove that the goods were not destined to the enemy country, although shipped to a neutral state. This Order in Council also set forth a voluminous list of contraband goods, with many items which the Declaration of London stipulated should never be called contraband.

The United States Government in a long note strongly protested and concluded that American trade to the neutral states near Germany was suffering by such illegal restrictions. The British Government replied on Jan. 7, 1915, by forwarding a table of the relative exports from New York to the neutral states and pointed out that exports to Denmark for Nov. 1913 amounted to \$558,000 but were more than \$7,000,000 for Nov. 1914. Great Britain, in this note, also stated that in the American Civil War the United States for the first time applied the doctrine that goods were liable to capture destined to an enemy port even though transshipped from an intervening neutral port. It was also recalled that Prince Bismarck, in 1885, when asked whether or not foodstuffs which were not destined for the enemy forces could be seized, replied: "The measure in question has for its object the shortening of the war by increasing the difficulties of the enemy, and is a justifiable step if uniformly enforced against all neutral ships."

The exercise of the right of search in port was strongly disputed by some neutrals in the World War, 1914-18, but an effective organization comparable to the present Allied "economic warfare" control was finally effected. This Allied blockade organization was later augmented by assistance from the United States after her entry in the war. The main work comprised a study and control of exports and imports of the northern neutrals, as well as negotiation and administration of agreements with these northern states; while throughout, as in the 1939 war, sea power provided the effective control of all shipping.

In 1915, the economic blockade enforced by superior sea power began to tell on Germany. This was one of the main reasons for the first German declaration of submarine warfare which stated that from February 18 onward as a retaliatory measure, all hostile merchant ships met in British or Irish waters would be sunk without regard for the crew or passengers. The economic pressure on Germany became so great and the need of commodities and strategic war materials so pressing that the Emperor of Germany, on Jan. 19, 1917, signed the following order: "I hereby order unrestricted submarine warfare to be commenced on February 1 and to be prosecuted with the utmost energy." This led to the torpedoing of American ships flying the American flag, leading to an incensed American public opinion that caused President Wilson to announce to the Senate on Feb. 3, 1917, that diplomatic relations had been broken with Germany. Three more American steamers were torpedoed and on April 6, 1917, the President of the United States declared that a state of war existed. Thus did the United States enter the war, mainly as a result of Germany's counter blockade measures. The United States then co-operated with the Allies by assisting in the blockade of the Central Powers and by furnishing troops, money, and supplies. The strongest open attack on the 1939 sea blockade by Great Britain of Germany was made by the Soviet Government in a note of Oct. 25, 1939. It declared: (1) that the British contraband lists violated international law, injured legitimate neutral trade, and led to results

comparable to those of air bombing in their effect on the civil population; (2) that the system of controlling neutral merchant ships violated elementary principles of freedom of neutral shipping in wartime; and (3) that the Soviet Government reserved the right to claim compensation for injuries due to these measures. British authorities replied that their methods of economic blockade were legal under international law, and admitted that damages arising from loss of Soviet ships were complicated because of Government ownership of ships and cargoes.

The World War (1914-18) demonstrated the ability of the submarine to act as a powerful counter-blockade weapon. Great Britain was reaching a critical shortage of food because of her merchant ship losses by "U" boats when the United States entered the war in 1917. In short, the German Navy was going behind the blockade and striking at maritime "sinews of war," Allied overseas trade. The adoption of the convoy and escort system, the organized search for "U" boats, and the entrance of the United States in the struggle saved the day.

In the 1939 conflict, Germany's methods of attack, as in 1915-18, on seaborne commerce has been rather closely followed with the addition of the laying of anchored, and possibly drifting, "magnetic" mines by German submarines and aircraft. (See SUBMARINE WARFARE.) The convoy and escort system; numerous patrol units, surface and air; searching for submarines; trawlers utilized for mine sweeping; and the laying of a defensive mine field on the east coast of England and Scotland by the British had, by the end of 1939, greatly reduced the sinkings of Allied and neutral ships.

In any consideration of the 1939 blockade, two points are important. First, Allied sea strategy is based upon keeping the seas clear of enemy ships in order to protect Allied and neutral shipping by controlling all sea communications to the British Isles and France. Second, by means of the blockade, ingress and egress to the Baltic is controlled with the hope of achieving the economic strangulation of Germany. The main German fleet is contained and every attempt would be made by the British to bring it to action if it emerged. Thus is the existing blockade both of the offensive and defensive type. Mahan defined this function of the strategy of the stronger sea power in blockade when he wrote:

Whatever the number of ships needed to watch those in an enemy's port, they are fewer by far than those that would be required to protect the scattered interests imperilled by the enemy's escape. Whatever the difficulty of compelling the enemy to fight near the port, it is less than that of finding him and bringing him to action when he has got far away.

In the past 100 years the technique, and the means of maintaining a blockade have changed considerably, but the classical conception of "command of the sea" remains the essential condition upon which the success of any blockade rests. (See also EUROPEAN WAR; INTERNATIONAL LAW; SHIPPING, MERCHANT MARINE.)

Bohemia and Moravia. These two former provinces of Czecho-Slovakia (q.v.) form since March 16, 1939, a German Protectorate. Their area is 12,525 sq.mi. for Bohemia and 6,533 sq.mi. for Moravia. The population according to the census of Dec. 1930 amounted to 4,472,354 for Bohemia and 2,332,522 for Moravia. The density of population per square mile at that time was 357. The annexation of Bohemia and Moravia by Germany has not been recognized by the United States, Great Britain, and France, and these countries are treated as representing independent Czecho-Slovakia. In this Protectorate

some formal autonomy is left to the Czech Government. The head of the State is Dr. Emil Hacha, the former president of the short-lived Czecho-Slovakia as it emerged from the negotiations at Munich at the end of Sept. 1938. The Czech Government was constituted on April 27 with General Alois Elias as Prime Minister. The real influence in the Protectorate, however, belongs to the German Government which is represented by the Reichsprotektor, Baron Konstantin von Neurath. Under him the secretary of the Protectorate, Karl Hermann Frank, one of the most extremist and ruthless leaders of the former Sudeten German movement, controls the whole political, economic, and cultural life of the Protectorate. The Czech autonomy in all three respects was reduced to a mere shadow.

A systematic policy of Germanization was introduced. Many Czech workers were sent out into Germany, whereas very many Germans settled, as farmers, officials and workers, in the Czech territory. The capital, Praha, had a large influx of Germans, and in Moravia a broad belt at the eastern frontier was densely settled with Germans so as to separate Bohemia and Moravia as the most western Slavs from the Slovaks and other Slav peoples of the east, and to subject them with greater rapidity to the process of Germanization. The German language was introduced as the official language, although the Czech language was tolerated for the transaction of purely internal Czech affairs as a second official language. A large number of new German schools were founded; in all the Czech schools new text books were introduced teaching National Socialist principles instead of Czech traditions. A decisive blow against the Czech people was struck by the closing down of all Czech universities and colleges in Nov. 1939. They were supposedly closed for three years, but their laboratories and libraries were removed to Germany, most of the professors and many students sent to concentration camps, and the intention was clear to deprive the Czechs of the possibility of forming an intellectual leader class, and thus to put them into the position of a helot race, subservient to the German master race. Five of the largest provincial towns, of which four in Moravia, Brno, the capital of Moravia, Olomouce, Moravska Ostrava, and Jihlava, besides Ceske Budejovice in Bohemia, were put under German Commissars after the dismissal of the Czech mayors and town councils. Czech economic life was transformed so as to be purely complementary to the German economic system and to work for its needs.

This policy of Germanization is helped by the complete isolation in which Bohemia and Moravia are held. They are shut off from the outside world, from where no broadcasts or newspapers are allowed to penetrate into the Protectorate. So well protected are the Czechs that travellers, even Germans, need a special permission to enter their territory, a permission only rarely granted. Thus the martyrdom of the Czech people goes on, unobserved by the outside world. All manifestations of Czech nationalism are forbidden. The persecution of the Jews after the model of National Socialist Germany has been introduced against the will of the Czech people into Bohemia and Moravia. They are subjected to restrictions similar to those in Germany, and the transfer of some of them to the Jewish "reservation" in eastern Poland started before the end of 1939. (See also ANTI-SEMITISM.)

In view of this difficult situation the Czechs are trying successfully, so far, to maintain national discipline and unity. They have formed a Party of National Unity which accepts all male Czechs of over 20 years. The efforts of the National Socialists to create a Czech Fascist Party have met so far with only very little success, although these Czech Fascists are heavily subsidized by German funds and helped in every way by the German secret police. Their daily newspaper, *Vlajka*, has a very small circulation, although, of course, the whole Czech press, under strictest control

"THEY WON'T STAY BURIED," remarked Shoemaker of *The Chicago Daily News* when Eduard Benes announced Sept. 6, 1939, that Czechs would form a legion to fight Germany

and much reduced in numbers, has lost much in circulation, for the readers find there only the monotonous news of German propaganda. The small Czech Fascist group concerns itself mostly with anti-Semitic demonstrations and provocative acts. Knowing the ruthless methods of National Socialist suppression of all opposition movements, the Czechs have, as far as possible, shown a remarkable restraint. Only on Oct. 28, 1939, the 21st anniversary of the Declaration of Independence of Czechoslovakia, peaceful manifestations of Czech students turned into clashes with the police. The funeral of a student, who had been a victim of these clashes, led in the middle of November to demonstrations on the part of the students. The result was the execution of a number of students, the imprisonment of thousands of students and intellectuals in concentration camps, and the closing of all institutions of higher education for three years. According to reliable reports, many Czech workers committed acts of sabotage, holding up the production of German armaments.

The outbreak of the European war did not affect the Czechs directly as they remained officially "non-belligerent." Needless to say that all their sympathies were on the side of the Western democracies and that they expected from their victory the liberation from the National Socialist Protectorate. Many Czechs put also, at the beginning, their hope in Russia, because the pan-Slav sympathies are strong and ancient with the Czechs. A large number of Czechs under General Leo Prchala, who had succeeded in escaping from Czechoslovakia in the spring of 1939, fought in the Polish Army. Following the example of the World War (1914-18), the Czechs organized in Bohemia and Moravia a secret underground movement, the Maffia, which prepares the ground for the hoped-for hour of liberation and maintains close contact with the Czech emigration in the Western democracies. The former president of Czechoslovakia, Dr. Eduard Benes, who has lived since Oct. 1938 in Great Britain and in the United States, became the head of a Czechoslovak National Committee, which was organized in the fall of 1939 in France and was officially recognized

by the French Government as the representative of the Czechoslovak peoples. The committee, which is composed of seven members, among them Mgr. Jan Sramek, the former leader of the Czech Catholic Party, was authorized to reconstitute in France the Czechoslovak Army to fight at the side of the Western democracies for the liberation of Bohemia and Moravia. In an exchange of letters of December 20 between the British Foreign Secretary, Lord Halifax, and Dr. Eduard Benes, the British Government recognized officially the committee as representing the Czechoslovak peoples and promised full co-operation in the reconstitution of the Czechoslovak Army. (See also CZECHO-SLOVAKIA.) (H. Ko.)

Bolivia, a South American inland republic on the Southern Andean plateau; language, Spanish; capital, La Paz; provisional president, Carlos Quintanilla; area: 419,470 square miles. The population, as officially estimated in 1937 (on the basis of the census of 1900) is 3,226,965, with 50.9% Indian, 26.8% mestizo (Indian and white admixture), 12.7% white, and 9.6% "unspecified." The chief cities, with populations (official estimates, 1936), are: La Paz, 202,000; Oruro, 44,826; Cochabamba, 36,874; Potosí, 28,492; Sucre, 27,508.

History.—During 1939 Bolivia continued to have the political instability which had characterized her especially since 1930. On April 24, her 35-year old dictator-president, Lieut. Col. Germán Busch Becerra, created an international sensation when he announced assumption of "totality of powers." Suspending the constitution he dissolved congress and the courts and cancelled the congressional elections scheduled for May 4. Although the new move was officially described as "Bolivian in nature" and designed to "redeem Bolivia from chaos," it was generally regarded as indicating a close economic tieup with the totalitarian powers of Europe. On May 12, several leading opponents of the Government were arrested and confined in a concentration camp. On May 25 publicity concerning payments exacted of Jewish refugees by Bolivian consuls in return for valueless "passports" created a scandal and forced the resignation of the foreign minister. His successor resigned, August 3, in protest against the formal nationalization of the Central Bank of Bolivia. Three weeks later (August 23) President Busch died of a gunshot wound. Officially, his death was "suicide," but many observers regarded it as assassination. His minister of war, General Carlos Quintanilla, succeeded as provisional president. The new president pledged restoration of "constitutional normality," and suspended censorship and press restrictions (September 27); presidential elections were called for March 7, 1940. On October 27, however, Colonel Bernardino Bilbao Rioja, commander of the army and an avowed presidential candidate, was deported to Chile "for planning a revolution." Several days of near-revolutionary disorder followed.

Education.—There are more than 2,000 primary schools, with enrolment of around 145,000, and three universities, at La Paz, Sucre, and Cochabamba.

Finance.—The monetary unit is the boliviano (value: approx. 2½ cents U.S.).

Trade and Communication.—External communication is by rail to Arica and Antofagasta (Chile), to Peru by rail and lake steamer (on Lake Titicaca), by rail to Argentina, and by regular air service. There are 1,399mi. of railway in service. An international railway connecting with the Brazilian port of Santos is under construction. The principal highways aggregate over 5,000mi. in length with a further 1,000mi. under construction or in project. Except for 14mi. the Bolivian section of the Inter-American highway (897mi.) was entirely open in 1939.

Exports are 97% mineral (70% tin), and aggregated 94,830,000 bolivianos gold (one gold boliviano=36½ cents U.S.) in 1938

(124,599,000 gold bolivianos in 1937). Imports (manufactured goods and foodstuffs) were 70,559,000 bolivianos (59,234,000 in 1937).

Agriculture and Minerals.—Bolivia ranks third in world production of tin. Silver, tungsten, antimony, lead, zinc, copper, gold, sulphur, and bismuth are also produced in important quantities. Oil resources are only slightly developed. Agriculture falls short of domestic needs. (L. W. BE.)

Bonds. From the American panic of 1873, which had its European counterpart, there was a sustained uplift in Government bond values for 26 years to a zenith in 1899, when prices were double those of the previous nadir. The ensuing 21-year decline to 1920 reached depths not much less than in 1873. The 1914-18 World War may have been responsible for the extremity of that decline. In the U.S. the upsurge since 1920 has continued 19 years to an all-time high point, although technical indications are not wanting of an impending reversal.

However that may be—since the beginning of 1935 the long term Government bonds of the United Kingdom parted price-company with those of the United States and began to decline, so that instead of yielding 2½%, or less than United States bonds, they are now offering a return of around 4%, or nearly twice as much. Charge that reversal of credit largely to war preparation.

Likewise, in the World War (1914-18) the value of British Governments declined from the outbreak of the spring of 1917 in opposition to a moderate advance of United States Governments during the same period when American participation was not commonly expected. But on the entry of the United States into the war the moderate intermediate uptrend of the American national loans was reversed and they declined in close sympathy with British Consols until the long time lows of 1920 and 1921 were realized for both countries. It was the war service of the author to assure the American people on coast-to-coast tours during all the Liberty loans and the Victory loan that the resumption of peace would pave the way for enduring (but not necessarily everlasting) revival of high grade bond values, so that each bond buyer could rely on interest upon the money he loaned the Government and eventual total dollar return of his principal. No such assurance could be given intelligently now for not only has the Government deliberately and without impelling provocation repudiated its countless promises to pay in gold, and has otherwise devalued its money, but also has bolstered its funded debt by over \$20,000,000,000 to the statutory limit—fulfilling a notorious boast "we shall tax and tax, spend and spend, elect and elect."

Nothing can be more certain than that the entrance of a nation into war will more definitely date its credit decline than anything else, nor that, other things being equal, resumption of peace, and of trade, will retard or reverse that decline. If Great Britain and its overseas dominions emerge from the European war retaining their industrial primacy we shall not see the creditors of her funds paid about 4% as now while creditors of the United States are paid about 2%. If the United States enters the war, history and reason lead us to expect that British Consols will decline somewhat further and that Federal Government bonds will decline promptly and exceedingly and will seek a similarly low level.

The post-war future of American Federal credit, whether the country becomes a belligerent or not, is not so simply projected. America emerged from the previous war with what, for it then, was the unprecedented debt of \$25,000,000,000, but one which, thanks to post-war business revival and a national debt-paying tradition abetted for 11 years by the able Secretary of the Treasury, Andrew Mellon, restored the national credit. The funded liabilities were thereby reduced by about \$9,000,000,000.

But the true funded assets of the nation were even more greatly reduced. About \$13,000,000,000 due the United States by European and other nations, particularly before the entrance of the former into the war—credits arising from the sale of exigent supplies charged at punitive prices—were, with the notable exception of Finland, generally voided. Simply it became more convenient to default than to honour, especially as the United States made no noteworthy effort to offer goods at European price levels to facilitate payment. Europe did not have the gold and therefore Europe defaulted.

Under less statesmanlike policies than those which guided Mellon and his contemporaries the Government since the year 1933 has accumulated a still more unprecedented debt now totaling \$41,000,000,000, apart from \$11,000,000,000 of contingent liabilities, by encouraging an artificial credit ease and creating fictitious prices for its bonds. (See also BANKING; STOCK EXCHANGES: *Stocks and Bonds*.) (L. CH.)

Book-collecting. Bibliography is a living and occasionally a lively science. The book-collector of today, in order to prosecute his pursuit intelligently and with the highest enjoyment, must perforce be some part bibliographer. So equally must the bookseller. In America and England alike much of the rare-book trade is now in the hands of alert young men who combine the attributes of merchant and of scholar—a mixture that would once have been regarded as grossly incompatible.

The alliance bore noble fruit in 1934 with the publication of *An Enquiry into the Nature of Certain Nineteenth Century Pamphlets*, by John Carter and Graham Pollard, London booksellers, the former the representative of a New York house. The *Enquiry* exposed as sheer fabrications a quantity of rarities stemming from a common source whereof the most recherché was Mrs. Browning's *Sonnets* (sc. *from the Portuguese*), allegedly issued in 1847. This bibelot has sold for as high as \$1,250.

The Carter-Pollard disclosures, without naming him, pointed at Thomas J. Wise, founder and owner of the Ashley library and compiler of the notable eleven-volume catalogue of that surpassing collection. Wise did not manage his rebuttal effectively; he died in 1937 under a cloud, and his books were acquired by the British Museum.

Late in 1939 another engrossing contribution appeared in Wilfred Partington's *Forging Ahead*, subtitled "the True Story of the Upward Progress of Thomas James Wise, Prince of Book Collectors, Bibliographer Extraordinary and Otherwise." Mr. Partington could say what Messrs. Carter and Pollard could not, and he did. Much technical investigation into Wise's activities remains to be prosecuted; meanwhile his inventions have taken on a certain réclame purely as inventions; in the spring of 1939, although its spurious state was familiar to the whole world of bookmen, a copy of Mrs. Browning's *Sonnets* sold for \$105. The collecting world rejoices in the fact that the exposure was initiated and carried through by booksellers. The fact is abundant proof of the alertness and awareness of the contemporary book trade.

Less spectacular research is continually being carried on, particularly in the large institutional collections. The annual reports of such admirable (and admirably supervised) libraries as the Huntington, the John Carter Brown, the Chapin, the Wrenn, the Clements, and the American Antiquarian Society briefly set forth the activities which are being prosecuted in these great repositories. The *News Sheet* of the Bibliographical Society of America regularly lists a schedule of bibliographical work in progress. At

least two important compilations which were cited as in progress a year ago—Dr. Wilfrid Parsons' *Bibliography of Early Catholic Americana* and Lyle H. Wright's *Bibliography of American Fiction 1774-1850*—appeared in finished form during 1939. (J. T. W.)

Book Sales. War acts both as brake and as stimulus to the collecting activity, and the passage of time is necessary in order to determine whether retardation or acceleration is to be the dominant characteristic. It is significant that the autumn of 1939 found the English rare-book trade devoting as much attention as heretofore to the potential American buyer, even though catalogues bore unfamiliar suburban and even rural addresses. But bibliopoly is one facet of commerce which can be conducted far from the great financial capitals. America itself offers convincing proof of this. The crossroads bookstore has become a familiar phenomenon of the countryside, and while its over-the-counter traffic may be negligible, this is an advantage to the proprietor in that it gives him abundant leisure for the compilation and dispatch of catalogues to the four corners of the nation. It will be interesting to note whether peace will find some of the English dealers continuing to take advantage of the greater space facilities and reduced overhead available well beyond the metropolitan area and the larger provincial centres.

The American auction season of 1938-39, while not without its points of high interest, was in the main a somewhat pedestrian affair. The most expensive offering was the Ormond G. Smith copy of the first folio Audubon *Birds of America* (1832-39), which brought \$11,700. This noble monument to Anglo-American co-operation is proof against the accidents of time and change; if one accepts the "investment book" theory a folio Audubon must fulfill all his requirements, provided he has space to store it, since each of its 400 plates has an area of nearly eight square feet. The *Birds of America*, to be sure, did not initiate its career as a cheap book; the original subscription price just a century ago was \$1,000.

The season just closed also witnessed the unusual offering of a Poe *Tamerlane* (1827). Despite its far from pristine condition—"back wrapper and backstrip lacking, piece torn from top inner corner of front wrapper, affecting border; wrapper soiled; some leaves faintly time-faded or soiled; traces of dog-ears at corners"—it brought \$4,300. No copy had appeared at public sale since the Halsey (1919), which brought \$11,600, although two copies changed hands privately during the 20-year interval at around \$15,000 each. There are rarer books—there are rarer Poes—but *Tamerlane*, deservedly or not, has become the touchstone of American bibliophily, and the announcement of the discovery of an unrecorded exemplar is always breath-taking.

But the book-auction traffic of today is not conducted exclusively in thousand-dollar units. A most encouraging sign of recent months, indeed, has been the growth of small auction houses where sales are consummated at as low as 25 cents. The price-range of books obviously knows no limits in either direction. (J. T. W.)

Borneo, an island in the East Indies, is divided politically into the British protectorate of Brunei; the independent States of North Borneo and Sarawak, both under British protection; and Dutch Borneo.

British Borneo.—Area, total c. 72,000 sq.mi.; pop. (est. Dec. 31, 1938) c. 840,000. Petroleum and natural gas are produced in considerable quantities; in 1934 a concession was granted to the Anglo-Saxon Petroleum Company to prospect in North Borneo,

and operations are proceeding. Large areas have recently been taken for the cultivation of Manila hemp.

Brunei: 2,226 sq.mi.; pop. 36,561 (Malays 30,433); capital, Brunei Town; British resident, J. G. Black; ruler, H.H. Sultan Ahmed Tajudin.

North Borneo: c. 29,500 sq.mi.; pop. 302,174 (Chinese 53,000); capital, Sandakan; governor and commander-in-chief, C. R. Smith.

Sarawak: c. 50,000 sq.mi.; pop. c. 450,000 (Malays, Dyaks, etc., c. 350,000; Chinese c. 100,000); capital, Kuching; ruler, H.H. Sir Charles Vyner Brooke, G.C.M.G. (Rajah); language (official), English; religions, Mohammedan, Buddhist.

Production.—1938: *Brunei*: petroleum 707,219 metric tons; natural gas 3,195,000,000 cu.ft.; cutch (export) 1,695 metric tons; rubber 1,259 metric tons. *North Borneo* (exports): rubber 11,720 metric tons; copra 12,800 metric tons; sago flour 3,718 metric tons. *Sarawak* (exports): benzene, kerosene oil and liquid fuel \$10,988,871; rubber \$7,968,931; gold \$1,113,348; sago flour \$570,793.

Overseas Trade.—1938: *Brunei*: imports \$2,821,799; exports \$6,580,725. *North Borneo*: imports \$6,116,391; exports \$9,525,773. *Sarawak*: imports \$22,371,939; exports \$26,135,097.

Communications.—1938: roads, suitable for motor traffic: *Brunei* 102mi.; *North Borneo* 236mi.; *Sarawak* 101mi.; railways open to traffic (*North Borneo*) 125 miles.

Finance.—1938: Currency: Straits dollar (\$1=2s.4d.)

	Brunei	North Borneo	Sarawak
	\$	\$	\$
Revenue	1,179,979	3,286,831	4,261,899
Expenditure	1,476,725	1,861,373	4,272,140

Dutch Borneo: Area: Western District, 56,664 sq.mi.; Southern and Eastern District, 151,621 sq.mi.; pop. total (census 1930) 2,194,533. Government: under the Governor-General of the Netherlands Indies.

Boston, seaport at the head of Massachusetts bay; capital of the State of Massachusetts, U.S. Population (1930) 781,188 (229,356 being foreign born whites): 1935 (State census) 817,713. Its metropolitan district (U.S. census), including 80 cities and towns, is fifth in population in the United States, (1930) 2,307,897; (1935) 2,385,465. City employees (less schools) numbered 13,116; salaries and wages (1938): \$20,011,952. Three school committee members (4-year term) and 22 councilmen (2-year term) were elected in November (non-partisan) to take office in January. A referenda vote approved State laws permitting the mayor to run for re-election (prohibited since 1918) and providing for a referendum on loans for capital improvements when so petitioned by 12,000 city voters. Mayor Tobin's (Dem.) four year term expires in Jan. 1942.

A rigid economy program and State aid reduced the 1939 tax rate from \$41.30 to \$39.90 per \$1,000 on an assessed valuation of \$1,524,800,000 (decline of \$35,607,500). The State has diverted part of its Highway fund to local highway purposes, undertaken the maintenance of metropolitan highways (\$500,000), and contributed toward the Sumner Tunnel deficit.

Boston maintained 293 school buildings and 6,428 employees, including 4,611 teachers. Enrolment (1939): kindergarten to ninth grade 86,895 (declining since 1933); high school 32,153, special 4,593, teachers' college 283. Expenditures (1939): \$16,486,855.68.

Boston is a leader in health conservation. Six of the 28 hospitals were tax supported. The city is trustee (1938) for 176 funds for civic betterment totalling \$14,071,970 and 19 permanent charity funds totalling \$716,670.93. The 1939 Community Fund raised by 109 institutions in the metropolitan area reached a net total of \$4,527,577.68. The overseers of the public welfare (1939) expended \$13,837,815.53. Cases for week ending December 23

were: dependent aid 14,729; dependent children 3,665; old age assistance 14,262. Welfare cases averaged 4,000 above 1938 while WPA employment fell from 25,000 in January to 18,000 in December. The Boston Housing Authority has started a program of nine housing units in various sections. (Estimated cost \$32,000,000.) The Huntington avenue subway extension employs 2,500 WPA workers. The police force numbered 2,443 officers and patrolmen. Expenditures (1938): \$6,042,355. Fire department employees (91 companies) totalled 1,607. Expenditures (1938): \$4,084,327.

Total bank resources exceeding \$3,000,000,000 and the Federal Reserve bank (first district) make Boston the financial centre of New England. Deposits of the eight largest banks (1938): \$1,147,868,000. Bank clearings (Jan.-Nov. 1939): \$10,416,000,000, a gain of 10.3%. Bank debits (Jan.-Nov. 1939): \$14,208,408,000, a gain of 11.1%.

Boston is the chief U.S. wool market and an important fishing port. Wool receipts (1938): 306,490,000 pounds. Fish landed (1938): 381,745,176lb., value \$7,623,465; (Jan.-Oct. 1939) 249,221,185lb., value \$6,664,450, an 8.6% decline by weight and a 3.6% increase by value. Total commerce of the Port of Boston (1938): 15,880,767 tons (of 2,000lb.), value \$716,683,427; imports, 1,798,064 tons; exports, 321,445 tons; (Jan.-Oct. 1939) imports gained 33.6% in value; exports gained 12.4%. Passenger traffic to foreign ports (1939) totalled 102,271.

Wholesale establishments (1935): 3,330; employees 32,334. Retail establishments (1935): 10,649; employees 60,968; sales \$439,120,000. Manufacturing establishments (1937): 2,311; capital invested \$231,685,903; employees 59,365; total wages paid \$71,363,364; value of products \$423,318,101; average weekly earnings (1938) \$23.54. Indices (average 1925-27=100) read: manufacturing employment (1938) 66.3, (Jan.-Nov. 1939) 74.9; manufacturers' payrolls (1938) 58.6, (Jan.-Nov. 1939) 65; department store sales (Jan.-Nov. 1939) 64.8, a gain of 1.7. Building permits (Jan.-Nov. 1939): \$8,155,369, a decline of 25.5%. The 1940 American Legion Convention is scheduled for Boston. The Veterans of Foreign Wars held the largest 1939 convention.

(S. J. McK.)

Botanical Gardens. The American Association of Nurserymen through a special committee headed by Robert Pyle of the Conard-Pyle Company, West Grove, Pa., issued in July 1939 a pamphlet entitled "A Directory of Botanical Gardens and Arboretums of the United States." It lists the arboretums and botanical gardens by States and gives a brief description of each including such items as date established, acreage, invested capital, annual budget, admission fees, and directors. For United States alone 155 such institutions are described.

The hurricane of the summer of 1938 brought to the Arnold Arboretum the problem of clearing away a large number of fallen trees and of replanting the areas thus denuded. Cities and towns over most of New England lost many shade trees in this storm.

New York Botanical Garden has completed a \$350,000 conservatory, providing a greenhouse each for the following exhibits: flower garden, ferns, succulents, begonias, palms, winter flower show, economic plants and cycads. The garden has also been fenced.

Brooklyn Botanic Garden has completed at a cost of \$30,000 the Dean Clay Osborne memorial, an architectural feature covering over three acres and consisting of a fountain, water basins, seats, and columns. This was made possible by a gift of Mrs. Sade Elizabeth Osborne.

The Shaw Botanical Garden, St. Louis, reports more than 275,000 visitors during the 10-month period Jan. to Oct., 1939. Director Moore also points out the great enlargement of various

units of the garden during his incumbency, beginning in 1912. There are now more than 100,000 sq.ft. of greenhouse space, 450,000 sq.ft. of outdoor gardens, 130,000 volumes in the library, and 1,100,000 specimens in the herbarium.

Europe and Asia.—During 1939 the Royal Botanical Garden, Kew, issued eight numbers, nearly 500 pages, of its *Bulletin of Miscellaneous Information* dealing largely with floras of various tropical countries, other systematic studies, and numerous notes on horticultural topics. W. Robyns of State Botanical Garden of Brussels and Samuel H. Lamb of Hawaii National Park published a preliminary ecological survey of the island of Hawaii in the *Bulletin* of the former institution.

K. W. Dammerman, Directeur des Instituts de Buitenzorg, maintains that 's Lands Plantentuin, which includes the botanical gardens at Buitenzorg, the mountain gardens at Tjibodas, the herbarium and the botanical laboratories, should devote their attention to botanical science as such and leave the technical applications to other institutions—*Ann. Jard. Bot. Buitenzorg*, Feb. 1939. (See also BOTANY; HORTICULTURE.) (W. C.)

Botany. Perhaps one can best get a picture of the activities in the field for the year 1939 by discussing the holiday program of the largest group of plant science workers in the world, the botanical groups of the American Association for the Advancement of Science (A.A.A.S.) supplemented by the mention of some outstanding contributions from elsewhere. The programs of the groups appear in the program of the A.A.A.S. December 27, 1939 to January 2, 1940, Columbus, Ohio. This will give a good idea of the scope of the subject and the problems most emphasized during 1939, but it will not give a measure of the volume of research and publications in the field during the year.

In this program we find the following societies dealing with botanical sciences entirely: Botanical Society of America, American Phytopathological Society, American Society of Plant Physiology, Mycological Society of America, American Society of Plant Taxonomy, and American Society of Horticultural Science. The latter is listed under agriculture but deals exclusively with plants and their pests. Besides these groups that are interested entirely in plants, there are other societies that cover both botany and zoology: the Ecological Society of America and Genetics Society of America. The American Society of Agronomy, not affiliated with the A.A.A.S., deals with many plant problems along with soil problems, also the American Society of Bacteriologists, likewise not affiliated with the A.A.A.S., has the lowest order of plants as its subject of study, although its interests are largely in food preservation, soils studies, medicine, etc. The examination of the organization of scientific societies of other countries or the organization of the departments of agriculture of the U.S. or other countries would likewise indicate the many fields of botanical study and show the lines of greatest activity.

An examination of the organization and programs of two societies of the A.A.A.S., Botanical Society of America and American Phytopathological Society, will indicate scope of work and more important contributions for the year.

The Botanical Society of America consists of the following sections: General section, Systematic section, Physiological section, and Palaeobotanical section.

The General section covered the following topics about plants: morphology, cytology, physiology, sexuality, evolution, production of mutants by use of X-ray, colchicine and acenaphthene, biochemical changes, and nutrient solutions. Two outstanding contributions in these programs were the production of mutants with colchicine by Blakeslee and others, and the discovery of plastids in plant cells that make cellulose particles. The latter may be the outstanding botanical contribution of the year. The Physio-

logical section covered in addition: toxic compounds and antagonism between them, synthesis of glucosides, distribution of vitamins, respiration and protoplasmic streaming, germination of spores and seeds, drought resistance, temperature as a factor in various plant processes, light quality effects, and growth substances or plant hormones. The last topic received a great amount of attention during 1939, occupying the attention of dozens of investigators in U.S.A. and the attention of many in other countries. It has also added much to the knowledge of plant processes and promises great contributions in the future.

In the Palaeobotanical section were contributions to plants of various geological strata, the evolution of plants, structure of fruiting bodies of fossil plants, and to past climatic and stratigraphic conditions. In systematics, contributions were made to local floras, relationships within various families of plants, development of nomenclatures, floras as effected by physiographic features, and variations within species.

The American Phytopathological Society covered the following general topics: defence mechanism and disease resistance, physiological reactions to disease organisms, physiological strains of disease organisms, soil deficiency diseases, bacterial diseases, effect of soil nutrients and reaction on disease, varieties of plants resistant to diseases, seed treatment for disease control, nematode injury, silver salts as fungicides, and virus diseases. A great amount of attention is now being given to virus diseases.

Other Contributions.—Another excellent source of knowledge of contributions made to botany during 1939 is an article by F. E. Denny entitled "Advances in Botany" (*News Edition, Industrial & Engineering Chem.* v. 18, No. 2, 1940). Among the discoveries cited in this review are the following: Kramer (Duke university) shows that drops of water on a leaf do not focus the sunlight within the leaf so as to injure it, but far beyond the leaf. Neff (Iowa State coll.) showed that cut carnations keep better in cold storage and last longer after removal when they are wrapped up partly wilted than when kept in cold storage with stems in water. Lochow (Germany) has found 250 alkaloid free lupine plants out of many million studied. All were white-seeded. Groner (Bucknell) found that water of guttation from *Impatiens sultani* leaves is almost pure sucrose solution. Moewus (Germany) found crocin effective in inducing the motility of *Chlamydomonas* in dilutions of one part in 250,000,000,000 of water. This is minimum concentration of a chemical known to modify plant behaviour. White (Rockefeller Inst.) has shown that plant tissue cultures on the surface of semi-fluid nutrients give no differentiation of tissues but when cultured in fluid nutrients 8mm. below the surface the tissue differentiates into stems and leaves but no roots are formed. Arnon and Stout (Univ. of Calif.) found molybdenum in extreme dilution an essential element for nutrition of tomato plants. Raleigh (Cornell university) found silicon essential for growth of the beet plant. Oat plants (Gilbert and Bradley, Wyo. Agr. Sta.) may accumulate enough potassium nitrate to make the hay fatal to animals. Evans (Pretoria, Africa) found that a single plant of a star grass may cover 8,000 sq.ft. of land due to its ramifying underground stem system. Resistance of plants of grains to heat injury (Laude, Kans. Agr. Sta.) shows a diurnal curve; lowest in early morning and highest at mid-day. New yeast hybrids for breadmaking (Winge and Laustsen, Copenhagen) have appeared. Burrell and Miller (Ohio State university) find leaves of milkweeds very high in vitamin C. Denny's article reports many other interesting and important botanical discoveries for 1939. (See also BOTANICAL GARDENS; HORTICULTURE.) (W. C.)

JOE LOUIS GOES DOWN under a blow from Tony Galento in the third round of their heavyweight championship bout June 28, 1939, at New York city

Bowling. The game has increased in the number of players to 12,000,000, using 160,000 regulation alleys. During the 55 days that Cleveland was host to more than 23,000 bowlers in the American Bowling Congress, the scores were as follows: winner of individual title, Jim Danek, of Forest Park, Ill., with 730; doubles championship, Murray Fowler and Phil Icuss, with the winning total of 1,405; 5-man championship team, Fife Electric Supply Co. of Detroit, Mich., with a score of 3,151.

In women's bowling, the Women's International Bowling Congress champions were: Helen Hengstler, of Detroit, individual winner; 5-woman team, Kornitz Oil Co., Milwaukee, Wis.; 2-woman team, Connie Powers and Bobby Reus, Grand Rapids, Mich.; all events winner, Ruth Troy, of Dayton, Ohio.

The Intercollegiate title was won by the Syracuse university team. Barney Evans and Bill Hofner, of Rochester, N.Y. set a world's doubles mark of 1,517. (J. B. P.)

Boxing. Twenty-five title defences made 1939 a notable year in boxing. The spectacle of Joe Louis, world heavyweight champion, on the floor under a blow, provided the year's greatest thrill. Generally the sport experienced characteristic activity in all standard ring divisions save the flyweight class. Notwithstanding, the sport experienced its abuses. It was investigated in New York, Pennsylvania, Illinois, Michigan, and California. The crowds were not as enormous as in former years. The receipts records at no time were menaced. The year ended with no prospect worthy of comparison with Louis in the heavyweight class, and few, if any, in the lighter divisions.

TONY GALENTO COLLAPSES in the fourth round of his match with Joe Louis and is defeated by a technical knockout

Louis, despite his knockdown, was boxing's outstanding figure. The famed Brown Bomber stood pre-eminently as he has for the past several years, lord of all he surveys. Louis defended his heavyweight title by knocking out, in order, John Henry Lewis, Jack Roper, Tony Galento, and Bob Pastor. His scene of action extended from the Atlantic to the Pacific coast. His reign was questioned only in the struggle against Galento when the despised "Two-ton" Tony, accorded no chance at all by ring followers and critics, staggered the title-holder under a fiery fusillade in the first round, dropped Louis with a boulder-like left hook to the jaw in the third, before succumbing himself to the influence of the Louis punch in the fourth round. Louis knocked out Lewis in 2 min. 29 sec. of the first round of a bout in New York in January. He journeyed to California and there knocked out Roper in 2 min. 30 sec. of the first round in a bout held in April. The Galento battle followed, a June attraction in New York which saw "Two-ton" Tony a helpless human hulk in 2 min. 29 sec. of the fourth round, after providing boxing's biggest thrill of the year. And, in September Louis knocked out Pastor in 38 sec. of the 11th round of a bout in Detroit, the first heavyweight title match scheduled for 20 rounds in modern times and the first heavyweight championship ever waged in Detroit. Louis grossed \$283,986 for his year's labour, boosting to \$1,669,722 his ring earnings since the day back in 1934 when he discarded his labourer's overalls in the Ford plant at River Rouge to take up boxing as a profession. Only Jack Dempsey and Gene Tunney have excelled Louis in ring earnings. The champion's largest purse came from the Pastor battle, which also drew the year's largest gate receipts. Louis received \$118,400 for disposing of Pastor. The receipts amounted to \$347,870, a far cry from the million-dollar gates of another year and era, yet sufficient to provide a handsome profit for Promoter Michael Strauss Jacobs of the Twentieth Century S.C., who directed the affair as boxing's current monopolist. Louis's bout with Galento attracted receipts of \$282,303, a tremendous figure for a title match in which the challenger admittedly had scant chance entering the ring. The Lewis and Roper bouts were indoor attractions, limited in capacity, neither a sell-out.

Billy Conn, scoring two victories over Fred Apostoli and ending the light-heavyweight reign of Melio Bettina of Beacon, N.Y., gained attention as one of the outstanding performers of the year. He won the 175-pound title from Bettina in July and repeated the victory in September when Bettina challenged.

Henry Armstrong, world welterweight champion, was the year's most active champion, with 11 title defences. Naturally not all of these were against first-class challengers. Armstrong, known as "Hammering Henry" because of his tireless style, simply took on all comers on a basis of first-come-first-served. He conquered Baby Arizmendi, Bobby Pacho (twice), Lew Feldman, Davey Day, Ernie Roderick (in London, Eng.), Al Manfredo, Howard Scott, Ritchie Fontaine, and Jimmy Garrison (twice). The one upset to Armstrong's string of victories came in August when he lost to Lou Ambers, Herkimer, N.Y., and relinquished the light-weight title. The decision was roundly disputed, but it was official nevertheless and carried with it one of the three titles which at one time gained Armstrong the distinction of being the only boxer ever to hold three championships at one time. Armstrong had long since forsaken the world featherweight title.

The middleweight championship was a disputed possession. Two champions provided three bouts. Al Hostak, National Boxing Association champion, knocked out Solly Krieger early in the year and in December knocked out Eric Seelig to maintain his N.B.A. position. Ceferino Garcia, Californian, knocked out Fred Apostoli in seven of the most spectacular rounds of the year in New York, to gain recognition in New York and California as title-holder. Joey Archibald, Providence, R.I., retained the featherweight

crown, winning decisions over Leo Rodak, Chicago, and Henry Jeffra, Baltimore. Sixto Escobar, Puerto Rican, made one defence of the world bantamweight title against Kayo Morgan, in an unimpressive battle in San Juan, P.R. in April, and surrendered the title because of inability longer to make the 118-pound weight prescribed as the class maximum. This left the bantamweight championship unclaimed, a condition which also surrounded the flyweight championship in which there has been little or no action for the past several years.

Amateur Boxing.—Amateur and collegiate boxing attracted wider popularity and additional recruits. Amateur Athletic Union sectional, State, and national championships were conducted on a larger scale than ever before. In collegiate boxing West Point retained the Eastern Intercollegiate Association championships; Bucknell won the Eastern Conference title; Louisiana State captured the Southeastern Conference championship, and the University of Wisconsin, winning four individual titles, created a valid claim to a mythical team championship in the National Collegiate A. A., where no actual team title is awarded.

Abroad.—The clouds of war cast their spell over boxing in foreign countries. The sport was practically abandoned in England, France, Germany, Italy, and Spain. What activity continued was on a smaller scale than ever before in Australia where a number of American boxers of ordinary rank made tours before war broke out and made ocean travel hazardous. (J. P. D.)

Boy Scouts. During 1939 the increase in membership of the Boy Scouts of America was 66,188 for the first nine months, bringing the total up to 1,340,950. During the first nine months of the year there were 1,684,469 boys and men participating in the Scout program. Since the Boy Scouts of America was first founded in 1910 through Sept. 1939, 8,808,338 persons have been associated with it.

Outstanding events of the year were Boy Scout participation at the World's Fair Camp in New York and at the Golden Gate Exposition in San Francisco. Scouts maintained a service camp on the World's Fair grounds in which 3,258 Scouts and Leaders took part. The annual meeting of the National Council was held in part at the World's Fair grounds on Boy Scout Day. In San Francisco a Boy Scout camp was not maintained but Scouts were given an opportunity to camp nearby.

About 600,000 boys went to camp some time during the year. Scouts camp by troop and patrols and camping activities include a wide scope of outdoor experience.

Under the leadership of a strong reading program committee, of which Colonel Theodore Roosevelt is chairman, a new reading program was launched. The Seventh National Training Conference of Scout Executives, the professional leaders of the movement, was held in September at Bretton Woods, New Hampshire. Over one thousand professional Scout leaders attended.

Abroad.—During 1939 several international scouting events of importance took place. Foremost among these was the Tenth International Scout Conference which took place in Edinburgh, Scotland from July 26–28 and which, in spite of the gathering clouds on the European political horizon, was well attended, with representatives of most of the Scout Associations of the world registered with the International Bureau.

During this conference J. S. Wilson, honorary director of the International Bureau, presented the Scout membership figures of the world. Since 1937 the total active membership has risen from 2,812,074 to a new high mark of 3,305,149—an increase of 493,075—this in spite of the disbandment of the Scout Association in Austria, the reduction of effective Scouting in what was Czechoslovakia, the disaffiliation of the Boy Scouts Nationaux d'Haiti, and the formation of a Japanese National Youth Organization

which has absorbed the majority of members in the Boy Scouts of Japan (315,776 of this increase represents membership reported by China, for which country no membership appeared in the 1937 statement). Previous to this conference, the World Rover Moot was held at Monzie's Castle near Crieff, Scotland, from July 16–26. Three thousand, six hundred boys from 42 lands took part in it.

Early in the year, Jan. 1939, the Australasian Jamboree took place near Bradfield, Australia. Some 11,000 Scouts were encamped at the Jamboree, most of them from the British possessions, including 25 from England itself, one dozen from South Africa, three or four from Ceylon and India, 40 from Noumea, a dozen from Nauru, and one lone Scout from Canada. Australasia, New Zealand, Victoria, South and Western Australia, Queensland, and New South Wales were also represented.

In 1939, Dr. James E. West, chief Scout executive of the Boy Scouts of America, was elected to the International Committee during the Tenth International Scout Conference. This is a committee which handles the affairs of world scouting in the intervals between Biennial International Conferences. Its headquarters are at London. (J. E. W.)

Brady, Alice (1892–1939), U.S. actress, was born November 2 at New York city, the daughter of a Broadway producer and a Parisian singer and danseuse. She was reared in convents at New York city and Madison, N. J., then studied for an operatic career at the Boston Conservatory of Music. After singing several principal roles in Gilbert and Sullivan operettas she forsook a musical career for the legitimate stage and won her first success in 1912 as Meg in *Little Women*. Probably her most successful stage appearance was as Pennie in *Forever After*, which she played for two years (1918–20). She also starred in such silent motion pictures as *Bought and Paid For* and *The Gilded Cage*. But her greatest fame as a motion picture actress was reserved for her semi-middle-aged roles in sound pictures, such as *My Man Godfrey* (1936) and *In Old Chicago* (1938). For her portrayal of Mrs. O'Leary in the latter picture she received the 1937 Academy award as the best supporting actress. Other motion pictures in which she appeared were *Stage Mother* (1933), *Mind Your Own Business* (1936), *One Hundred Men and a Girl* (1937), *Mama Steps Out* (1937), *Joy of Living* (1938) and *Goodbye Broadway* (1938). Her last motion picture appearance was with Henry Fonda in *Young Mr. Lincoln* (1939). During this time she continued to appear on Broadway and played a leading role in *Mourning Becomes Electra* (1931). She died at New York city on October 28.

Brandy: see LIQUORS, ALCOHOLIC.

Brauchitsch, Walther Von (1881–), German general, was born in Berlin on October 4, the son of a general of cavalry, and was educated in the German capital. He entered a military academy and became a lieutenant in 1900. In 1912 he became an officer of the German general staff and he served in this position during the World War. He was appointed inspector of artillery in 1932, and the following year he succeeded Marshal von Blomberg as commander of the East Prussian army district, which in 1935 was transformed into the 1st Army corps. In 1937 he became commander of the 4th Army group, and in Feb. 1938 after the "army purge" he succeeded Gen. von Fritsch (*q.v.*) as commander-in-chief of the German Army, being promoted at the same time to the rank of colonel-general. Brauchitsch, whose decorations include the Iron Cross, first and second grades, and the House Order of the Hohenzollerns, arrived at the eastern front on the morning of September 1 to direct the German invasion of Poland.

Brazil, a republic in eastern South America and largest independent country in the Western Hemisphere; language, Portuguese; capital, Rio de Janeiro; president-dictator, Getulio Vargas.

Area and Population.—The area is 3,291,416 sq.mi., $7\frac{1}{2}\%$ greater than that of the United States. The population was officially estimated as 43,246,931 in 1937. The great bulk of the population lives on the coastal strip. The north is largely negroid, especially around Bahia, with Indian elements in the Amazon basin. Italian, Portuguese, Spanish, German, and Japanese immigration, in the order named, has been especially heavy in the southern States. The principal cities are: Rio de Janeiro, 1,871,830; São Paulo, 1,167,862; Recife (Pernambuco), 491,078; Juiz de Fora 382,857; São Salvador (Bahia), 369,692; Porto Alegre, 336,504; Belém (Pará), 298,340; Santos, 203,126; Bello Horizonte, 193,706.

History.—Politically, Brazil was quiet in 1939. Ruling by decree, President-Dictator Vargas continued his policy of nationalism and centralization, with emphasis on the development of national resources and industry and improvement of communications. Local powers were further reduced. All State flags were abolished by presidential decree in April, and an administrative department set up in each State to serve as a check upon the governor.

Internal difficulties were primarily with unassimilated immigrant groups, notably the Germans in Santa Catharina State. The president made emphatic denunciation of foreign ideologies and took steps against evaders of the 1938 decree requiring instruction in Portuguese and the teaching of Brazilian history in all schools, which had resulted in the closing of many private institutions. In 1939 over 200 children of German parentage left Brazil to study in Germany; consequently, a decree was issued forbidding children under 18 years to attend schools abroad unless accompanied by their parents. It was further required that all schools other than religious were to be directed by Brazilians. Effective Jan. 1, 1940, textbooks in all Brazilian schools are required to be in accordance with the national program. The Vargas program was supported by the Roman Catholic Church in Brazil with an order that all church services in southern Brazil be conducted in Portuguese. In July, a further decree, aimed at subversive propaganda, provided that all future periodicals published in a foreign language must include a Portuguese translation.

Encouragement of immigration was likewise used to combat the problem of unassimilated Germans in the southern States. There the governor of Santa Catharina opened his State to unlimited Portuguese and North American immigration. Special inducements to North American families to migrate to the cattle, wheat, and cotton regions of southern Brazil were held out, and in March the National Immigration Council voted gift grants of 50 to 75ac. as an encouragement.

A still further evidence of the nationalistic program was noted in the requirement made in April 1939 that all insurance companies operating in the country re-insure their policies with the Government. The eventual objective of this was the nationalization of insurance.

A second feature of the year was the inauguration of President Vargas' "Five Year Plan," an economically important program calling for the outlay of \$50,000,000 annually to develop basic industries and public works, particularly communications, and to improve national defence. Financing of the plan is to be through taxes on exchange transactions and banking profits, by the emission of treasury notes, and by gold exportation. Among the projects given immediate consideration were: development of a Brazilian iron and steel industry, exploitation of the nickel mines of Goyaz, fostering of agriculture in the São Francisco valley,

completion of the Rio de Janeiro-Bahia highway, and enlargement of the nationally-owned Lloyd Brasileiro steamship line.

Among the legal reforms effected in 1939 was a new civil code simplifying and cheapening litigation and a decree (May 1) transferring all labour questions from the regular courts to a special tribunal.

Serious drought affected especially the northern and central sections of the country early in 1939, necessitating transfer of a large part of the population of some areas to the south. Even in the south, the drought effect was such that a material reduction in the 1939-40 coffee crop was anticipated. Rio de Janeiro itself faced a water shortage in November, but timely completion of a new aqueduct relieved the situation.

Tourist traffic to Brazil was augmented during 1939. In February, President Vargas set aside the Brazilian bank of the Alto Paraná river immediately adjacent to the great Iguassú Falls (the largest in America) as the first national park. On November 10, second anniversary of the "New State" (accession of President-Dictator Vargas to absolute power in 1937), there began a nationwide series of celebrations culminating on November 15, the 50th anniversary of the founding of the Brazilian republic. A feature of the elaborate program was the visit of seven "Flying Fortresses" of the United States Army air force.

The year was marked in international relations by the continuation of cordial relations with neighbouring republics. A military mission was exchanged with Uruguay, and a trade treaty concluded with that country. In August Brazilian representatives met with those of Argentina, Paraguay, and Uruguay to discuss customs and exchange problems. Following the disastrous Chilean earthquake of January 24, aid was rushed to the stricken area by plane and by steamer. (See CHILE.)

Until the outbreak of the European war in Sept. 1939, Italy, Germany, and the United States carried on a vigorous rivalry for dominating positions in Brazilian trade and friendship. Italian plans to inaugurate air service from Rome to Rio de Janeiro neared completion. In May, Countess Ciano, influential daughter of Benito Mussolini, visited Brazil briefly on a good-will mission. Meanwhile, Italy was attempting to arrange a barter agreement similar to that with Germany. In June, ambassadors were exchanged by Brazil and Germany after a year of strained relations. In March a formal invitation was issued by Germany asking the Brazilian chief of staff to visit Germany and view the German war machine. This was followed by similar invitations from Italy and other European countries. A subsequent invitation from the United States was accepted, instead, however, and outbreak of European war precluded a subsequent visit to Europe. In May the United States Army chief of staff visited Brazil and spent two weeks in a tour of Brazilian military establishments. The Brazilian chief of staff then accompanied him to the United States, where he in his turn inspected military units throughout the country. The exchange was acclaimed by the press of both countries as a step toward American solidarity.

The most significant event of 1939 in Brazilian relations with the United States was the journey of Foreign Minister Oswaldo Aranha to the United States at the special invitation of President Roosevelt in February and March. The object of his visit was the strengthening of the general trade and financial relations of the two countries, which had suffered as a result of Brazil's inadequate exchange supply, unwillingness of United States exporters to concede long-term credits, and the inroads on Brazilian trade due to Germany's barter system. The defaulted Brazilian debt of \$357,000,000 (held principally in the United States) was likewise discussed. After four weeks of conversations, it was disclosed through an exchange of notes between Señor Aranha and United States Secretary of State Hull that: \$20,000,000 would be loaned

to Brazil to provide adequate exchange; the United States Export-Import Bank would finance future exports through grant of credits; the United States Congress would be asked to approve a loan of \$50,000,000 to the Central Reserve Bank of Brazil; and technical aid would be given to facilitate the development of Brazil's vast resources. Brazil on her part agreed to free exchange, to guarantee North American investors equality with Brazilians, to develop her rubber industry, and to resume service on her bonded indebtedness. The accord, acclaimed enthusiastically in both countries, was regarded as a precedent for similar agreements with other Hispanic American nations. In April a Brazilian representative went to the United States to work out the details of arrangements and to enlarge the United States market for non-competitive Brazilian products. On April 8, President Vargas liberated exchange operations after two years of Government control, and in July a payment of \$1,000,000 was made on Brazilian bonds, pending a general readjustment. Conversations on this latter were interrupted by the outbreak of war in September. In other respects the terms of the Aranha-Hull understanding were generally unfulfilled at the close of the year.

On September 6, Brazil proclaimed her neutrality in the European war. In October, President Vargas reaffirmed neutrality, declaring Brazil lacked both economic and political justification for participating in the conflict. Army officers were ordered to reserve any personal opinions. Meanwhile, the Government assumed control of food prices and forbade profiteering. No rents might be raised without prior permission of Government authority. Brazil's external communications were curtailed by the war, to the extent that shortage of coal necessitated the temporary suspension of some railway service in September. To facilitate external trade several cargo ships were purchased in the United States. The battle of Punta del Este and the subsequent flight of the German pocket battleship "Graf Spee" to Montevideo aroused considerable interest and concern in Brazil, and assurances were assertedly given Uruguay that Brazil would assist her in maintenance of her neutrality. (*See HISPANIC AMERICA AND THE EUROPEAN WAR.*)

Education and Religion.—In 1935 there were 36,661 schools with a total enrolment of 2,862,666. Progress in education has not kept up with the material progress of the country in recent years.

Army and Navy.—The Brazilian regular army numbers 80,000, and is supplemented by 30,000 State troops. Military service is compulsory. The navy, second in Hispanic America, is being rapidly expanded. Six destroyers under construction in England at the outbreak of war in Sept. 1939 were taken over by the British Government.

The navy was active late in 1939 in patrolling the Brazilian coast to protect Brazilian neutrality.

Finance.—The monetary unit is the milreis (value: approx. 5.15¢ U.S.), ordinarily expressed in contos of 1,000 milreis each for large transactions.

Trade and Communication.—Under normal conditions Brazil enjoys excellent external communication. In 1939 the nationally owned Lloyd Brasileiro line enlarged its fleet by the purchase of 10 freighters and four passenger vessels in the United States. Air transport by Pan American Airways connects Brazil with all parts of the Americas. Until Sept. 1939 German, French, and Italian transatlantic service gave connection with Europe, but the German service was suspended at the outbreak of war. Lack of adequate rail and highway facilities within the country is an outstanding weakness. Under the "Five Year Plan" \$62,500,000 is to be spent on development of communications. There are 34,321 km. of railway, which will be supplemented by railroads now in project or under construction connecting the Bolivian oil fields with the Brazilian port of Santos. Another railway, from

Asunción (Paraguay) to Santos, is in project and construction is scheduled to begin in 1940. There are 207,700 km. of highway, of which 87% is unpaved. The 1,867 km. Rio de Janeiro-Bahia highway, and a superhighway from Santos to São Paulo were under construction during 1939. Communication in the Amazon basin is almost entirely by water, supplemented by air transport. Ocean-going steamers are the chief means of communication between the northern and the southern ports.

In 1938 Brazilian foreign trade declined 12.9%. Imports and exports were almost exactly balanced at \$295,388,599 and \$295,558,058, respectively, declines of 10.9% and 14.5%. Germany led the import trade with 25.5%. The United States (25.2%), Argentina (11.8%), and Great Britain (10.4%), followed. Foodstuffs (especially wheat), manufactured goods (principally machinery, automobiles, and railway equipment), and fuel (coal, oil, and gasoline) are the most important imports.

The United States led exports in 1938 (34.3%), with Germany (19.1%), and Great Britain (8.8%) following. Coffee exports ascended to a record volume of 17,208,088 bags, a 41% increase over 1937. Cotton exports advanced 13.7% in volume, but declined 22.2% in value.

In the first eight months of 1939, exports rose 4.4% in value, while imports declined 10.2%, with the United States leading in both. British and Argentine trade with Brazil showed increases while that of Germany declined. After outbreak of war German trade practically was non-existent. The effects of European war were felt in a decline of coffee exports, and an increased demand for cotton, manganese, fats, hides and skins, frozen meats, and vegetable oils.

Agriculture and Mining.—Brazil is primarily and predominantly agricultural. The most important single crop is coffee, of which she produces approximately three-fourths of the world's supply, chiefly in the state of São Paulo. Brazilian coffee is, however, generally regarded as inferior to that of Central America and Colombia, with which it is usually blended after export. Increasing foreign competition and the now abandoned policy of rigid crop control have seriously handicapped the industry. Coffee exports in 1933 aggregated nearly 75% of all exports, but by 1937 the total had fallen to 42.06%. The 1939-40 crop was estimated at 21,861,000 bags. Cotton, second among exports, continued its sensational rise during the first nine months of 1939, with exports approaching the 300,000 metric ton mark, a 50% advance over 1938. Brazil is the world's fifth heaviest producer of cotton, and is second only to the United States in the production of maize, whose crop value approaches that of coffee and cotton. Domestic demand takes practically the entire maize crop. Cacao is also of high importance, and Brazil is second only to the Gold Coast of Africa in its production. Other important agricultural products and the estimated value of their 1937 production are: rice, 703,000 contos; sugar, 664,000 contos; oranges, 351,000 contos; beans, 338,000 contos; manioc flour, 317,000 contos. Mate, or Paraguay tea (called Brazilian tea in Brazil) is also produced on a large scale, although Argentina, once Brazil's best customer, now grows practically all of her own needs. Cultivation of wheat, which constitutes 15% of all imports into Brazil, is being encouraged by the Government. A large export trade in castanha, or Brazil, nuts from the Amazon valley exists. There, too, are produced considerable quantities of vegetable oils and of carnauba wax. Production of carnauba wax, primarily for export to the United States, rose to 15,000 metric tons in 1937, a 92% increase over the average production from 1925 to 1935. The States of Pará and Amazonas possess an estimated 5,000,000,000 board feet of hardwood timber. The estimated value of Brazilian forest production in 1937 was 609,000 contos.

The livestock industry is important, especially in Minas Geraes, Rio Grande do Sul, and Bahia States, and in addition to taking care of domestic needs accounts for almost 10% of all exports. Brazil ranks third in the world in swine-breeding, fourth in oxen, fourth in horses, and ninth in sheep.

An estimated 40% of the world's iron deposits are in Brazil, but lack of coal and inadequacy of transportation have hindered development. Until 1939 there was practically no petroleum field of importance known to exist in Brazil, and the country was obliged to import all of its needs. To make available a ready supply, an arrangement was made with Bolivia in 1938 under which a railroad tapping the Bolivian oil fields would be jointly constructed by the two countries. Oil of good quality but as yet uncertain extent was discovered in Bahia State in Jan. 1939. Land within a 100km. radius was set aside as a Government preserve, and machinery and technical assistance brought from the United States. To reduce heavy gasoline imports, the construction of three refineries at Nitheroy (across the bay from Rio de Janeiro) at a cost of \$2,500,000 is planned. Other undeveloped mineral resources of Brazil include manganese, gold, and nickel.

Manufacturing.—Although in no sense adequate for domestic needs, manufacturing is being encouraged by the Government and its development is one of the cardinal points of the "Five Year Plan." A third of all Brazilian manufacturing activity is carried on within the State of São Paulo. During 1938 and 1939, efforts were made to locate steel mills at Nitheroy. The proposed mills would utilize Brazilian iron resources, but lack of capital, of adequate fuel supply, and of sufficient transportation facilities precluded the project from being brought to a final stage in 1939.

BIBLIOGRAPHY.—J. P. Calógeras, *The History of Brazil*, trans. by P. A. Martin (1939). (L. W. BE.; J. S. Cu.)

Bread and Bakery Products. Improvements in the standard methods of bread making have included the greater use of mechanical equipment and the adoption of formulas that produce more nourishing and satisfactory loaves. Mechanical ovens have been rapidly displacing the older peel ovens. There has been a considerable increase in the use of dry milk solids containing less than 1½% fat, particularly by bakers in the United States. The incorporation of milk solids in bread, together with the use of dough conditioners comprised of calcium salts, has greatly increased the calcium content of modern white bread. Some bakers are also augmenting the vitamin B₁ content of white bread by means of special yeast, or in other ways. Both the sponge and straight dough processes continue to be employed for bread-making, at least in the U.S., although there is a tendency toward greater adoption of the straight dough method in Great Britain. (J. A. To.)

The latest available figures in 1939 for the baking industry were contained in the 1937 biennial census of manufactures. In the latter year there were 17,193 baking establishments in the United States with 239,388 wage earners. The total cost of supplies was \$727,021,811 and the wages paid were \$293,994,425. Value of product manufactured was \$1,426,162,859, of which \$796,708,801 represented bread and other yeast-raised products. In 1939 the number of retail outlets was estimated as 350,000, and approximately 100,000 motor vehicles were employed in the distribution of bread and bakery products.

Breguet, Jacques Eugene (1881–1939), French aeroplane designer and manufacturer, was born in Paris on April 23, the great-grandson of Abraham Breguet, famous French watchmaker. He and his brother Louis entered the Breguet establishment as youths and expanded its business to include the manufacture of electrical and

mechanical equipment. Louis, with the assistance of Jacques, designed the first practical helicopter in 1909. At the outbreak of the World War (1914–18), Jacques Breguet served for six months in the front-line trenches before he was recalled by the French Gov't to manufacture military planes. After the war he founded the Maison Breguet near Paris, a factory which produced some of the nation's best known civil and military aircraft, including the plane in which Costes and Bellonte flew from Paris to New York in 1930. Breguet died in Paris on March 21.

"Bremen": see EUROPEAN WAR: *The War at Sea*.

Brewing and Beer. Sales of fermented malt beverages by breweries in the United States in the 1939 calendar year were 2.7% greater than in 1938 but less than in the peak post-prohibition year of 1937. The following figures show sales of fermented malt beverages in the United States by calendar years since the relegalization of beer on April 7, 1933, in barrels (31 U.S. gals.): 1933 (nine months), 20,469,370; 1934, 39,860,979; 1935, 44,907,715; 1936, 52,942,739; 1937, 55,614,614; 1938, 51,360,340; 1939, 52,723,082.

There is one predominant reason for beer sales in the post-prohibition era being less than in the pre-prohibition era: the tremendous increase in excise tax rates. Prior to prohibition the Federal tax on beer was \$1 per barrel and no States imposed a tax. In 1939 the Federal tax was \$5 per barrel and every State in the Union imposed additional taxes ranging from 50¢ to \$6.62 per barrel. It will be seen, therefore, that beer sales in 1939 were only 6.3% less than in the peak pre-prohibition year of 1913 although tax rates on the product were from 450% to 1,062% higher. However, due to the increase in population from 1913 to 1939 there was a greater difference in per capita beer consumption than indicated by the difference in total sales. Per capita consumption for the two years was as follows: 1913, 22.6 gallons; 1939, 13.3 gallons. In 1939 the breweries of 13 States accounted for 88% of the nation's total sales, five other States accounted for an additional 7.1%, while 25 other States and territories (including Alaska, Hawaii, and District of Columbia) accounted for only 4.9%. No breweries were operated in eight States.

Beer production in the United States is likewise being gradually concentrated in fewer breweries. In the final month of 1939 there were 585 breweries in operation, compared with 627 at the end of 1938 and 667 at the end of 1937. In the peak pre-prohibition year there were 1,413 breweries operated in the United States.

The volume and percentage of beer sold in bottles and cans has increased consistently in the last few years. In 1939, 49.3% of total beer sales was in bottles and cans, compared with 46.2% in 1938, 43.9% in 1937, 38.2% in 1936, 29.5% in 1935, and 25.2% in 1934. This indicates more beer is being consumed in the home.

World Production and Consumption.—World-wide production and consumption of fermented malt beverages, which—due to the World War (1914–18) and prohibition—suffered a sharp drop from approximately 285,000,000 hectolitres in 1913 to approximately 125,000,000 hectolitres in 1920, has shown consistent improvement in more recent years. World beer production of fermented malt beverages for 1933 to 1938, calculated for international purposes in hectolitres (a hectolitre is equal to 26.418 gals.) was 1933, 146,500,000; 1934, 184,300,000; 1935, 197,800,000; 1936, 209,200,000; 1937, 228,000,000; 1938, 230,000,000. The United States, Germany and the United Kingdom—in the order named—were in 1938 the leading producers and consumers of fermented malt beverages, this same rank prevailing in 1913. These three nations combined accounted for approximately 66% of total world beer production in 1938 and approximately 71% in 1913. (J. Du.)

Brick. The revival of the building industry is increasing the demand for all types of building materials to such an extent that brick production in the United States has more

Brick Production in the United States
(In millions)

Type of Brick	1934	1935	1936	1937
Common	1,098.7	1,811.3	2,966.5	3,252.6
Face	305.3	472.6	848.8	937.6
Hollow	6.1	9.1	8.4	5.3
Salt-glazed	?	?	48.6	51.0
Vitrified	113.8	76.9	88.9	90.2
Sand-lime	41.4	61.8	103.2	138.3
Fireclay	395.9	494.9	626.6	728.4
Silica	103.5	149.6	229.3	220.1
Magnesite and Chromite	10.6	12.1	20.4	22.8

than trebled since 1934; preliminary reports indicate a decrease of about 10% in 1938 and a recovery in 1939 to above the 1937 level.

Production in Canada is chiefly common and face brick, with only small amounts of other types, and is mainly from imported clays; total production was 102,670,000 in 1934 and 150,275,000 in 1938, as compared with 463,923,000 in 1929.

(G. A. Ro.)

Bridge, Contract: see CONTRACT BRIDGE.

Bridge, James Howard (1856-1939), American author, was born in Manchester, England on May 8, and was educated at the Grand Lycée in Marseilles. He went to the United States in 1884, where he was editor of the *Overland Monthly* (1896-1900) and *Commerce and Industry* (1902-03). From 1914 to 1928 he was curator of the Frick art collection. He also invented and patented a system of water purification by electricity. Among his works are *A Fortnight in Heaven* (1886), *Uncle Sam at Home* (1888), *Millionaires and Grub Street* (1931) and several volumes on the treatment of water supplies.

He died May 28 in New York city.

Bridges. Since the completion of the Brooklyn bridge in 1883, the successive record span lengths achieved by bridge engineers have been:

Year	Bridge	Location	Type	Span
1937	Golden Gate	San Francisco	Suspension	4,200ft.
1932	George Washington	New York	Suspension	3,500
1929	Ambassador	Detroit	Suspension	1,850
1917	Quebec	Canada	Cantilever	1,800
1889	Forth	Scotland	Cantilever	1,700
1883	Brooklyn	New York	Suspension	1,595½

The Tacoma Narrows bridge at Puget Sound, under construction 1938 to 1940 by the State of Washington Toll Bridge Authority at a cost of \$6,000,000, is a suspension toll bridge of 2,800ft. span, the third longest span in the world.

The Bronx-Whitestone bridge spanning Long Island Sound, costing \$18,000,000 and opened April 29, 1939, in time for the New York World's Fair, is a suspension toll bridge of 2,300ft. main span, the fifth longest span in the world. (The Transbay bridge at San Francisco, completed in 1936, has two suspension spans of 2,310 feet.)

The construction of the "Tor der Welt" over the Elbe at Hamburg, to involve 500,000 tons of steel and to include a 2,296ft. suspension span and an 854ft. plate girder span, was suspended at the outbreak of the war in 1939.

The largest suspension bridge in the British Empire is the First Narrows bridge at Vancouver, B.C., opened to traffic Nov. 1938, and fully completed May 1939. It has a main span of 1,550ft., and cost \$6,000,000. This is a toll bridge, financed with British capital.

The Deer Isle bridge on the coast of Maine, opened June 1939, is a suspension toll bridge of 1,080ft. span. A difficult deep-water foundation problem was solved by lowering completely assembled sheet-pile cofferdams pre-fabricated to fit the rock contours.

The Beit bridge over the Zambezi river at Churundu, Southern Rhodesia, a suspension bridge of 1,050ft. span, was completed in May 1939.

In Vienna, the "Reichsbrücke," a new eyebar suspension bridge of 792ft.

THE BRONX-WHITESTONE BRIDGE in New York city, fifth longest suspension bridge in the world, was opened to traffic April 29, 1939

span, was completed over the Danube.

The historic Menai Suspension bridge in Wales, 580ft. span, built by Telford in 1826, was reconstructed (1939) at a cost of £200,000. A wider roadway for modern traffic was provided with the replacement of the four old wrought iron chains by two chains of high-tensile steel eyebars.

The Sullivan-Hutsonville bridge over the Wabash river, between Indiana and Illinois, completed 1939, is the fifth self-anchored suspension bridge in the U.S. The main span is 350ft., and each cable consists of nine 1½-in. galvanized rope strands arranged in open formation.

The Howrah bridge over the Hooghly river, India, under construction 1938 to 1940, is a cantilever bridge costing £1,750,000.

The Story bridge over the Brisbane river, Queensland, under construction 1935 to 1940 at a cost of £1,600,000, with a cantilever span of 924ft., is a Government-owned toll bridge and the second longest bridge in Australia.

Four new bridges over the Mississippi river, under construction 1939 to 1940, are: at Baton Rouge, La., (cantilever—\$8,500,000—848-ft. span); at Natchez, Miss., (cantilever—\$3,000,000—two 875-ft. spans); at Greenville, Miss., (cantilever—\$4,450,000—840-ft. span); and at Rock Island, Ill., (\$2,500,000—five tied-arch steel spans, two at 539 feet.). All but the last are toll bridges.

The first bridge of the Wichert continuous type was the Pittsburgh-Homestead bridge over the Monongahela river, completed 1937, of 10 arched truss spans including two spans of 533½ feet. Since then seven more Wichert type bridges have been built (1938 to 1940) including one over the Susquehanna river at Havre de Grace, Md., 7,618ft. long, with 36 Wichert truss and girder spans (longest truss spans 456ft.); and one over the Potomac river at Dahlgren, Va., two miles long, including an 800ft.

cantilever span and 25 Wichert spans (longest truss span 350ft., longest girder span 162 feet).

Near Paris, a highway bridge with a record-breaking concrete girder span of 256ft. has been built over the Seine at Villeneuve.

The Raritan river bridge at Perth Amboy, N.J., under construction 1939 to 1940 at a cost of \$4,000,000, is of continuous plate girder construction, including 8 spans of 200ft. and one span of 250 feet. Also under construction 1939 to 1940, one of the approaches to the new Main Avenue bridge in Cleveland has a steel girder span of 271ft. (the longest plate girder span in the U.S.).

A concrete pontoon bridge across Lake Washington in Seattle, under construction 1938 to 1940 by the State of Washington Toll Bridge Authority at a total cost of \$8,850,000, has the pontoon portion 6,560ft. long made up of 24 precast cellular reinforced concrete pontoons, 117 to 378ft. long, 50ft. wide and 14½ft. deep, floating seven feet out of water, with a central 200-ft. opening for ships, provided by a sliding indrawn floating span. A second concrete pontoon bridge is under construction at Hobart, Tasmania.

At Istanbul, Turkey, the Golden Horn is now spanned by a steel pontoon bridge 1,500ft. long. The 24 pontoons, of steel box construction, 82ft. wide, 30ft. long and 12ft. deep, spaced 30ft. apart, support a rigid-frame steel superstructure carrying the concrete deck 52ft. wide. A centre section of four pontoons, moved by tugs, swings open like a gate for passage of vessels.

The Sando bridge over the Angerman river, Sweden, which was to be the world's longest concrete arch span (866ft.), collapsed Aug. 31, 1939, with the loss of 18 lives, due to failure of the falsework centring during pouring of the concrete.

The present list of the world's longest spans is as follows:

Type	Bridge	Location	Date	Span
Suspension (Cable)	Golden Gate	San Francisco	1937	4,200ft.
"	George Washington	New York	1932	3,500
"	Narrows	Tacoma	1940	2,800
"	Transbay	California	1936	2,310
"	Whitestone	New York	1939	2,300
"	Ambassador	Detroit	1929	1,850
"	Delaware River	Philadelphia	1926	1,750

(D. B. S.)

Briquettes, Fuel: see FUEL BRIQUETTES.

Bristol, Mark Lambert (1868–1939), U.S. rear admiral, was born at Glassboro, N.J., on April 17. He graduated from the U.S. Naval academy in 1887. Appointed ensign two years later, he rose through the ranks to rear admiral in 1918. During the Spanish-American war he was stationed aboard the U.S.S. "Texas" and saw active service at the battle of Santiago and other engagements. When the United States entered the World War he first commanded a convoy warship, then was placed in command of the "Oklahoma," battleship division 6, in European waters. In Oct. 1918, he was appointed commander of the U.S. naval base at Plymouth. After the war he was sent to

Constantinople as U.S. High Commissioner to Turkey, where he successfully guarded the interests of the Allies and won the friendship of the rising Nationalist party and its leader, Mustafa Kemal Pasha. His skill in diplomacy during his tenure as high commissioner from 1919 to 1927 brought him a special citation from Sec'y of State Hughes. From 1927 until 1929 he was commander-in-chief of the U.S. Asiatic fleet, with the rank of admiral. He retired in 1932 and died at Washington, D.C., on May 13.

British Borneo: see BORNEO.

British Columbia, the western Province of the Dominion of Canada, covers an area of 366,255 sq.mi., being equivalent in size to the United Kingdom, France, Holland, Belgium, and Denmark combined. The population of the Province (1938) is approximately 761,000. About 50% of the population is concentrated in the south-western part of the Province, mainly in the cities of Vancouver, Victoria, and New Westminster. Of this population about 47,900 are orientals, 26,300 being Japanese and 21,600 being Chinese. About 90% of the Japanese and 60% of the Chinese in Canada reside in this province.

History.—Prominent events occurring in this most westerly Canadian Province during the early months of the year included: the opening of a Provincial exhibit at the Golden Gate International Exposition at San Francisco; the appointment of two Provincial representatives to the Canadian section of the International Commission studying the proposed British Columbia-Alaska Highway; and the official opening of the new Vancouver hotel in Vancouver under the joint management of the Canadian National and Canadian Pacific railways in May. The most colourful and arresting event of the year came in June, when His Gracious Majesty, King George VI, and His Gracious Consort, Queen Elizabeth, visited the Province in the course of their nation-wide tour.

Marketing methods of certain wholesale fruit agencies, charged with malpractices by Okanagan fruit growers, were investigated by Dominion Combines Commissioner F. A. McGregor during the summer months. In December, Provincial Attorney-General G. S. Wismer announced legal proceedings would be instituted against several firms named in the commissioner's report. In August, leading oil companies obtained an injunction restraining the Provincial Coal and Petroleum Commission from enforcing an order imposing a three-cent cut in the wholesale price of gasoline. At the close of 1939, the case—which has attracted Dominion-wide attention—was still before the Supreme Court of Canada.

Soon after the outbreak of hostilities in September, Premier T. D. Pattullo informed the Dominion Government that British Columbia would extend full co-operation in advancing war measures. Presenting his budget to the Legislative Assembly in December, Finance Minister Hon. John Hart stated that the national income should be reserved as much as possible for the prosecution of the war and, accordingly, no new provincial tax measures were to be introduced, nor would the Provincial Government challenge the Federal incursions into tax fields considered a Provincial domain at this time. While rejecting a plea that the Province should absorb the whole cost of education, the Finance Minister promised a comprehensive study of municipal finances after the recommendation of the Rowell Commission on Dominion-Provincial Relations had been made known. Estimating that Provincial revenues would reach \$29,300,141, and ordinary expenditures \$29,268,799, compared with an estimated revenue of \$28,820,641 and expenditure of \$28,765,457 in the preceding year, Mr. Hart forecast a revenue surplus of \$31,350 in the fiscal year ending March 31, 1941. Favourable geological reports from the Peace river area prompted the Provincial Government to ask for an appropriation to enable oil-drilling operations to be carried on in 1940. Other

measures passed by the legislature included: several statutes safeguarding property rights and other privileges for persons serving in His Majesty's forces; provision for the regulation of motor carriers and their tariffs by the Public Utilities Commission; the appointment of Justice D. A. MacDonald as commissioner to investigate Doukhobor lands, under mortgage foreclosure action, acquired by the Provincial Government.

In December, Hon. C. S. Leary succeeded Hon. Frank McPherson as Provincial Minister of Public Works; and western representation on the Dominion War Supply Board came with the appointment of W. C. Woodward, Vancouver merchant.

Industries.—Lumber shipments to the United Kingdom surpassed all previous records in 1939, in spite of shipping difficulties which followed upon the outbreak of hostilities. All basic industries, according to preliminary estimates, registered gains over the preceding year. The gross value of production amounted to \$50,500,000 in agriculture (1938, \$47,782,012); \$18,725,000 in fisheries (1938, \$18,725,591); \$75,000,000 in forestry (1938, \$67,122,000); and \$64,939,000 in mining (1938, \$64,485,551).

(G. N. P.)

British East Africa. Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table below. See **BRITISH EMPIRE** for population, capital towns, status, and governors. (See also separate heading, **RHODESIA**.)

History.—*Kenya, Nyasaland, Uganda and Tanganyika territory.* Earlier events in East Africa have been overshadowed by the outbreak of war. The neutrality of other colonial powers indicates that East Africa's role will be in the economic field.

The governor of Nyasaland was appointed liaison officer to the East African Command at Nairobi. In Tanganyika Nazi elements among the Germans (who number about one-third of the European population) were active before the outbreak of war. The internment of Nazi men was carried out without incident. Women and children were allowed to remain free and many Germans left the country.

British Somaliland. The wealth of British Somaliland is in its

stock, and, in spite of schemes for water development and conservation and for the improvement of stock and of pastures, already in progress, the severe drought early in 1939 did considerable damage, the losses in cattle being estimated at not less than 50%, though goats, sheep and camels suffered less. Government relief measures were introduced. Agriculture also suffered and many cultivators were compelled to eat the seed grain required for next season's sowing.

Zanzibar Protectorate. The outbreak of war found the Zanzibar Protectorate well prepared to increase self-sufficiency in food-stuffs. Extensive work had already been done by the experimental station in search of suitable crops for local planting, and the failure of the 1938 clove crop had given the Government an opportunity to encourage food planting, large quantities of maize, rice and bean-seeds being issued free to producers. Attention is also being paid to the improvement of the quality of stock and poultry. Owing to growing competition in the clove industry, new export crops must be found; and the development of the castor-oil plant and of pineapple canning is under review.

Mauritius. The drought of 1938-39 in Mauritius caused a fall of over 75,000 tons in the colony's sugar crop and a loss in wealth of more than £750,000. Concentration on sugar production has had grave economic consequences; for the prosperity of the colony depends on world sugar prices, the cultivation of the crop does not provide work throughout the year, and 90% of food and other requirements have to be imported. Labour unrest at the beginning of 1939, which led to the suppression of the Mauritius Labour Party, was quieted when the Government took steps to ameliorate conditions generally.

Seychelles. Early in 1939 the Seychelles Government purchased about 4,000 acres of land on Mahé (almost a fifth of the mainland). These estates offer a field of investment for the colony's surplus funds, give the Government direct control over the afforestation of mountain reserves, and provide the basis for a scheme of land settlement; in war-time they give opportunity for the planting of essential food crops for local consumption. Road development, the entomological control of coco-nut pests, and the completion of a central distillery for the processing of essential oil crops were fortunately well advanced before the war broke out.

British East Africa

*Estimates, Dec. 31, 1937.

British Guiana, a British colony in north-eastern South America; language, English; capital, Georgetown; governor, Sir Wilfred E. F. Jackson. The area is 89,480 sq.mi.; population, 310,933 (census, 1931); (official estimate, 1938, 337,521), of which 42% are East Indians, and 39% Negroes. The chief cities are Georgetown, 67,584; New Amsterdam 9,514.

Late in Feb. 1939, the colony experienced serious rioting, the outgrowth of a strike of sugar workers. Three persons were killed. At the outbreak of the European war, British Guiana, in common with other parts of the British Empire, took steps to strengthen its defences.

The most significant event of the year, however, was the report of the British Guiana Refugee Committee named in 1938 to study the possibilities of large scale colonization of political refugees in the colony. In April, after studying an area of 25,000 sq.mi. in extent, the Commission recommended that, although the territory was not "ideal" for Middle Europeans and was not suitable for "immediate large-scale settlement," nevertheless, trial settlements involving 3,000 to 5,000 settlers should be started, and the supervision of adequate technicians and specialists be accorded. Cost for two years was roughly estimated at \$3,000,000. Outbreak of war in Europe, however, precluded immediate action. There are 79mi. of railway, 322mi. of main highways, and several navigable rivers. In 1938 imports, comprising foodstuffs, manufactured goods, and lumber, totalled \$10,620,972, largely from Great Britain (50%), Canada (15%), and the United States (11%); exports, largely sugar products (61.6%), bauxite (15.1%), gold (7.7%), rice (4.3%), with some diamonds, aggregating \$13,327,301, went to Canada (53%), Great Britain (34%), other parts of the Empire (5%), and the United States (4%). The export commodities are the principal products. Sugar production provides direct employment for 33% of the wage earners. The monetary unit is the dollar, approximately equal to the United States dollar. There were 239 primary schools (1938 enrolment: 53,373) and seven secondary schools, maintained at a cost to the Government of \$508,894. (L. W. BE.)

British Honduras, British colony in northern Central America; language, English; capital, Belize (pop. 16,687 in 1931); governor, Sir Alan C. Maxwell Burns. The area is 8,598 square miles. The population (1931 census: 51,347) was officially estimated at 57,767 as of Dec. 31, 1938. The col-

ony's boundaries have been long regarded as settled under a treaty with Guatemala in 1859; however, agitation in that country for the treaty's nullification and the eventual annexation of British Honduras was strong throughout 1939, although it had little effect in British Honduras. The colony has direct steamship communication with New Orleans, Jamaica, Liverpool, and other points. Air service to the outside is maintained by a Mexican line to Mérida (Yucatan), connecting with the Pan American Airways system. Domestic air service connects Belize with several interior points. There are 25mi. of railway and over 200mi. of motor highway, but rivers are the chief means of internal transport.

British Honduras is an important trade intermediary between southern Yucatan and the United States, with re-exports valued at \$1,557,110 in 1938. Total imports in 1938 were \$4,004,091, from the United States (30.8%), Mexico, including re-exports (24.6%), and Great Britain (19.1%); exports totalled \$3,263,384, to the United States (72.9%) and Great Britain (12.7%). Principal exports are mahogany and other logwood, chicle, and bananas. These commodities, rice, sugar, and citrus fruits, are the principal products. The monetary unit is the British Honduras dollar (value: approx. \$1 U.S.). The colony has 106 elementary schools (78 maintained with Government aid), with a total enrolment of 10,021 in 1938, and five secondary schools with 456 enrolment.

(L. W. BE.)

British Legion. The legion, founded in 1921 by the late Field Marshal Earl Haig, has a membership of over 500,000, now organized in 4,412 branches, with a women's section of 1,800 branches. Through its 4,000 local benevolent committees it cares for all ex-Service men, and proposes to include those from the European war of 1939. The various centrally controlled organizations continued their work during the year; 200 pensioners were added to the 2,000 already receiving 10s. a week from the Pension Fund; and in many districts branches gave personal support to the National Defence Companies, the Auxiliary Fire Service, etc., and undertook Air Raid Precautions organization with much success. Nearly 400 disabled men are permanently employed at Richmond in the making of the 44,000,000 poppies annually required for Armistice—or Remembrance—Day, and it was announced in October that the collection on that day in 1938, namely £578,188, was a record and that nearly £7,632,500 had been collected in this way since the start in 1921.

At the beginning of August a party of nearly 1,100 visited Paris at the invitation of the French ex-Service organization and Government in commemoration of the 25th anniversary of Britain's entry into the World War.

British Medical Association. A national conference on the wider aspects of nutrition was held in London April 27-29. The discussion centred mainly on the section of the population whose wages are insufficient to provide the necessary supply of vitamins and calories, but it also touched on the wider problem of those who can feed themselves adequately, but choose the wrong foods and cook them badly. In addition to medical men the conference was attended by representatives of agriculture, at home and overseas, industry, and education.

British Pacific Islands: see PACIFIC ISLANDS, BRITISH.

British Possessions in the Mediterranean.

These comprise Cyprus, Gibraltar, and the Maltese islands of which the table below gives certain essential statistics. Sir Richard Palmer, whose term of office as Governor of Cyprus was extended until April 20, 1939, was succeeded by W. D. Battershill, who arrived in Cyprus on August 10. The demand of the Cypriots for self-government continued unabated; but their loyalty to the Empire was proved by the thousands of recruits who, after the outbreak of war, volunteered for service in the British Army. A light railway was brought into operation to bring ore from the Kalavaso mine to the coast; and schemes were put in hand by the newly established Irrigation Department.

Sir Edmund Ironside resigned the governorship of Gibraltar in June to become Inspector-General of Oversea Forces. He was succeeded by Lieut.-Gen. Sir Clive Liddell. The Spanish situation necessitated certain military precautions and led to some regrettable incidents; but on September 28 the governor received a friendly official visit from the Governor of Algeciras.

The new Maltese constitution was promulgated on February 25. It provides for a Council of Government with 10 elected members, 8 official members, and 2 nominated by the governor. Business is to be conducted in English, but at the governor's discretion Maltese may be used. The Council opened on July 31, with 6 Constitutionals, 3 Opposition Nationalists, and one Labour member elected. On September 20 a bill was passed providing for a territorial force for Malta.

History.—The High Commission territories of Basutoland, Bechuanaland and Swaziland are governed by resident commissioners under the direction of the High Commissioner for South Africa. During 1939 Sir E. Harding was appointed High Commissioner to succeed Sir H. Clarke. All those territories are largely dependent on the economic system of the Union of South Africa: large numbers of the adult male population work in the Rand gold mines.

The Basutoland expenditure on education amounts to about 21% of the total expenditure, and as the main occupations of the people are agriculture and animal husbandry, attention is paid to the training of demonstrators in these subjects. Soil erosion is widespread: the Colonial Development Fund has granted a loan of £160,233 for anti-erosion measures. A geological survey is being undertaken, financed by the Colonial Development Fund in the hope of finding coal to take the place of cattle manure as fuel and so benefit agriculture. The people of Bechuanaland are largely pastoral.

Gold and silver are produced in the Tati district. The output of 191,111 oz. of gold in 1938 constitutes a record. The Bechuana people show enthusiasm for education and in 1939 set aside more than 40% of the revenue of their Native Treasury for this purpose.

Basutoland.—Principal products, 1938 (in metric tons): wheat, 23,384; maize, 791,352. Imports and exports, 1938: imports, £749,000; exports, £402,000. Roads, 502 miles. Revenue and expenditure, 1938-39: revenue, £421,000; expenditure, £381,000. Education (elementary and secondary), 1937: elementary schools, 782; other schools, 59; total schools, 78,658.

Bechuanaland.—Principal products, 1938: gold, 19,111 oz.; silver, 1,127 ounces. Imports and exports, 1938: imports, £361,000; exports, £376,000. Roads, 2,048 mi.; railways, 396 miles. Revenue and expenditure, 1938-39: revenue, £190,000; expenditure, £203,000. Education (elementary and secondary), 1937: schools: European, 12; coloured, 2; native, 117.

Swaziland.—Principal products, 1938: gold, 1,246 oz.; tin, 174 tons. Exports, £116,000. Roads, 654 miles. Revenue and expenditure, 1938-39: revenue, £115,000; expenditure, £161,000. Education (elementary and secondary) 1937: European schools, 7; pupils, 354; pupils at native schools, 4,975; coloured: schools, 1; pupils, 38.

(J. L. K.)

British West Africa. Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given

British Possessions in Mediterranean

British Somaliland: see BRITISH EAST AFRICA.

British South Africa. Under this heading are grouped the British protectorates in the south of Africa. See BRITISH EMPIRE for population, capital towns, status and governors.

For other territories of the British Empire in the south of Africa see SOUTH AFRICA, THE UNION OF.

in the table on p. 117. See BRITISH EMPIRE for population, capital towns, status and governors.

History.—In the political sphere the four principal territories, viz., Nigeria, the Gold Coast, Sierra Leone, and the Gambia, have been brought closer together by a conference of governors which held its first meeting during 1939 and discussed a wide variety of subjects of common interest, economic and administrative. The conditions of world markets reacted unfavourably on revenue:

British West Africa

Territory & Area in sq. mi.	Principal Products exports 1938 (in tons)	Imports & Ex- ports 1938 (in thousand £)	Road, Rail & Shipping 1938	Revenue & Ex- penditure (in thousand £)	Education: Elementary & Secondary 1938

the prosperity of the West Coast depends largely on the cocoa trade. The Gold Coast cocoa crop is estimated at 250,000 tons and that of Nigeria at over 100,000 tons—these two territories, which in 1914 produced a negligible quantity, now supply the needs of Great Britain and account for more than half the world's supply.

The social services in the fields of health, education, and agriculture, show continued expansion. In Nigeria a scheme for the control of sleeping sickness is financed from the Colonial Development Fund and it is estimated that some 200,000 people will be protected by these measures from attacks by the disease. About 30 Africans are at present undergoing advanced medical training at Yaba college. Some labour unrest took place in Sierra Leone. The labour departments of Nigeria, the Gold Coast, and Sierra Leone have been strengthened and the Labour Adviser to the Colonial Office is touring West Africa to survey labour conditions. Legislation for the regulation of trades unions has been introduced in Nigeria and Sierra Leone.

In Nigeria local government is in the hands of the Africa authorities—Emirs, chiefs and their councils, who dispose of considerable revenues and finance social services. This system of local government, known as "indirect rule," is being extended with success in the Sierra Leone Protectorate where some 700,000 out of a population of 1,600,000 now live under this form of government. In the Gambia native administrations are also developing. In the Gold Coast the system of local government has been described as a mixture of direct and indirect rule, with a bias towards the latter. Except in the Northern Territories, the chiefs are unwilling to accept a system which implies a control of native treasuries, and there is no direct taxation from which these treasuries can be financed. The central government depends largely on a duty on cocoa exports.

(J. L. K.)

Broadcasting. During 1938 radio's most conspicuous achievement was its coverage of the two major international crises. But what was considered in 1938 unusual and exceptional in 1939 became daily and routine.

During the grim prologue to war, and after the declaration of war every movement on the diplomatic fronts, every important speech, every governmental declaration sounded in American radios. A succession of broadcasts from the chief European capitals brought kings, dictators, presidents, and prime ministers into 27,000,000 American homes. On the eventful first Sunday in September, the day England declared war on Germany, on one network alone 78 broadcasts were devoted to news, 20 from foreign countries. King George, Prime Minister Chamberlain, Premier Daladier, Prime Minister Mackenzie King and President

Roosevelt were among those who spoke on that day.

Americans heard the declaration of war hours before the news reached the German people. At 6 A.M., New York time, in a radio speech, Chamberlain declared war. A few moments later radio networks switched to Berlin. There it was learned that the German people and the news commentator himself were unaware that war had been declared and the broadcast told of German hopes for a last minute peace.

Today, actual warfare is broadcast. The U.S. heard the bombs that fell on Poland, the bitter

clash of Russian and Finnish troops from "somewhere in Finland." Through radio America has been able to follow every step in this world drama of war and peace.

The crises and war wrought a tremendous change in the whole structure of American broadcasting. The end of 1939 found American radio adjusted to broadcasting war. At one time commercial shows were ruthlessly interrupted and cancelled at frequent intervals for news reports. Now, there are daily pickups from foreign countries and special periods are set aside for talks by leading world figures. Radio has evolved order out of the chaos produced by crises and war.

Radio advertisers were the first to realize that America's dependence on radio for news made air time more valuable. Despite temporary losses during crisis periods radio has had the most successful financial year in its history. The three major networks showed an increase in profits of 13% over last year. Proof of listener interest was the fact that 9,000,000 new sets, particularly portables, went into United States homes during 1939, increasing the total number of sets in use throughout the country to 45,000,000.

Since radio's inception, broadcasters, the Government, and the public have recognized the need for certain regulation. The question always has been: who is to regulate? July 1939 the National Association of Broadcasters drew up its own code dealing with radio policies.

In a speech entitled "The Code Preserves Free Speech," Neville Miller, president of the N.A.B., said that: "There was a danger that due to the mere possession of money, various groups might monopolize, dominate or control the discussion of public issues over the radio, precluding a fair opportunity for the opposition, without financial resources to present its side of the case, and that such a situation would pervert the functions of American radio as a form of democracy, and would irreparably shatter the confidence of the public in the American system of broadcasting."

Representing the opposing viewpoint, David Lawrence, editor of the *United States News*, said, "The N.A.B. says that it will gladly give 'free time.' There we encounter the true censorship difficulty. Occasionally—but not regularly—and 'when facilities permit,' there will be 'free time.' The opportunity to have a regular week-by-week program on a controversial subject is, therefore, to be denied hereafter to any group or organization or citizen. You can buy time for a series of programs to sell toothpaste, but not to sell ideas."

The new code has evolved out of the N.A.B.'s conviction that unless radio regulates itself the Government will do so. Critics of the N.A.B. point out that the free speech provisions in the Con-

Upper left: "INFORMATION PLEASE" continued its popularity in 1939. Left to right: Oscar Levant, John Kieran, Moe Berg (a guest) and Franklin P. Adams, members of the "board of experts" which answers questions submitted by radio listeners and presented by Clifton Fadiman (upper right)

Above, left: HAROLD L. ICKES AND GEN. HUGH S. JOHNSON debated the subject "How Can We Defend Democracy?" Oct. 5, 1939, to begin the fifth year of the "Town Meeting of the Air" broadcast

Above, right: BROADCASTING THE BULLETIN early Sept. 3, 1939, in which Chamberlain announced a state of war between Great Britain and Germany

Below, left: "STUDIO NINE," designed especially by Columbia Broadcasting System to facilitate broadcasts of news bulletins, was completed just before the war began. Bob Trout, news reporter, and Elmer Davis, news analyst, are seated at the table

Below, right: SHORT-WAVE BROADCASTING by American stations to Europe and South America increased greatly in 1939 as a direct result of the European war

stitution are sufficient guarantee against any Governmental censorship.

The most conspicuous man in radio in 1939 was Elliott Roosevelt, son of President Roosevelt. For the last few years he has been working in radio. Until this year he confined his work to the management of several small stations owned by William Randolph Hearst. Last spring, the Emerson Radio Corporation sponsored Elliott Roosevelt as a news commentator on the Mutual Network. Special attention was focused on him because of his outspoken criticism of Father Coughlin. Last fall he left commenting to assume leadership of a proposed new network intended to take its place along with the National, Columbia, and Mutual Networks. Incidentally, Mr. Roosevelt has been one of the strongest critics of the N.A.B. code and resigned from the Association rather than accept its ruling prohibiting the sale of time for controversial issues. The end of the year finds the fourth network without sufficient financial backing to operate. Elliott Roosevelt has resigned leadership of it.

A full schedule of special event broadcasts was provided throughout 1939. These included a description of the funeral ceremonies of Pope Pius XI and the coronation of his successor, Pius XII, the sinking of the submarine, "Squalus," the visit to America of Britain's King and Queen, and the opening of World Fairs in New York and San Francisco. The most dramatic special broadcast came in the last days of December with an eye witness account of the scuttling of the German battleship "Graf Spee."

The most popular new program was "Information Please" heard each week over N.B.C. Ever since "Professor Quiz," question and answer programs have found favour with radio audiences. "Information Please" is a quiz program on a high intellectual level and as such has attained its present success.

One of the finest dramatic programs was the anti-Fascist verse play, "They Fly Through the Air." It was authored by Norman Corwin, a new writer who has revealed a keen and imaginative understanding of radio as a dramatic medium.

Highlights of this musical year were Arturo Toscanini in his regular broadcasts and John Barbiroli conducting the New York Philharmonic. At frequent intervals outstanding musical artists such as Ignace Paderewski, Marian Anderson, and Jascha Heifetz broadcasted. Encouragement was given native American composers by those arranging serious music broadcasts.

Regular television programs were inaugurated in March with the National Broadcasting Company telecasting the opening of the New York World's Fair. However, it seems the public is still a little wary of television, for less than 1,000 sets were sold throughout the United States in 1939. This year saw further technical improvements in television but not its emergence from the experimental stage. (See also RADIO, INDUSTRIAL ASPECTS OF; TELEVISION.) (R. KN.)

Great Britain.—While the B.B.C.'s change-over from a peace to a wartime basis was the overshadowing event of the year's broadcasting in Britain, the months of peace that preceded it showed steady development. During the year ending Nov. 30, 1939, the B.B.C.'s transmitters sent out 75,636 hours 50 minutes of broadcasting to listeners at home and 43,198 hours 38 minutes to Empire and overseas listeners. The opening of a new high power transmitter at Start Point, South Devon, and a medium transmitter at Clevedon, Somerset, brought improved reception to listeners in those regions. Work proceeded apace with the new extension to Broadcasting House, London.

As in other years, the corporation retained under contract many hundred musicians. The B.B.C. symphony concerts made their usual appearance during the winter season, and at the London Music Festival a Beethoven cycle of nine concerts was given by the B.B.C. Symphony orchestra; seven were conducted by Signor

Arturo Toscanini and two by Sir Adrian Boult.

Television continued to improve its position and when, owing to the war, the service closed down there were estimated to be 20,000 viewers, double the number of 1938. Plays, illustrated talks, ballet, variety and music were featured. People in their homes were enabled to view such happenings as the Boon-Danahar fight, the departure of the King and Queen for Canada, and the Derby. A television hour for young people was introduced.

Great events of 1939 closely followed by broadcasting were the State visit to England of the French President and Madam Lebrun and the Canadian tour of their Majesties King George VI and Queen Elizabeth. The King broadcasted on six occasions and the Queen broadcasted to women of the Empire on Armistice Day.

Throughout the year radio drama presented classic masterpieces of the theatre, and also a number of plays written specially for the microphone. The serial play took hold of the popular imagination.

Talks covered subjects practical, political and aesthetic, and contributed to the cause of adult education by the broadcasting for discussion groups of a number of series such as "The Pacific," "Australia Speaks," and "The Artist in the Witness Box." Local education authorities took increasing interest in this movement. Broadcast education made further strides, and in April 1939, 8,250 schools were registered as listening in England, Wales and Northern Ireland, and 1,262 in Scotland. On the outbreak of war these broadcasts proved valuable in assisting teachers with evacuated schoolchildren, and in bridging the gap between town and country children thrown together for the first time. Broadcast charitable appeals during the year realized an approximate figure of £224,220. This included the highest figure ever recorded, namely that obtained by Lord Baldwin's appeal for seamen and their dependents on December 17, which realized £74,000 in four weeks.

The coming of the war imposed serious limitations upon broadcasting, though it also opened up new opportunities. In the interests of national security and to avoid giving navigational aid to enemy aircraft, the traditional alternative program system was abandoned, and replaced by a single home service program. Starting at 7 A.M. and concluding at 12:15 A.M., this allowed for a longer broadcasting day than in peacetime.

Children's Hour, though reduced to a week-day period of 30 minutes, appeared for the first time as a regular Sunday afternoon program. The number of broadcast religious services was increased.

The B.B.C.'s overseas services were rapidly extended. To the well established Empire service were added daily broadcasts in Arabic, French, German, Italian, Spanish (for Spain and Spanish-America), and Portuguese (for Portugal and Brazil), and soon after the outbreak of war there were transmissions in Czech, Greek, Magyar, Polish, Rumanian, Serbo-Croat and Turkish. Broadcasts in Afrikaans were sent out to the Union of South Africa. Of particular wartime importance was the formation of the "monitoring" unit by means of which a 24-hour per day vigil was kept upon world broadcasting to the extent of some 250,000 words per day.

Although, upon the outbreak of war, the B.B.C., like the press, became subject to censorship requirements, the conditions of its charter and licence remained unchanged, and the corporation continued to function independently of Government control as a public service organization with its own board of governors. In order to facilitate the taking of quick decisions this board was reduced on the outbreak of war from seven to two. The year 1939 saw the retirement of R. C. Norman, for several years chairman, and the appointment in his place of Sir Allan Powell. (See also ADVERTISING.)

Bromine. The rapidly expanding demand for tetra-ethyl lead for treating motor gasolines has caused a marked increase in bromine production, since bromine is required in the preparation of the lead compound. The 1938 production of 33,500,000 lb. in the United States is estimated to have been about 80% of the world total. Little information is available on sources outside the United States, but Germany recovers bromine from salt and potash operations; France is apparently next in importance; the British plant for the treatment of Dead Sea brine has a considerable output; and Italy has a small output.

(G. A. Ro.)

Bronx-Whitestone Bridge: see BRIDGES.

Brookings Institution. The research program carried on at the Brookings Institution during the calendar year 1939 included studies of many important problems in the fields of economics and government. Among those completed were the following: "Reorganization of the National Government," by Lewis Meriam and Laurence F. Schmeckebier; a study of ways in which the Federal Government can be made more efficient and economical. "Government and Economic Life," by Leverett S. Lyon, Myron W. Watkins, and Victor Abramson; a broad analysis of the fundamental issues involved in the many and complex relations existing between Government and private enterprise. "Capital Expansion and Economic Stability," by Harold G. Moulton and others; a comprehensive investigation of the significance of, and problems involved in, the reopening of the capital markets. "Wages, Productivity, and the National Income," by Spurgeon Bell; a study of the significance of wages as part of the national income, and of the relationship of productivity to wages. "British Wages Boards," by Dorothy Sells; an inquiry into British experience in an endeavour to throw light upon wage and hour legislation and administration in the U.S.

In pursuance of the Institution's training program, 17 resident fellowships for work in the social sciences were granted to advanced graduate students for 1939-40. (H. G. Mo.)

Broun, Heywood (Campbell) (1888-1939), U. S. journalist and author, was born December 7 at Brooklyn, New York. After four years of study at Harvard he became a reporter for *The Morning Telegraph* in New York city. From 1912 to 1921 he was a sports writer and drama critic for *The New York Tribune*, and for seven years thereafter wrote a daily column for *The New York World*. This column, "It Seems to Me," a miscellany of personal opinions, became one of the most widely read in the United States. Broun was associated with the Scripps-Howard newspapers from 1928 until several days before his death, when he transferred his column to *The New York Post*. A vocal liberal, he helped found the American Newspaper Guild in 1933 and was its first president. Among his works are *Seeing Things at Night* (1921), *Pieces of Hate* (1922), *The Boy Grew Older* (1922), *The Sun Field* (1923), *Sitting on the World* (1924), and *Gandle Follows His Nose* (1926). Broun died December 18 in New York city.

Brubacher, Abram Royer (1870-1939), American educator, was born at Lebanon, Pa., July 27 and was educated at Phillips academy, Andover, Mass., and at Yale. After teaching Greek for two years at Yale he became principal of the high school at Gloversville, N.Y. (1902-05) and at Schenectady, N.Y. (1905-08). From 1908 to 1914 he was superintendent of schools in the latter city, and in 1914 he became president of New York State college, retaining this position until his death on August 23. He was the author of several volumes on English grammar.

Bruce, Charles Granville (1866-1939), British soldier and mountain climber, was born on April 7, the youngest son of the first Baron Aberdare. When he was 22 years old he joined the British Army in Burma and served with distinction there and in many parts of India. During the World War he fought in Egypt and at the Dardanelles, where he was wounded. He retired from the army in 1920 after being made brigadier-general. In 1922 he led the expedition which climbed Mt. Everest to the height of 27,300 feet. Two years later he organized another expedition to scale the peak but before it could get under way he was stricken with malaria and forced to retire. His party, however, continued the preparations and in 1924 set the world's record for altitude in mountain climbing—28,200 feet. Bruce was the author of *Twenty Years in the Himalayas* (1910), *Kulu and Lahoul* (1914), *The Assault on Mount Everest* (1922-23), and *Himalayan Wanderer* (1934). He died at London on July 12. For Bruce's account of the two ascents of Mt. Everest, see *Encyclopædia Britannica*, vol. 8, pp. 900-2.

Brunei: see BORNEO.

Bryn Mawr College, a women's college located at Bryn Mawr, Pa., has an enrolment of 635 and a faculty and teaching staff of 109 for its 1939-40 session. The undergraduate body numbers 495, the largest in its history, owing to the completion of a new dormitory. During the summer of 1939 work proceeded on the wing of the library which, when completed, will provide adequate space for the departments of art and archaeology. The Mrs. Otis Skinner Theatre Workshop and Art Studios, completed in the autumn of 1939, affords to students an opportunity for independent work in dramatic production and practical art. The new buildings provide facilities for an extensive academic program combining formal course work with independent and tutorial work as well as for dramatic experimentation and recreation. The Mary Paul Collins Scholarship for Foreign Women, awarded in the furtherance of a research project in the graduate school, was offered in 1939 in the Spanish department, the project a research problem on the materials, technique or expression of the Peninsular or Spanish-American drama during the 16th and 17th centuries. The plan for co-ordination in the teaching of the sciences is applied to all advanced work, integrating the work of the biology, physics, geology, chemistry, and mathematics departments and promoting study in the fruitful borderline research fields such as geophysics, biophysics, and biochemistry. (M. E. Pa.)

Buckwheat. The smallest buckwheat crop on record was reported in the United States in 1939. Preliminary estimates placed the yield at 5,767,000 bu. compared to 6,682,000 in 1938 and a 10-year average (1928-37) of 7,964,000 bushels. About two-thirds of the crop was grown in New York and Pennsylvania. Reduced acreage and hot weather during the blossom period caused the short crop.

Estimated Production of Buckwheat by States

	1938 bu.	1939 bu.		1938 bu.	1939 bu.
New York . . .	2,406,000	2,055,000	North Carolina . . .	52,000	60,000

(S. O. R.)

Budget. The Budget and Accounting Act of 1921 provided the United States with a national budget system and created a Bureau of the Budget to prepare for the President the Budget of the United States Government. The Act directs the President to submit to Congress on the first day of each regular session a budget which shall set forth in summary and in detail the expenditures and receipts of the Government for the fiscal year just completed, estimated expenditures and receipts for the current and for the ensuing fiscal years, and balanced statements showing the condition of the treasury at the end of each of these periods. Information regarding the indebtedness and financial condition of the Government and recommendations for new taxes and loans are also included in the budget document.

The executive departments and agencies are required to submit every year to the Bureau of the Budget by September 15 detailed estimates of their expenditures for the next fiscal year. The Bureau then conducts intensive hearings at which the departments and agencies defend and justify their estimated expenditures. The departmental estimates may be revised, reduced, or increased by the Bureau. The President, in conference with the director of the Bureau of the Budget, indicates points at which any changes should be made to conform with his general fiscal program.

1940 Appropriations for Governmental Departments and Agencies as shown in the 1941 Budget Statements adjusted to reflect transfers under authority of Reorganization Plans I and II.

Legislative Establishment	\$ 22,715,643.00
Executive Office and Independent Establishments:	
Executive Office	2,800,405.00
Civil Aeronautics Authority	25,768,000.00
Civil Service Commission	91,494,000.00
Employees Compensation Commission	10,268,400.00
General Accounting Office	10,531,540.00
Interstate Commerce Commission	8,948,000.00
National Labour Relations Board	3,189,600.00
Railroad Retirement Board	136,054,000.00
Securities and Exchange Commission	5,470,000.00
United States Maritime Commission	100,000,000.00
Veterans' Administration	557,078,000.00
Federal Security Agency:	
Civilian Conservation Corps	294,935,000.00
National Youth Administration	99,079,240.00
Social Security Board	369,039,790.00
Other	58,502,770.00
Total, Security Agency	822,476,300.00
Federal Works Agency:	
Works Projects Administration	1,476,921,000.00
Other	19,700,867.00
Total, Federal Works Agency	1,496,621,867.00
Other Independent Offices	19,966,320.00
Total, Executive Office and Independent Establishments.	3,790,576,432.00

Navy Department	720,789,461.00
Post Office Department, deficiency payable from general revenues	39,019,964.00
State Department	19,711,840.00
Treasury Department:	
Department proper	233,591,715.00
Old-age reserve account	580,000,000.00
Advances to Railroad Unemployment Insurance account	237,500,000.00
Payments to Federal Land Banks and Federal Farm Mortgage Corporation, reduction in interest	37,125,000.00
Restoration of capital impairment, Commodity Credit Corporation	110,599,918.05
Interest on the public debt	1,050,000,000.00
Public debt retirements	581,815,000.00
Total, Treasury Department	2,628,881,633.05
War Department:	
Military	660,167,878.00
Civil functions	47,684,960.00
Panama Canal	24,774,924.00
Total, War Department	732,627,762.00
District of Columbia (Federal Contribution)	6,000,000.00
Total, payable from general fund	9,681,233,539.81

The appropriation committees of Congress hold hearings on the estimates preparatory to consideration on the floor by both houses. Appropriation measures passed by Congress may be approved or vetoed in toto by the President. Supplemental or deficiency appropriations made necessary by new legislation or changed conditions, may be passed subsequent to the submission of the regular budget.

The various departments and agencies are then required to submit their plans of expenditures in schedules of monthly apportionments which the Bureau of the Budget may waive or modify. No expenditure in excess of the monthly apportionment may be made by any department or agency without the approval of the bureau.

The regrouping of agencies carried out under the Reorganization Act of 1939 transferred the Bureau of the Budget from the Treasury Department to the Executive Office of the President wherein are lodged the five agencies principally concerned with over-all management and central direction of the executive branch of the Federal Government. On Sept. 8, 1939, the President issued an Executive Order which specifically defined the functions and duties of the Bureau of the Budget. Besides assisting the President in the preparation and execution of the budget and the formulation of the fiscal program of the Government, the Bureau of the Budget conducts research in the development of improved plans of administrative management, develops reorganization proposals where they would be in the interest of economical and efficient administration, advises with the departments with respect to improved administrative organization and policy, clears and co-ordinates departmental advice on proposed legislation, assists in preparing proposed Executive Orders and Proclamations, co-ordinates Federal statistical services, and informs the President of the current and future work programs of the governmental agencies.

The Bureau of the Budget is thus charged with responsibility for assisting the President in the formulation of the United States Budget and the fiscal program of the Federal Government, and with advising him as to improved and economical administration of the executive branch of the Federal Government. (See also UNITED STATES: Budget.)

(H. D. SH.)

Great Britain.—The outbreak of war on September 3 involved a drastic revision of actual and prospective British national expenditure, and it at once became clear that the 1939-40 budget of April, 1939, would have to be reinforced by a war budget. This was duly opened at the end of September, and so 1939 resembled 1931 and also certain of the 1914-18 war years in being notable for two budgets.

The April budget was over-shadowed by heavy defence expenditure in preparation for the war which shortly was to break out. Largely for this reason ordinary expenditure for 1939-40 was estimated at £942 millions compared with actual expenditure of £927 millions in 1938-39. Revenue for 1939-40 on the old basis of taxation was estimated at £918 millions, and so additional taxation was imposed to bring revenue up to £942 millions. Even this left a gap of £372 millions to be covered by defence borrowing.

The chief new taxes then imposed were the raising of the motor vehicle duty from 15s. to 25s. per horse-power; the scaling up of surtax (see INCOME TAX) and estate duty rates; and increases of 2s. a lb. in the tobacco duty and 1d. a lb. (25%) in the sugar duty.

During the summer an armaments profits duty on excess profits earned on armament manufacture was imposed.

On the outbreak of war, the estimates of expenditure for 1939-40 were drastically revised from £1,453 millions (the amended estimate current when war began) to £1,933 millions. Conversely the revenue estimates had to be scaled downwards by £54 millions, partly because petrol rationing and the laying-up of cars would make the motor vehicle duty much less productive. To meet these needs, the government decided to impose tax in-

creases designed to raise the year's revenue to £995 millions; leaving £938 millions to be covered out of borrowing. Although this new taxation only brought in £107 millions, the increases in taxation were drastic. Further increases were made in income tax, surtax and estate duty rates, and also in duties on alcoholic liquors, tobacco and sugar. These equalled an extra 1d a pint on beer, 1s.3d. per bottle on whiskey, 1½d. an ounce on tobacco and 1d. a lb. on sugar. National defence contribution and armaments profits duty were merged in a new excess profits tax of 60 per cent on all profits earned in excess of a pre-war standard. (N. E. C.)

Building and Building Industry. The construction industry in the United States enjoyed during 1939 its best year since 1929. Improvement was especially marked in residential building. *The American Builder* claims an increase in the number of non-farm dwelling units built during 1939 of about 37% as compared with 1938. It estimates the total for the year at 475,000. Other responsible forecasters place it as high as 500,000.

About 74% of all dwelling units built in 1939 were single family houses, and more than 65% of the single family houses were in the price range under \$6,000. Total cost of all home building for the year is placed at about \$1,900,000,000. A substantial proportion of this building took place in suburban communities too small to figure among the more than 2,000 cities reporting to the U.S. Bureau of Labor Statistics. All sections of the country showed increases in residential building, with the largest gains in the Middle Atlantic, East North Central and South Atlantic States.

The Federal Housing Administration continued to be an important factor in the stimulation of residential construction through its insurance of mortgages. During the year 1939 it accepted for insurance loans to a total amount of \$1,035,000,000, of which \$645,000,000 represented new construction, \$210,000,000 repairs and modernization, and \$180,000,000 refinanced mortgages on existing homes. New dwelling units provided for numbered something over 150,000.

During 1939 there were Federal investigations of practices in restraint of trade tending to increase building costs. How much effect they will have in discouraging such increase may be shown during 1940, when the stage seems set for increased production,

Estimated Cost of Building Construction in Reporting Cities of 2,500 Population and Over, First 11 Months of 1938 and 1939

Type of Construction	First 11 Months of		Percentage change
	1939	1938	
Total construction . .	\$1,890,737,600	\$1,553,692,663	+21.7
New residential . . .	1,037,444, 771	777,572,148	+33.4
New non-residential .	541,608,612	486,521,671	+11.3
Additions, alterations, and repairs	311,594,217	289,598,844	+ 7.6

Number of Families Provided for in New Residential Construction in 257 Identical Cities, 1921 to 1939

Year	Families Provided for	Year	Families Provided for	Year	Families Provided for
1921	224,545	1928	388,678	1934	20,952
1922	377,395	1929	244,394	1935	55,490
1923	453,673	1930	125,315	1936	114,780
1924	442,096	1931	98,158	1937	117,323
1925	491,032	1932	27,380	1938	157,104
1926	462,208	1933	25,885	1939*	214,000
1927	406,095				

*Preliminary figure.

COSTS OF CONSTRUCTION (all types): Index of Associated General Contractors of America, Inc.

which is usually accompanied by rising costs. The question has been raised whether existing anti-trust laws would not render illegal in the United States an open agreement in the public interest *not* to increase prices, such as that of 1924 in Great Britain, which proved so beneficial to all concerned.

(E. E. Wo.)

Great Britain.—Building is an enormous industry spread all over the country in large and small units employing directly or indirectly some 2,500,000 persons.

During the early part of 1939 building activity was increasing rapidly and by the summer the industry was heavily engaged, largely as a result of Air Raid Precaution and defence work. In July direct employment in building and contracting had risen to 1,167,000 and it has been estimated by the Building Industries National Council that work on building was then proceeding at the rate of £400,000,000 per annum.

On the outbreak of war a large volume of Government work was in progress or contemplated on account of the expansion of productive effort and the need for increased storage. Doubtless with these considerations in mind the authorities made sweeping restrictions which have led to almost complete stoppage of new civil building work. The effect of such measures is shown by the fact that the number of operatives unemployed in October, was one third greater than in September in spite of the increase in

Government work and the depletion of the labour market due to the calling up of tradesmen for military service.

There is concern in the industry and associated interests at the results of these restrictions on civil building. The Government has naturally first claim on the resources of all industries for war purposes, but it seems essential to build up the national income by permitting as much civil activity as possible in order to increase the yield of taxation. The stimulating effect of a healthy building industry was amply demonstrated on its recovery following the depression.

If all sections of the industry had been brought into close contact with the responsible authority during the implementation of the rearmament program or at the outbreak of war, the resultant disruption might have been avoided.

The adequate organization of building programs, materials supply, classification of demands in order of urgency, elimination of inter-departmental competition, and the investigation of substitute materials, would make available a greater margin of resources for utilization in civil work spread fairly throughout the country. (See also HOUSING; UNITED STATES: *Housing*.)

Bulb Flowers: see HORTICULTURE.

Bulgaria. Area 39,814 sq.mi.; population (est. June 30, 1938) 6,360,500. Chief towns: Sofia (cap. incl. suburbs, April 1938; 335,000); Plovdiv (1937; 106,000); Varna (1934; 73,759); Rousse (1934; 49,447). Ruler, King Boris III; language, Bulgarian; religion, Christian, mainly Orthodox (Mohammedan 1934, 821,298).

History.—The early months of 1939 passed quietly in Bulgaria. Her relations with Turkey and Yugoslavia continued good, but ill-feeling against Rumania was kept alive by the shooting of 22 Bulgars in the Southern Dobruja (May 22). The Rumanian question, in particular, kept Bulgaria from joining the Balkan Entente. Relations with the U.S.S.R. also improved remarkably, and there were negotiations for increasing the trade between the two countries. On the outbreak of war, Bulgaria declared a policy of strict neutrality, but public opinion clearly felt the time approaching when Bulgaria's claims against Rumania in the Southern Dobruja could be pressed, and unlike her neighbours, she hailed with some enthusiasm the return of the U.S.S.R. to an active policy resembling that of pre-1914 Russia. It was Bulgaria's attitude which formed the chief obstacle to the formation of a neutral "Balkan Bloc."

On October 19 the Government resigned. A reconstruction on a more parliamentary basis was expected, there having been general complaints that the Government did not work with parliament; but when M. Kiussévanoff reconstituted his cabinet on October 23, only one member of it was drawn from parliament. It was stated that policy would be unchanged. Elections were announced for the end of the year. (N. Mac.)

Education.—In 1937-38: primary schools 7,263; scholars 955,292; total number of schools 8,013; scholars 1,098,986.

Banking and Finance.—Revenue, ordinary (actual 1938), 7,686,600,000 levs; (est. 1939), 7,057,100,000 levs; expenditure, ordinary (actual 1938) 7,207,000,000 levs; (est. 1939), 7,626,300,000 levs; public debt (Dec. 31, 1938) 21,778,880,000 levs; notes in circulation (monthly average 1938), 2,628,000,000 levs; gold reserve (Dec. 31, 1938), 2,006,000,000 levs; rate of exchange 360 levs=£1, sterling.

Trade and Communication.—Foreign trade 1938, merchandise: imports 4,934,193,000 levs; exports 5,578,341,000 levs. Communications (Jan. 1939): roads, national, suitable for motor traffic 11,866mi.; railways open to traffic 1,818mi.; motor vehicles li-

censed (Dec. 31, 1937): cars 3,020; commercial 1,091; cycles 1,352; wireless receiving set licences (1937) 31,658; telephone subscribers (1937) 24,000.

Agriculture and Manufactures.—Production in 1938: (in metric tons), wheat 2,149,674, (1939) 1,936,500; maize 518,332; barley 353,914, (1939) 333,800; rye 188,023, (1939) 245,700; potatoes 148,332; lignite 1,941,000; coal 145,000; oats 88,591, (1939) 127,900; tobacco 17,153; beet sugar 21,000; rice 19,100; wool 11,200; cotton, ginned 6,900; rape seed 20,600; hemp (fibre) 4,100. (W. H. WN.)

Bureau of Standards, National: see STANDARDS, NATIONAL BUREAU OF.

Burma. Area 261,610 sq.mi.; pop. (est. Dec. 31, 1936) 15,600,000. Chief towns: Rangoon (cap., 400,415), Mandalay (147,932), Moulmein (65,506). Governor: The Rt. Hon. Sir A. D. Cochrane; prime minister: The Hon. U. Pu; languages: Burmese and English; religion: Buddhist (84%).

History.—The year 1939 commenced with strikes at schools and colleges, in transport and industrial concerns. Settlement, however, soon followed. Dr. Ba Maw's ministry, defeated in the legislature, was succeeded by a new administration with U. Pu as premier. New institutions were—a State Polytechnic; a State Translation Bureau, to make available in Burmese latest scientific and arts treatises; a 10-kw. station at Rangoon broadcasting daily, news, talks, music and light entertainment.

An enlarged and reconstructed wharf was added to the amenities of Rangoon port.

The legislature passed in 1939 a Land Tenancy Act which deals with the problems of stable tenancies and a determination of fair rents in agriculture. The regulation of agricultural tenancies aims at establishing a progressive and self-supporting Burman peasantry.

A State Aid to Industries Act, designed to foster local enterprise by providing government help to new and nascent industries in Burma, received the Royal assent in November.

On October 10, the governor with the support of the ministry set up a Burma Defence Council to facilitate the development of the country's war effort.

Considerable trade expansion may be expected from the new Burma-China motor road, 770mi. long, from Lashio to Kunming in the province of Yunnan.

The road was completed early in 1939.

On Feb. 6, 1939 the King approved of a new national flag for Burma in recognition of its position as a unit of the Empire.

Education.—In 1938: total number of schools 26,073; scholars 778,682; primary schools 5,125; scholars 330,056; middle 1,005; scholars 131,883; high 365; scholars 85,611; special 1,142; scholars 18,257; unrecognized institutions 18,436; scholars 212,975; university, Rangoon, 2,121 students; arts college, Mandalay, 109 students.

Finance.—Revenue (est. 1939-40) Rs.15,43,23,000; expenditure (est. 1939-40) Rs.15,42,08,000; public debt (to India, to be funded in 43 years by an annuity of Rs.2,24,55,964) Rs.49,72,86,558; exchange rate Rupee (Rs.1)=1s.6d.

Trade and Communication.—Overseas trade (merchandise) 1938: imports Rs.20,77,79,000; exports Rs.47,80,96,000; re-exports Rs. 69,27,000. Communications 1939: roads, suitable for motor traffic, all-weather 6,263mi.; seasonal 6,280mi.; Railways, open to traffic 2,060mi.; inland waterways (approx.) 1,300 miles.

Agriculture, Manufactures, Mineral Production.—Production 1938-39 (in metric tons): rice 6,072,696; petroleum, crude (1938) 1,096,000; ground nuts 183,000; sesamum 53,000; maize 47,000; cotton, ginned 19,000; tobacco 45,000; silver (1938) 184.

Busch, Germán (1904-1939), Bolivian statesman and soldier, was born March 23 in the department of Santa Cruz. He attended military school at La Paz and was commissioned second lieutenant in 1922. As a captain of cavalry during the early part of the Gran Chaco war, he was cited several times for distinguished bravery under fire, and later he was advanced to commander of the cavalry and finally chief of the Bolivian general staff. When David Toro, the provisional president, resigned at the demand of the army July 13, 1937, Busch, who was then 33 years old and a national hero, assumed the provisional presidency. His administration at first had all the earmarks of being unusually liberal. He abolished censorship and promised early national elections, though he refused to rescind the order of his predecessor which had nationalized the petroleum concessions of the Standard Oil company of New Jersey in south-eastern Bolivia. In 1938 he brought the long controversy with Paraguay over the Chaco region to a peaceful conclusion. On April 24, 1939 he suddenly dismissed congress, suspended the constitution and all the courts, and took over dictatorial control of the country. Four months later, on August 23, he died in La Paz of a gun-shot wound which, according to the ministry of propaganda, was self-inflicted.

Business Cycles: see FINANCIAL REVIEW.

Butler, Pierce (1866-1939), American jurist, was born near St. Paul, Minn. on March 17 and received his bachelor's degree in 1887 from Carleton college, Northfield, Minnesota. He was admitted to the Minnesota bar in 1888 and practised law in St. Paul until 1923. President Harding nominated him associate justice of the U.S. Supreme Court Nov. 23, 1922; he was confirmed by the Senate the next month and took his seat Jan. 2, 1923. He was an outstanding conservative on the Supreme Court bench and although a Democrat voted consistently to annul legislation of the New Deal. Justice Butler died at Washington, D.C. on November 16.

Butter. As a direct result of increased industrial activity and an indirect result of war, prices for spot butter on the Chicago Mercantile exchange advanced from an inactive level of about 23½ cents a pound in August to 30¼ cents in the first 11 weeks of the war. The advance caused cessation of Government operations to peg butter around 24 cents by means of loans to the co-operatives' Dairy Products Marketing Association. United States foreign trade in butter has always been negligible. Even the greatly expanded exports of 1918 were only about 2% of production. The British Food Ministry on September 25 announced a maximum price of 27.3 cents a pound that importers might charge wholesalers in the United Kingdom for butter. Later it was announced that a butter ration of 4oz. per person per week would subsequently be put into effect. This is the same butter ration that had been in effect in Germany some months. Butter stocks in the United Kingdom at the outbreak of war were 65,579,000lb., approximately a three-weeks' supply and compared to 74,125,000lb. a year earlier. Nevertheless, United Kingdom imports from the Continent were further reduced. The United Kingdom imported 634,518,000lb. the first seven months of 1939; and 663,073,000lb. for the like period in 1938.

Stocks of creamery butter in the United States October 1, the peak of the storage season, were 155,000,000lb. in 1939, and 211,000,000lb. in 1938, a record in storage accumulations owing to DPMA storing 115,000,000lb. by means of a Government loan of about \$32,000,000. The DPMA attempted to fix prices at around

30 cents in 1938, but failed, and the accumulation was transferred to the Federal Surplus Commodity Corporation to distribute through relief channels. On July 26, 1939, the Government authorized a \$6,000,000 loan to the DPMA, to buy up to 25,000,000 pounds. Between July 29 and September 9, the DPMA accumulated 12,117,705 pounds.

On November 1 the DPMA and the FSCC had 21,228,000lb. in storage. Production of creamery butter in the United States from January 1 to September 30 was 1,406,388,000lb. in 1939 and 1,410,537,000lb. in 1938.

In Canada stocks of creamery butter November 1 were 56,203,773lb. in 1939 and 62,829,604lb. in 1938. Production in Canada from Jan. to Oct. 1939, was 239,399,939lb., a decrease of 0.7% from the same period in 1938.

War and Peacetime Butter Exports of the United States

Average Yearly	Lb.	Average Yearly	Lb.
1910-14	4,277,000	1918	26,103,000
1915	17,043,000	1919	34,556,000
1916	26,561,000	1934-38	1,153,000
1917	7,193,000		

(S. O. R.)

Cabinet Members. The following members of President Roosevelt's cabinet held office on Jan. 1, 1940:

Post	Name	State
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Harry H. Woodring	Kansas
Attorney-General	Frank Murphy*	Michigan
Postmaster General	James A. Farley	New York
Secretary of the Navy	Charles Edison**	New Jersey
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Henry A. Wallace	Iowa
Secretary of Commerce	Harry L. Hopkins	Iowa
Secretary of Labor	Frances Perkins	New York

*Succeeded by Robert H. Jackson of New York, who was nominated Jan. 4, 1940.

**Sworn in Jan. 2, 1940.

Great Britain.—The following changes were made in the British Cabinet during 1939, up to the outbreak of war in September:—

On January 28 Sir Thomas Inskip became Dominions Secretary, being succeeded on September 3 by Mr. Anthony Eden, who had special access to the War Cabinet. Lord Chatfield, Minister for Co-ordination of Defence; Sir Reginald Dorman-Smith, Minister of Agriculture and Fisheries; and Mr. W. S. Morrison, Chancellor of the Duchy of Lancaster. On April 20 Mr. Leslie Burgin was created Minister of Supply, and was succeeded as Minister of Transport on April 21 by Capt. Euan Wallace.

Immediately upon the declaration of war against Germany on September 3, a War Cabinet was constituted as follows:—

Prime Minister and First Lord of the Treasury, Mr. Neville Chamberlain;
 Chancellor of the Exchequer, Sir John Simon;
 Secretary of State for Foreign Affairs, Viscount Halifax;
 Minister for the Co-ordination of Defence, Admiral of the Fleet Lord Chatfield;
 First Lord of the Admiralty, Mr. Winston S. Churchill;
 Secretary of State for War, Mr. L. Hore-Belisha*;
 Secretary of State for Air, Sir Kingsley Wood;
 Lord Privy Seal, Sir Samuel Hoare;
 Minister without Portfolio, Lord Hankey.

*Resigned Jan. 5, 1940; succeeded by Mr. Oliver Stanley.

Cabot, Richard Clarke (1868-1939), American physician and author, was born in Brookline, Mass., on May 21 and was educated at Noble's school and at Harvard university, where he received his M.D. degree in 1892. In 1894 he established his medical practice in Boston, where he lived the rest of his life. In 1899 he joined the staff of the Harvard Medical school, where he was professor of clinical medicine from 1919 until 1933. Dr. Cabot was a lifelong student of philosophy and social ethics. In 1903 and 1904 he lectured before Prof. Josiah Royce's seminar in logic, and he was professor of social ethics at Harvard from 1920 to 1934. He early brought

his interest in social problems to bear upon the question of socialized medicine, and he was one of the first in the United States to argue the practicability of group medical service. Frequently censured, he in his turn criticized the medical profession as reactionary and expensive for the ordinary patient. From 1912 to 1921 he was chief of staff of the Massachusetts General hospital, where he established a procedure for treatment of needy patients that was later adopted by hospitals all over the nation. Besides several volumes on diagnosis and medical case teaching, he was the author of *What Men Live By* (1914), *Adventures on the Borderlands of Ethics* (1926) and *The Meaning of Right and Wrong* (1933). He died at Boston on May 8.

Calendar of Events, 1939: see pages 1-18.

California, Pacific coast State of the United States, and thirty-first State to enter the Union (Sept. 9, 1850), is popularly known as "The Golden State"; area, 155,652 sq.mi., population (U.S. census, 1930) 5,677,251, California Taxpayers Association estimate, Jan. 1, 1940, 7,100,000. Capital, Sacramento, 93,750. Cities larger than Sacramento (1930) were: Los Angeles, 1,238,048; San Francisco, 634,394; Oakland, 248,063; San Diego, 147,995; Long Beach, 142,032.

Of the State's population, 4,160,596 were urban, or 73.3%; 5,040,247 whites; 97,456 Japanese; 81,048 Negro; 37,361 Chinese; 4,603,287 native born; 1,073,964 foreign born.

History.—Culbert L. Olson, California's first Democratic governor in 44 years, was inaugurated Jan. 2, 1939. Five days later he suffered a collapse, brought on by the strain of a hectic campaign and inaugural ceremonies, and for some weeks was unable actively to prosecute the duties of his office. Upon his recovery, Governor Olson faced a hostile legislature, which, throughout a record-breaking session of 133 days, consistently balked his liberal program. The Republican Senate and an Assembly with a scant Democratic majority slashed some \$91,000,000 from the Olson budget, including a \$71,000,000 relief item, for which was later substituted a \$35,525,000 temporary appropriation, to last until early 1940. The revised budget, totalling \$468,071,624 for the 1939-41 biennium, was still the largest in State history. Despite the mounting treasury deficit and the unbalanced budget, the legislature rejected the governor's entire new taxation program, except for a tax on gifts. Also repudiated was a pet Olson project involving a grant of \$170,000,000 to municipalities for distribution of electric power to be generated at Shasta dam. During the latter part of the session, State police were employed to round up missing representatives and barricade the halls against utility lobbyists. With the defeat of his recommendations by the 1939 legislature, Governor Olson called a special session for Jan. 29, 1940. The political scene was further enlivened by the special election of November 7. A revised "Thirty Dollars Every Thursday" pension scheme, again on the ballot after its 5-to-4 defeat in 1938, was this time repudiated 2-to-1, after a hot campaign. A measure for petroleum conservation, passed by the legislature and endorsed by the United States Navy, the C.I.O., and Democratic and Republican leaders, also was defeated, with a large negative vote in the oil-producing south serving to overcome the affirmative majority in the north. Two measures limiting interest on small loans were the only ones approved. As regards municipal elections, Los Angeles voters carried on the purge of city politics begun by reform Mayor Fletcher Bowron in 1938, and, in San Francisco, conservative Mayor Angelo J. Rossi retained his office by a scant margin over liberal Congressman Franck R. Havenner.

Although the 1938 probe of lobbying in the State legislature

failed to bring the repercussions anticipated, the Los Angeles reform movement continued, and, in March, Joseph Shaw, brother and secretary of former mayor Frank L. Shaw, was convicted, along with Civil Service Commissioner William Cormack, on 63 counts of selling civil service jobs. Graft allegations brought the indictment of William G. Bonelli, member of the State Board of Equalization, while formal charges were filed against the State Prison board for alleged mass floggings at San Quentin prison.

Labour troubles were most pronounced in the maritime industry, and especially in San Francisco, where, in November, earlier sporadic disturbances culminated in a general longshoremen's strike, which ended after 53 days with an agreement to negotiate differences. Crux of the difficulties on San Francisco's waterfront (according to the city's business leaders) was Pacific Coast Longshoremen leader Harry Bridges; in the summer he was the central figure in a nine-weeks' hearing on Angel island, in which the Government, enthusiastically supported by employer and other conservative interests, vainly sought his deportation as a Communist and undesirable alien. Another development with labour implications was the pardon, early in January, of Thomas J. Mooney, who had served 22 years for the San Francisco Preparedness Day bombing of 1916; Warren K. Billings, Mooney co-defendant, was released later in the year.

Government construction projects made rapid headway. On November 5, ground was broken for the \$14,000,000 Friant dam, on the upper San Joaquin river, while the pouring of concrete for Shasta dam was expected to begin early in 1940. Friant dam, the second major unit of the \$170,000,000 Central valley project, will be the fifth largest masonry dam in the world. Interurban railway service across the San Francisco bay bridge began in Jan. 1939, and the \$50,000,000 Golden Gate International Exposition, open 254 days, drew 10,496,203 visitors. The fair, although it closed with a \$4,600,000 deficit, was to re-open for four months in 1940.

Education.—In education, California maintained its high position. The University of California continued to be rated with Harvard and Columbia as one of the country's leading universities. With a physical plant valued at over \$50,000,000, assets exceeding \$70,000,000, and an operating budget of \$12,938,736 for 1939-40 (63.1% received from the State), the university led the nation in full-time enrolment (26,004 in the fall semester 1939). The well-developed public school system, buttressing the university, was allotted nearly \$77,000,000 by the State for 1939-41.

Charities.—Despite large Federal contributions and the new unemployment reserves benefits, State direct relief expenditures rapidly mounted, and in late 1939 were running at about \$4,000,000 monthly, with additional county expenditures of approximately \$6,000,000. Largely responsible for the increase was the influx of migratory workers, of whom 332,526 entered the State between Jan. 1, 1936 and Sept. 30, 1939. During 1938-39 the expenditure for unemployment relief, exclusive of unemployment reserves benefits and county relief, was \$119,802,769 (\$42,047,590 State, \$77,755,179 Federal). The case load on June 30, 1939 (again omitting counties) was 174,930 (about 24% Mexican), representing some 575,000 individuals (approximately 8% of the State's population). In November, there were 134,010 aged, 6,796 blind, and 39,125 children receiving categorical aids. Relief innovations during the year were the adoption in San Francisco of the Federal food-stamp plan, whereby surplus commodities are sold at reduced prices, and the inauguration in Los Angeles of the first unit of Governor Olson's "production-for-use" relief program.

Finance and Banking.—State Government costs for the fiscal year ending June 30, 1939 reached a record high of \$279,284,297, 7.6% greater than the 1938, and more than double the 1933 figure. Primary factors in this increase were the State's assumption of additional educational burdens and the skyrocketing of relief needs.

The cumulative general fund deficit as of June 30 was \$76,328,554, including a \$44,746,926 carry-over from previous *biennia*. Unless revenues increased, the State finance department predicted a deficit of over \$100,000,000 by June 30, 1941. Bank debits from 15 cities regularly submitting Federal Reserve reports were \$25,558,925,000, as compared with \$24,904,593,000 in 1938. On Oct. 2, 1939, there were 228 banks (128 State, 100 national), with a capital stock of \$202,722,000, capital funds of \$429,453,000, deposits of \$4,215,023,000, and total resources of \$4,702,828,000. The year's most sensational development in California banking occurred when the State took over management of the \$50,000,000 Pacific States Saving and Loan Company, whose president, Robert S. Odell, was indicted on charges of conspiracy and mail fraud.

Agriculture, Manufactures.—Business activity showed a marked advance in Nov.-Dec. 1939, spurred by the European war and the repudiation of the "Ham and Eggs" pension bill at the polls. The production value in basic industries for the year as a whole, however, remained approximately the same as in 1938, when the figure was \$1,930,000,000 (16% less than 1937); manufacturing accounted for about 44% (value added), agriculture 29%, mining 16%, motion pictures 8% (cost of production), lumbering 2%, and fisheries 1%. Gross farm income (including Federal payments, which increased 75% in 1939) approximated the 1938 figure of \$540,000,000. Manufacturing was sharply accelerated in the latter half of the year, showing at least a 7% increase in monthly average employment and aggregate payroll. Production values in mining advanced moderately, except for petroleum, which declined 11%, largely because of the voluntary curtailment of output by producers. Imports were \$117,129,000 for the first 11 months (compared with \$96,640,951 in 1938); exports aggregated \$253,216,671 (compared with \$259,807,439 in 1938).

(C. E. CH.; R. H. SH.)

California, University of. The most important event of the year at the University of California was the granting of an increased budget by the State Legislature for the biennium 1939-41. This budget, while below the minimum asked for, amounted to \$8,165,540, and has relieved some of the financial difficulties of the institution. This State budget represents 63.1% of the total budget of the university. Further relief from the problems of a steadily increasing student registration, which mounted to 27,511 in the year closing June 30, 1939, was afforded by PWA grants from the Federal Government for the first wing of a Life Sciences building on the Los Angeles campus of the university, and for a new library and administration building on the Davis campus. PWA funds were also secured to help in the construction of a new home for the University of California Press at Berkeley. These buildings will all be occupied by the spring of 1940.

Various major administrative and curricular changes have been consummated during the year 1939, including the splitting of the Teachers college into a School of Education and a College of Applied Arts, and the addition of three new fields of study for the Doctor of Philosophy degree on the Los Angeles campus; the establishing of a separate department of social welfare, and a department of journalism on the Berkeley campus; and the concentrating of various technical courses in nutrition, etc., into a division of home economics, functioning both at Berkeley and on the Davis campus. The experiment of offering a general course on family relations was also started on the Berkeley campus in the fall of 1939. The College of Pharmacy at the Medical Center in San Francisco completed its first year under the new plan of requiring four years of college work for a degree, and of offering graduate instruction for those desiring it. A number of laboratories were completed, including the radiation laboratory at

Berkeley, a poultry disease laboratory at Davis, a bubonic plague laboratory at the Medical Center, etc.

Gifts to the seven campuses of the university for the year ending June 30, 1939, totalled \$1,881,872.62. A greater number of distinguished scholars were added to the faculty than in any year of the past decade.

(R. G. S.)

Calinescu, Armand (1893-1939), Rumanian statesman. Son of a Rumanian army officer and landholder, he was born May 22 at Pitesti, and was educated at the University of Bucharest, where he received his law degree, and at Paris, where he received a doctorate in political science. He established a legal practice in his native town and shortly entered politics as a prefect of his county and as an organizer for the National Peasant party, which had been established in 1926. A close student of agricultural economics, he was appointed secretary general of the ministry of agriculture and later was under secretary of interior. In Dec. 1937, Calinescu became minister of interior in the cabinet of Octavian Goga, and he retained this portfolio in Miron Cristea's cabinet in Feb. 1938, when King Carol demanded Goga's resignation. When Cristea's health failed, Calinescu was appointed vice-premier, and upon Cristea's death he became premier March 7, 1939. He was a bitter enemy of the pro-Nazi "All for Fatherland" party (Iron Guard) and waged a relentless war on its members. He was assassinated September 21 by Iron Guardists while driving through the streets of Bucharest. His successor as premier, Gen. George Argesanu, exacted a speedy revenge for the crime and executed not only the actual assassins and their co-plotters, but several hundred other Iron Guard leaders and sympathizers as well.

Cambodia: see FRENCH COLONIAL EMPIRE.

Cambridge University. During 1938-39 the number of matriculants was 1,936, the largest ever recorded except in 1919. The masterships of Christs and Clare fell vacant by retirement, and of Peterhouse by death. The chairs of ancient philosophy, political science, philosophy, and archaeology fell vacant and the last named has been filled by Miss D. A. E. Garrod, the first woman professor in the university.

Generous benefactions have been received by the Library, Fitzwilliam museum, an additional amount to the chair of naval history, and further endowments for scientific research.

The University Press has published the last volume of *Ancient History*, thus completing the various series dealing with the history of the Western world, suggested by Lord Acton.

A voluntary register of the qualifications and experience of its senior members was compiled by the university, so that on the outbreak of war the services of scientific and other specialists could be immediately used. Also a University Recruiting Board has been set up to select members for such war service for which each is equipped. The following colleges and departments of London university have been evacuated to different Cambridge colleges:—Bedford college, Queen Mary's college, St. Bartholomew's Medical school, London Hospital Medical school, London School of Economics, Bartlett School of Architecture and the School of Oriental and African Studies.

Camp Fire Girls. Formulated in 1911 by Dr. and Mrs. Luther Gulick and a group of other educators as a program of leisure time activities for girls, the Camp Fire Girls organization was incorporated in 1912.

The revised program of the Camp Fire Girls, made in 1936 in

order to provide for a wider age range and to include current interests of the modern girl, continues to win and hold the interest of 'teen age girls.

There continues to be an increase in Blue Bird membership (the junior organization for girls eight and nine years old) both girls and leaders seeming to appreciate the program of creative play activities revised in 1938.

As a special project for 1939 the Camp Fire Girls explored Americana. They found out about the historical backgrounds of their communities, interviewing pioneers, visiting historical sites and collecting relics for exhibits.

There was a Camp Fire Girls' Day at each of the World's Fairs. At the New York World's Fair the girls challenged the Boy Scouts to a pancake baking contest—which they won. At the Golden Gate Exposition over 5,000 Camp Fire Girls gathered from nearby cities for an all day program.

There was an increase in all types of camping enjoyed by Camp Fire Girls: the summer sessions at the large organized camps, the camping trips of individual groups and the holiday and week-end camping throughout the year.

At 11 camps national training courses were well attended by group leaders, and in addition leaders received training in courses given by local Camp Fire executives in 145 cities.

The Honourable Franklin D. Roosevelt is honorary president of the organization, and Mrs. Roosevelt is honorary chairman of the advisory committee. The following national officers were re-elected at the meeting of the National Council, held in Berkeley, Calif., in Oct. 1939: Mrs. Elbert Williams, president; Edgar Webb, treasurer; Lester F. Scott, secretary and national executive. Her Highness Princess Marie Louise is patroness of the British Camp Fire Girls, and Lady (Walter) Hearn is president.

(C. F. Lo.)

Canada. Canada, a self-governing British dominion of North America; capital, Ottawa; governor general, Lord Tweedsmuir; prime minister, W. L. Mackenzie King; area, 3,729,665 sq.mi.; pop. (census of 1931) 10,376,786, estimated (Jan. 1, 1940) 11,367,000.

History.—The Dominion continued under the administration of the Liberal Party with Mr. Mackenzie King as prime minister, elected to power Oct. 14, 1935. Unless sooner dissolved, parliament expires in five years and consequently general elections will be held in 1940. The term of the governor general also expires in the current year. The press has already spoken freely of Lord Elgin, grandson of a former governor general of Canada as his probable successor.

Among the important official and diplomatic changes of the Federal Government, may be mentioned the retirement of the Hon. Philippe Roy, Canadian minister to France, succeeded by Col. George P. Venier. On September 15 Loring C. Christie was appointed Canadian minister to Washington. Jean Desy, the first Canadian minister to Belgium and Holland, was received by King Leopold of Belgium (February 4). L. W. Brockington, retiring from the chairmanship of the Canadian Broadcasting Corporation (December 21), was appointed Canadian official War Recorder.

Inside the ministry itself Norman A. McLarty of Windsor, Ont. succeeded John C. Elliott as Post Master General (January 23). An important reorganization of the cabinet, as indicated below, was made after the outbreak of war. Among the parliamentary references and reports, great prominence attached to that of Justice H. N. Davis on the Bren Gun contract, tabled in the House of Commons. In the Canadian provinces, general elections were held in Prince Edward Island (May 18) where the Liberal administration under Thane Campbell was overwhelmingly returned to office (27 seats to 3 Conservative). Elections were held in Quebec (Oc-

tober 21) in which the National Union Government of Mr. Duplessis, advocating extreme provincial autonomy, was utterly defeated, the Liberal Party obtaining 68 of the 86 seats in the Legislative Assembly. An administration of that party was formed under Adelard Godbout. On November 20, elections in New Brunswick returned to office the Liberal administration of A. A. Dymally, with 28 seats in the legislature Liberal and 20 Conservative.

Tour of the King and Queen.—A unique and striking feature of the history of the year was the visit to Canada of their Majesties King George VI and Queen Elizabeth, the first visit ever made to America by any reigning British sovereign. Their tour covered the breadth of the Dominion from the Atlantic to the Pacific. The visit, made directly by arrangement with His Majesty's ministers in Canada, inaugurated, both constitutionally and in the popular mind, the now accepted status of Canada as one of the equal associates in the British Commonwealth. Landing from the "Empress of Australia" at Quebec on May 17 their Majesties were received by the Prime Minister of Canada (the Rt. Hon. William Lyon Mackenzie King) and tendered a reception in the name of the Province of Quebec by the Legislative Assembly, with an official luncheon at the Chateau Frontenac. At Montreal their Majesties occupied a royal suite specially prepared at the Windsor hotel, where a civic banquet was offered in their honour (May 18). At Ottawa they were the guests of the governor general at Rideau Hall and received a welcome from the two Houses of Parliament. During the entire tour the entertainment of the King and Queen was official only, but the cheering crowds which everywhere thronged to greet them, and the gracious moments of unofficial intercourse given by the King and Queen, made the tour partake of the appearance of a vast personal welcome. At Toronto the Dionne quintuplets were presented to their Majesties and the Queen, as honorary Colonel, gave colours to the Toronto Highland regiment. Proceeding west from Toronto their Majesties stopped at Port Arthur and Fort William, Winnipeg, and Regina where they inspected the headquarters of the Royal Canadian Mounted Police. After seeing Moose Jaw and Calgary and spending a day in the mountains at Banff, the royal sovereigns, reached Vancouver (May 29) and Victoria (May 30). The return journey was made via Edmonton, Saskatoon, and Sudbury where the King and Queen made a descent into a nickel mine. Reaching Niagara on June 7 their Majesties entered the United States for a brief tour. (See ROOSEVELT, FRANKLIN DELANO; UNITED STATES.)

Returning to Canada (June 12) they passed via the eastern townships of Quebec to Fredericton, N.B. Leaving New Brunswick on the Canadian destroyer "Skena" they crossed to Charlottetown, P.E.I., and thence to Halifax. Leaving Halifax on the "Empress of Britain" their Majesties touched at Newfoundland and reached Southampton on June 22.

Outbreak of War.—(See EUROPEAN WAR.) In Canada there was no doubt from the first that the Dominion would participate in

EMPLOYMENT IN CANADA: index as of first of month, adjusted for seasonal variation. Compiled by Dominion Bureau of Statistics from reports from representative establishments, including construction and maintenance, manufacturing, mining, service, trade, and transportation

¹Died Feb. 11, 1940.

any war involving Britain. The ministry took no direct part in negotiations with Germany but expressed, at the height of the crisis, their entire acquiescence in the British attitude. War began for Britain on September 3, for Canada it did not legally begin till September 10. When the King's declaration of war was proclaimed the Dominion Executive Government at once expressed its adherence to British policy but could not declare war without a summons of parliament, not then in session. The war session began on September 7. The overwhelming vote in approval of the Speech from the Throne (September 9) warranted a declaration of war which was issued as a royal proclamation by the governor general in the following terms: "Now therefore we do hereby declare and proclaim that a state of war with the German Reich exists and has existed in our Dominion of Canada as from the tenth day of September 1939."

Even before the parliament met, the Government had adopted special war measures by reviving under Order in Council the War Measures Act of 1914 which clothes the Executive Government with dictatorial power to do anything immediately necessitated by the state of war. During the ensuing war session, a series of Acts of Parliament supplemented these emergency powers. A War-Time Prices and Trade Board was set-up, composed of three persons appointed during the pleasure of the Crown with power to investigate prices, costs, and stocks of goods; to assign maximum prices and to punish hoarding and monopoly. The Act carries penalties of \$5,000 or two years in jail or both. Special war taxes were enacted by amendment of the Customs, Excise and Income Tax Acts, and a special excess profits tax. A further act established a department of munitions and supply. The Cabinet was reorganized by a shift of portfolios on September 19. Norman M. Rogers left the Labour department to become minister of National Defence, Norman McLarty moving to Labour from the Post Office which was taken over by C. G. Power. The Hon. Ian Macenzie, formerly minister of National Defence, became minister of Pensions, and Colonel J. L. Ralston succeeded C. A. Dunning whose condition of health necessitated his relinquishing the portfolio of Finance.

The opening of the war closed down a veil of official secrecy on all movements of troops and of all arrivals and departures of ships at the Canadian seaports. Parliament authorized (September 19) a Canadian active service force to be initiated with two divisions, and placed at the head of it Brigadier General Andrew McNaughton (*q.v.*). A first division was to proceed overseas by contingents. No public announcement was made of its personnel or of the time of its departure. It was understood that the major part of the force had reached England at the end of the year. Meantime the Permanent Militia (standing army of Canada) was recruited to full strength and expanded by new enlistment, with an obligation to go overseas as required.

Economic Life of Canada.—The economic life of the Dominion of Canada was so profoundly affected by the outbreak of war with Germany in the beginning of September that the first eight months of the year 1939 must be entirely differentiated from the period that follows. Any economic statistics computed for the year as an annual total or as a monthly average over 12 months, necessarily contains a misleading element. It is also necessary to remember that much information of what has happened since September 3 is officially withheld, and that a large part of the financial life of the country has passed under the restriction of exchange control.

Of the first eight months of the year it may be said that the period represents in general the further continuance of the constant, if arduous, emergence from the great depression of the opening decade. The estimates for field crops, volume and value, as analyzed by the Hon. James C. Gardiner, minister of Agricul-

ture, Ottawa, show that Canadian agriculture was in a better position at the close of the year 1939 than it has been for several years. The gross value of field crops is placed at \$635,764,000. more than \$91,000,000 over the figures of 1938 and constituting the record since 1930. Wheat especially shows an advance, with a crop of 478,965,000bu., second only to the banner crop of 566,726,000bu. in 1928.

The livestock industry has also showed a forward movement. The estimates made by the Department of Agriculture (Ottawa) indicate that the cessation of the great drought and the heavy crops of 1938 had brought an increasing supply of livestock, as calculated in the summer of 1939 for autumn and winter slaughter. Stock thus due for market showed in 1939, 2,209,000 hogs as against 1,779,000 in 1938, and 1,496,000 cattle as against 1,362,000. The closing of the vast war contracts for meat supplies will carry this movement forward into 1940.

In regard to the manufacturing industries of Canada of 1939, it may be said that the total industrial production of Canada in the first half of 1939 showed a certain, but not great recession. In the steel industry this decline represented as much as 14% below 1938, but was counterbalanced by the rapid expansion that followed the opening of the war. The month of December showed a wide margin of advance over the two previous years. The automotive industry may be said to have held its own. Motor vehicles purchased in September (6,755, value \$7,626,227) were in advance of the preceding year (5,710). The great advance in the aircraft industry is discussed in the section *War Finance and Industry*. In textiles, the cotton industry opened to what seemed a lean year. Mills were on short time for the opening months. Two large companies, Canadian Cottons and Dominion Textiles, closed their fiscal years on March 31 with earnings short of common dividend requirements. After June the situation improved. The United States was restricting production, Lancashire, owing to a brisk home demand, exporting less. War conditions (transport and the U.S. premium) gave a new stimulus to Canadian mills. In general terms it may be said that manufacture in Canada (Jan. 1-Sept. 1, 1939) was at best holding its own, but the war has greatly speeded up the steel, paper, and metal industries and aided most others. (S. LEA.)

War Finance and Industry.—In Canadian financial circles the outbreak of the war in September was taken calmly. There was no closing of stock exchanges, no public hysteria, no wholesale liquidation of securities, and no strain on the banks or other financial institutions. This quiet confidence continued to manifest itself throughout the year.

Canada, as other nations, had already abandoned the gold standard so there was no need to take this step, but to protect the external value of the dollar an Exchange Control Board was set up. By order of this board no more than \$100 may be taken or sent out of Canada by any person in any one month without a spe-

PHYSICAL VOLUME OF BUSINESS in Canada: combined index of industrial production and distribution. Compiled by Dominion Bureau of Statistics

cial licence. The purpose of this is to retain capital in Canada and to prevent speculation in foreign exchange, but the order is in no way intended to restrict international trade.

At the special session of Parliament (September 7-13) to meet the extraordinary expenditures necessarily arising when a country is at war, a supplementary budget was introduced to secure additional revenue. The ordinary budget of April 1939 had anticipated a revenue of \$490,000,000 and an expenditure of \$550,000,000, involving thus a deficit of some \$60,000,000. This was for the fiscal year (March 31, 1939-April 1, 1940), exclusive of certain defence expenditures, capitalized under a special sinking fund plan, and of any losses arising out of the guarantee of 70¢ a bushel for wheat.

When the war budget was introduced it was estimated by the Acting Minister of Finance, J. L. Ilsley, that there would be an increase of \$5,000,000 over the April figure in ordinary revenue for the year, owing to the placing of substantial war orders (*see below*). Against this there was the new authorized expenditure of \$100,000,000 for war purposes. Including this amount, the expenditures for the year were expected to reach \$651,000,000 as compared with a revenue of \$495,000,000, leaving a deficit of \$156,000,000. To meet this deficit the Federal Parliament voted new taxes and increases in certain existing taxes.

Among the new taxes is the excess profits tax on all businesses whether incorporated or not. This provides for a tax on one of two bases (the choice lies with the taxpayer), either on the basis of a graduated scale of rates of profit on capital employed or on the increase in profits over the average of the past four years. Where the tax is levied on the rates of profit on capital employed, it ranges from a minimum of 10% on profits in excess of 5% and not exceeding 10% on such capital. Where the tax is levied on profits in excess of the average annual profits for the past four years it is 50% of such excess profits. This tax is in addition to all other taxes.

The ordinary corporation income tax is increased by 3%, thus providing for additional revenue in any case. All individuals subject to income tax are required to pay a surtax equal to 20% of their ordinary income tax. In the field of indirect taxation, the excise tax on liquors and brandy, imported or domestic, has been increased by \$3 per gallon, on wines 7½¢, and on cigarettes \$1 a thousand. Beer and non-alcoholic drinks are taxed through increased levies on the raw materials of manufacture. The customs tariff on tea and coffee has been increased.

It is difficult to estimate at this time how much these additional taxes will yield, and hence how close they will come to meeting current expenditure. In the meantime (Oct. 12, 1939) the Government floated a war loan for \$200,000,000. This was fully subscribed at par by the chartered banks of Canada. A domestic loan, similar to those of 1914-18, is planned for 1940.

Industry under War.—The effect of the war on Canadian industry has not been as great as was anticipated. Estimates of the volume of munition equipment orders from the Government of the United Kingdom, and the rapidity with which they would be placed, were not fulfilled, largely because existing overseas supplies were adequate for the type of warfare that was being fought, and, for diplomatic reasons, some orders were placed with neutral European countries. However, the repeated assurances that the Government of the United Kingdom will buy extensively from Canadian manufacturers appears at the end of this year (1939) to hold. In October the Government of the United Kingdom contracted for a year with seven of the mining companies of Canada for 80% of their current output of electrolytic copper, which amounts to about 420,000,000 pounds. The agreement is subject to renewal for the duration of the war. In the following month (November) all Canadian exports of lead and zinc were placed

KING GEORGE and Queen Elizabeth enthroned in the Canadian Parliament at Ottawa May 19, 1939

under exclusive contract, for the use of Great Britain for the duration of the war. Exports of lead and zinc in 1938 amounted to \$30,000,000, but war requirements will call for greater supplies. In December these two orders were supplemented by a contract for a weekly supply of 4,480,000lb. of Canadian bacon and up to 5,600,000, if deliveries can be made, at \$20.18 per English cwt. at the Canadian seaboard. A Federal Bacon Marketing Board has been set up to control the price of bacon in the domestic market.

Industry has also been aided by orders for war materials from the Government of Canada. Up to the end of the year the Canadian War Supply Board had let contracts totalling \$54,000,000. For 1940 increased industrial activity is assured through the operation of the Commonwealth air training plan. The final agreement was signed in Dec. 1939. The agreement makes provision for the training of many thousands of aeroplane pilots, requiring a staff of 40,000 men for the 67 training schools which are to be established. A large amount of work will be necessary in constructing the 60 new air fields, and in improving existing fields, as well as in making equipment. The agreement runs for 3½ years, to be extended if necessary, and the estimated cost for this period is \$600,000,000, with Canada contributing as her share \$350,000,000. The estimated expenditure on the plan up to Sept. 1, 1940 is \$90,000,000, of which Canada will contribute \$48,000,000. This is in addition to the estimate of the minister of Finance of \$315,000,000 for the first year's cost of the military program. Canada in 1940 will be spending \$1,000,000 a day on war effort.

The steel industry was affected immediately by the outbreak of war, which precipitated buying in anticipation of a possible shortage or of a price increase. After losing ground in the first half of the year, when production declined 14%, increased activity in the second six months resulted in an output for the full year of approximately 1,375,000 long tons, a marked gain over 1938 and almost equalling the post war record year of 1937.

In civil aviation there was marked progress during 1939. The Trans-Canada Air Lines service, inaugurated in 1937, has developed rapidly. The mail service between Vancouver and Winnipeg was extended to Toronto, Ottawa, and Montreal on an overnight basis at the beginning of March 1939, and on April 1 passenger service was begun between these points. On July 18, 1939, an additional service was established between Montreal, Ottawa, and Toronto. With the further extension of mail and express service to Moncton on November 1, the Air Lines became Trans-Canada in fact as well as in name. The Trans-Canada Air Lines fleet now consists of 15 Super Electras which make the Vancouver-Montreal trip in 15hr. including stops and the Montreal-Moncton lap in 2½hr., the whole route covering nearly 3,500 miles. The potential value of the T.C.A. services was emphasized by the inauguration, in August, of Imperial Airways transatlantic mail service, when British mail was received in Vancouver only 54hr. after leaving Southampton. The experimental flights of the transatlantic service were discontinued for the winter season. The Trans-Canada Air Lines from its beginning up to Sept. 1, 1939 has flown 3,853,243 revenue miles, carried 13,583 passengers, 645,400lb. of mail, and 33,103lb. of express.

Railway statistics reflect the increased industrial activity during the latter part of the year. Canadian railways earned \$42,960,066 in September compared with \$34,504,187 a year ago. This was an increase of \$8,455,879 or 24.5%. Operating expenses increased by only \$2,651,568 and the operating income increased by \$5,674,076 or from \$6,374,816 in 1938 to \$12,048,892. For January-September gross revenues increased from \$237,533,359 in 1938 to \$253,709,429; operating expenses increased from \$222,468,159 to \$225,301,554, and the operating income from \$4,229,146 to \$17,146,147.

The latest statements of the chartered banks as at the end of October, showed commercial loans at their highest for seven years. They were placed at \$952,296,000, a gain of \$60,800,000 as compared with September, and of \$104,000,000 as compared with Oct. 1938. Bank debits to individual accounts in November were \$2,930,000,000 as compared with \$2,955,000,000, in Nov. 1938.

Overshadowing war expenditures as an impetus to business generally was the increased purchasing power of the farming community. The Dominion Bureau of Statistics estimates the value of the principal field crops for 1939 at \$635,764,000 an increase of \$91,321,000 over 1938.

It is too soon to judge how the repeal of the Neutrality Act of the United States will affect the war industries of Canada.

(J. T. C.)

Public Finance.—At the opening of the year the main estimates (given January 25) for the fiscal year April 1, 1939-40, totalled \$457,291,215, including \$63,435,176 for national defence. But as early as March 25 C. A. Dunning, the minister of Finance, forecast a budget deficit of \$60,000,000. For the first eight months, the pre-war period of 1939, the Federal revenue was \$354,713,180 as compared with \$358,408,250, in the preceding year. Expenditures amounted to \$374,449,127 as compared with \$335,496,039. The outbreak of war necessitated a reorganization of taxation and finance. (See section *War Finance and Industry*.)

Mineral Production.—The first nine months of 1939 showed a strong advance in mineral production in Canada. Dr. Charles Camsell, deputy minister of mines (Ottawa) stated in a communi-

"NO WALLS OF STEEL IN AMERICA." The visit of King George VI to North America in May and June 1939 inspired this cartoon by Selbel of *The Richmond Times-Dispatch*

cation to a leading Canadian journal that in all probability the year will show a new record in the value of gold and petroleum production and that the total value of mineral production will probably surpass the figure of \$441,823,237 reached in 1938. Gold produced in the first nine months of the year amounted to 3,803,202 fine ounces (3,464,308 in 1938); nickel, in pounds, 170,361,711 (160,097,162 in 1938). The production of asbestos was well ahead of that of 1938 but fell short of the record output of 410,000 tons in 1937.

Power Development.—Still more striking is the advance in the development of water power. The year 1939 showed great activity in the installation of new capacity and in the extension of transmission and distributing facilities. Each month in succession for the period ending October 31 showed an increase in the production of electrical energy over the year before, and the 10-month period averaged a 9% increase. Of the 97,040 h.p. increase of new installations the greater part (87,441) is made up of extensions in Saskatchewan, Ontario, and Quebec, largely due to the development of the mineral and paper industries.

External Trade.—In the pre-war period of 1939 Canadian external trade had shown a decided increase. Even with lower wholesale prices the exports of Canada were valued at \$823,905,000 in 11 months of 1939. Imports of merchandise showed \$595,000,000 as against \$569,000,000.

Labour and Employment.—Wages during the pre-war months of 1939 remained on the whole stationary, nor were there any wide or violent labour disputes during the year. The situation in regard to unemployment and public relief showed a certain betterment. The official Canadian index of industrial employment is based on returns from 11,856 firms (1939) employing 1,165,631 persons. The comparison made is with 1926 and shows an in-

crease from 100 to 119 for Sept. 1939 as compared with 115 a year before. On the other hand the same month in 1937 showed a figure of 123. These statistics, however, are of limited range, not including agriculture and other primary industries. The figures in regard to public relief make a better showing. Persons on direct unemployment relief throughout Canada totalled 541,500 in September, a decrease of 32% compared with the previous month and a decrease of 2.2% compared with the same period of 1938. A very real improvement showed in the matter of relief to farmers, the recipients numbering, with their dependents, 71,000, or a decrease of 34% from the year before.

Prices.—Prices in 1939, both as tabulated in the retail prices of weekly family budgets throughout Canada (*Labour Gazette of Canada*—monthly), and in the wholesale prices of general commodities (*Ibid.*), were moving very little in the first eight months of the year. The Canadian official calculation is made with 1926 as the basis of 100. The index at the outbreak of the war stood at 72.8 as compared with the high point; in retrospect, 164.3 for May 1920 and the low point 63.5 for Feb. 1933. (S. LEA.)

Canadian Literature. In contrast to 1938 when the field of "general literature" provided the better fare, 1939 was more noted for fiction. The psychological novel, now becoming less rare in Canada, dominates, and shows a salutary, though still mild awareness of the author's responsibility as an interpreter. Frederick Philip Grove, a veteran writer, suggests a new approach to problems of human relationships in *Two Generations*, a penetrating study of Ontario farm life during a period of social and economic dislocation. Miss Irene Baird's *Waste Heritage*, a bitter indictment of current labour injustices, is a *volte-face* from her pleasantly innocuous and popular earlier novel, *John*, but does not increase her reputation. The costume, refuge of mediocrity in recent years, gains fresh lustre in *The Champlain Road*, a tale of the Jesuit Missions in Huronia, by Franklin D. McDowell.

General literature provided less achievement. One notable book in that field is Mrs. L. G. Salverson's *Confessions of an Immigrant's Daughter*. Readable personal histories are a negligible factor in Canadian literature; but Mrs. Salverson, who won the governor-general's award for fiction in 1937, writes with a verve inherited from Viking ancestors, and increases the scanty store of good Canadian autobiography. The poetry of 1939 tends to progressiveness without recourse to too experimental metres. Supplemented by a pleasing freshness of interpretation, this trend is reflected in Miss Anne Marriott's *The Wind Our Enemy*, Alan Creighton's *Cross-Country*, and Arthur S. Bourinot's *Under the Sun*. All belong to the younger poetic generation.

The brightly edited *Canadian Bookman* has suspended publication, at least temporarily, but the *Canadian Poetry Magazine*, backed by the Canadian Authors' Association, survives and shines under the editorship of E. J. Pratt. The governor-general's awards for the best Canadian books published in 1938 went to Miss Gwethalyn Graham's *Swiss Sonata* (fiction), Kenneth Leslie's *By Stubbish Stars* (poetry), and John Murray Gibbon's *Canadian Mosaic* (general literature). (R. S. K.)

Canadian Medical Association. The Canadian Medical Association was organized in the city of Quebec on Oct. 10, 1867, and held its first meeting in Montreal on Sept. 2, 1868. Annual meetings have been held each year since, with the exception of 1915 and 1916. In 1921 the society underwent reorganization, and in 1925 was affiliated with the British Medical Association. A monthly journal, *The Canadian Medical Association Journal*, has been published since 1911. All the provincial medical societies are affiliated with

the association, and any licensed practitioner who is a member of a provincial society is eligible for membership. The present membership is over 4,000. (J. T. C.)

Canals and Inland Waterways. The principal inland navigable waters of the United States are the Great Lakes, the New York State canal system, the Mississippi river system, the Atlantic Intracoastal waterway, the Intracoastal waterway from St. Marks river in Florida to Corpus Christi, Tex., the San Joaquin-Sacramento system in California, and the Columbia system in the northwest. The Great Lakes have natural deep water except in the connecting channels, which have been artificially deepened where necessary to accommodate a draft of 24ft.; and the Welland Ship canal joining Lakes Erie and Ontario, as improved by Canada, has a permissible draft of 23.5 feet. The 12-ft. New York State Barge canal is being deepened to 14ft. between the Hudson river and Lake Ontario at Oswego. The Atlantic Intracoastal waterway system between Trenton, N.J., and Wilmington, N.C., has been completed to project depths of not less than 12ft., and thence to Key Largo, Fla., 63mi. below Miami, with depths of from seven to ten feet. Deepening of the waterway to 12ft. between Wilmington, N.C., and St. Johns river, Fla., was in progress at the close of 1939. Dredging in Cape Cod canal to secure a channel width of not less than 500ft. and a depth of 32ft. at mean low water is actively in progress. The Chesapeake and Delaware canal has been dredged to 27 feet. On the Gulf coast, projects have been adopted to provide a protected Intracoastal Waterway not less than 9ft. in depth between St. Marks river, Fla., and Corpus Christi, Tex., more than 1,000mi., and this depth is available from Apalachicola to Galveston. Dredging of the waterway south of Galveston is in progress. The Mississippi has a 9-ft. depth from Baton Rouge to St. Louis, and work is well advanced to secure a 9-ft. channel thence to Minneapolis by the construction of a series of 26 locks and dams, the last of which, lock and dam No. 24 at Clarksville, Mo., will be completed by the 1940 navigation season.

Traffic on Major Canals and Inland Waterways of the U. S. for 1938

	Tons	Value
St. Clair Flats Canal	54,228,643	\$ 606,447,830

Chesapeake and Delaware Canal	2,234,110	149,739,480
New Orleans Navigation Canal	1,866,997	211,288,916

The total traffic of United States canals and waterways in 1938 was computed after eliminating all known duplications of traffic at 277,754,587 short tons, valued at \$5,657,886,608. (For statistics regarding the Panama canal see PANAMA CANAL AND CANAL ZONE. See also AQUEDUCTS.) (J. L. S.)

Great Britain.—Activities during 1939 in Great Britain in connection with the improvement of facilities for inland navigation have been practically confined to the carrying out by the recently established Catchment Boards of a series of regulation and improvement works on certain rivers within their respective jurisdictions. Notable among these, as in the previous year, has been the river Nene, in which important developments have taken place on various sections of the river from Wisbech to Northampton. Although still incomplete, sea-going vessels now make regular journeys as far as Peterborough and in the upper reaches there is a regular service of barges from the Midlands and London to points near Northampton and Wellingborough. Works have been in progress on other rivers, but more with the object of flood

TWO RIVERS, one natural and one artificial, intersect near Calexico, Calif., where the All-American canal bridges a stream

prevention than of facilitating navigation.

Belgium.—An outstanding event of the year on the continent of Europe was the practical completion in Belgium of the Albert canal, connecting the industrial town of Liège with the seaport of Antwerp. About 80 miles in length and with a capacity for barges of 2,000 tons, it was on the verge of an official opening in July, in association with the great Water Exhibition at Liège, when the unfortunate failure of a portion of the banks caused a temporary delay which has extended into the war period. The canal is intended to make Liège the distributing centre not only for Belgium, but also for the Grand Duchy of Luxembourg and parts of northern France.

France.—An important project, known as the "Canal des Deux Mers" designed to connect the Gironde estuary in the west with the Mediterranean near the town of Narbonne was revived for consideration in the early part of the year. A ship canal of the same calibre as the Panama and Suez canals, it would involve an outlay so considerable, that there is little probability of active measures being taken for some time after the restoration of peace conditions.

Germany.—The completion of the Mittel-land canal in 1938 gave Germany a great inland waterway system extending from the North sea to Berlin and beyond. Having completed this program in the north, the attention of the Reich has been mainly directed to another great project, known as the Rhine-Main-Danube system, which, scheduled for completion in 1945, will form an arterial waterway through the heart of Europe reaching as far as the Black sea. Before the outbreak of the European war, the work was being strenuously pushed forward, notwithstanding an admitted "lack of working power," due to shortage of men and scarcity of certain structural materials. In February, an announcement was made that Herr Hitler had approved a scheme for enlarging the Kiel canal to approximately double its present capacity. More recently, the Adolf Hitler canal in western

Germany, connecting the river Oder with the town of Gleiwitz in Upper Silesia has been opened to traffic, thus making Gleiwitz an inland port.

Russia.—An enterprising policy of inland waterway development is being prosecuted in Russia, including what is known as the Volga-Don scheme, which in regard to its ultimate goal is one of the most far-reaching. The White, Baltic, and Caspian seas are already linked up with the Volga; the new canal, for which initiatory steps have been taken, will connect the same river with the Black sea and the Sea of Azov thus linking up five seas on the northern and southern frontiers of the country. A plan has been outlined for converting Leningrad into a great river port. Another large canal, 270km. in length, has been commenced in the cotton district of Fergana in Russian Central Asia. (B. Cu.)

Cancer. *Chemistry of Tumours.*—Two well known German chemists, Kögl and Erxleben, recently published investigations on the structure of the amino acids which made up the molecules of the tumour proteins. They isolated these amino acids by standard methods and compared their optical rotatory power with that of the amino acids obtained from proteins of normal adult and embryonic tissues. The component amino acids which make up the proteins are quite numerous and some exceedingly difficult to isolate in pure form. The most convenient to study in this connection is glutamic acid, which forms a considerable percentage of the protein molecule, is fairly easy to isolate in pure form, and is not altered in its rotatory power during the course of purification. In their preliminary experiments the authors used some human and animal tumours, and some normal rabbit tissues. In the tumours they found from 15 to 44.5% of the glutamic acid was in a form which does not ordi-

narly occur. This the authors designate as the "unnatural" form. By determining the rotatory power of the isolated acid it is possible to estimate the proportion between that form which normally occurs in healthy tissues and the infrequent or "unnatural" form. The proportions varied considerably in the different tumours which were studied.

In a further paper Kögl confirms the original discovery in a new series of amino acid analyses, the normal adult and embryonic tissues containing only the pure l-form of glutamic acid. Again, a great variability was found in the amount of these "unnatural" or d-form of glutamic acid, varying from 44.5% in the Brown-Pearce rabbit tumour to as low as 2% in human uterine myoma. In tumours with a high glutamic acid content of the "unnatural" form, at least one-tenth of the total tumour protein may contain these altered acids.

The work has been confirmed on a small scale by Arnow and Opsahl, who found approximately 41% of d-glutamic acid in one adenocarcinoma of the intestine, and 26% in another. What is still more interesting, they were able to find some of the unusual acid in the tissue of the intestine near one of the growths. Other workers have not been able to confirm Kögl's findings and there the question rests.

The obvious question which now presents itself is, what, if any, relationship exists between this steric alteration in structure in some of the amino acids in tumours and the causation of cancer? Of course, as yet no proof has been given that these changes have anything to do with the causation of the disease. No evidence has been offered that the d-glutamic acid may not be present in the tissue in conditions other than cancer. Over 15 years ago Warburg made the statement that the causation of cancer lay in the peculiar method by which the cancer cells oxidized glucose. But shortly thereafter it was found that certain normal cells could do the same thing, and there has never been any conclusive evidence brought forward that there is any causal relationship between lactic acid sugar destruction and tumour growth. The differences in amino acids are more suggestive, for it is known that there may be certain differences in the pharmacologic action between dextrorotary and levorotary forms of the same substance. And, also, it is undoubted that the protein structure of the cell is more likely to carry with it important physiological differences than is probable with the sugars. It must be remembered that the cancer cell possesses a certain type of immortality, as is shown by the grafted tumours in animals, for some of these have been transplanted thousands of times and still retain all of the biological and morphological characteristics observed in the first spontaneous tumour from which they were derived.

One weak point in Kögl's argument lies in the fact that he includes uterine myomata as tumours. These growths are not true tumours, but are merely hyperplasias of the fibromuscular structure of the uterus under the influence of the female sex hormone. If the ovaries of the female are damaged by X-ray or removed by surgery, the fibromyoma disappears. In other words, the tumour has no independent and permanent existence, and in a recent paper Kögl reports finding very little of the "unnatural" glutamic acid in such growths.

As it is now generally agreed that the cancer cell is a somatic mutation form of the normal cell, the theory is attractive that such a cell is one which can only form its protein molecule by splitting the racemic amino acids in the food and using the d-form, and that once this has occurred, the capacity may remain to give a permanent characteristic to the cell. However, there is another phase of the question, and that is the astonishing capacity of some tumour cells to produce their characteristic secretions apparently fully as well as the cells in the healthy organ, showing that the malignant change has not greatly altered the cell's normal capaci-

ties. This is seen in liver tumours where the cancer cells produce bile, and in tumours of the thyroid where the specific thyroid secretion is formed in abundance by the cells of the thyroid tumour, and by the curious effects on the body which tumours of the adrenal gland exert, and by the fact that tumours of the islands of Langerhans in the pancreas can synthesize insulin.

Whether or not this interesting chemical discovery will ultimately prove to have a causal relationship with the qualities of the cancer cell and thereby open some new routes of attack which may result in destruction of the neoplastic cell, a great field of interesting experimental work has been opened by this fertile study which may occupy the energies of chemists for many years, just as Warburg's incorrect assumption has led to many important discoveries concerning the sugar metabolism of various types of tissues.

Refrigeration Treatment of Cancer.—For more than 20 years it has been known that the effect of chilling tumour cells in the body or of heating them by diathermy or of treating them with X-rays or radium produced similar morphological alterations in the cytoplasm of the cells and the nuclear structures. These changes consisted in rendering the cell membrane more permeable, hence the cells became swollen. In the nuclear substance, especially in those cells which are in the course of division, are produced the well known types of malformation, such as giant cells, cells with highly distorted mitotic figures, in all tissues studied, so that it is impossible from a microscopic section alone to distinguish between those cells which have been heated, chilled, or rayed with X-ray or radium. Unquestionably these monstrous cells are not viable, and hence do not continue to propagate in the growing tumour. The walls of the terminal arterioles may be greatly thickened if the use of these physical agents is continued for some time.

Studies of cutaneous body temperature have shown great variations in readings, the skin of the hands and feet being from 12 to 22°F below the normal for the mouth. Again, it is well known that neoplasms affect the bones and soft tissues of the extremities less frequently than other portions of the body. These observations led Temple Fay to investigate the effects of lowering the temperature in the substance of the carcinomatous growth. Five weeks of continuous local refrigeration of a tumour in a human patient was accompanied by improvement in appetite, gain in weight, freedom from pain, and shrinkage of the tumour mass. She remained comfortable for four-and-a-half months, after which there was a return of the pain. As a result of this favourable effect, other patients were exposed, using only those who were advanced and hopeless, and especially those who had tumours which had been shown to be incurable by radiation. They were treated by local refrigeration alone or with artificial reduction of the entire body temperature, by which a condition is produced resembling hibernation in animals. To produce hibernation the body temperature, as read by gastric and rectal thermocouples, was maintained at levels between 81 and 90°F. Local cooling is accomplished by ice water or brine circulating through an apparatus made to fit the structure in which the lesion exists.

Results have been observed which are of great interest. In every instance there has been a prompt reduction in pain and sometimes complete relief. This is of importance because many of the patients treated had been receiving 5 to 6 grains of morphine a day and were being considered for a last resort cordotomy, an extremely difficult and dangerous operation. By the use of refrigeration it was possible to avoid surgical intervention and to eliminate the use of drugs in almost all instances. Furthermore, there was a measurable decrease in the size of the neoplasm, coupled with a general improvement in the patients' condition, gain in weight, better appetite, and an improved mental state. As far

A NEW TEST FOR DETECTING THE PRESENCE OF EARLY CANCER, by crystallizing blood in a solution of copper chloride, was described in Sept. 1939 by Dr. Ehrenfried Pfeiffer of Hahnemann Medical college, Philadelphia. At the left is the crystallized blood mixture of a healthy person; at the right, that of a patient with cancer

as can be observed, there has been a diminution in the growth rate of recurrences. The lack of growth seems to be largely due to a reduction in the blood supply, the continuous cooling causing a contraction of the blood vessels. Such diminution in blood supply obviously points to one of the dangers of this therapy where hibernation is used, and that is heart failure from diminished nutrition in those who have vascular lesions of the heart muscle. This has been responsible for the death of several patients. So far the writers stress the absence of pain as the chief beneficial factor. The method is now being studied in several other hospitals and its risks and value in the treatment of hopeless cancer should be determined in a short time. To date no claim is made by the authors that permanent cures may be obtained. (See also ALIMENTARY SYSTEM, DISORDERS OF; EYE, DISEASES OF; MEDICINE: *Basic Research*; RADIOLOGY; X-RAY.)

Candid Camera: see PHOTOGRAPHY, MINIATURE CAMERA.

Candy. Confectionery, largely a penny business, is the sixth most important division of the food industry in the United States. It is a penny business because the bulk of confectionery, including chocolate, is sold in penny units. Often referred to as a depression-proof industry, profits in candy making and selling have steadily decreased since 1921, considered the peak year. The decline has been due primarily to faulty and loose price structure.

According to the Department of Commerce, there are in the United States some 1,200 manufacturers of candy employing over 50,000 people, producing about 2,000,000,000lb. of candy annually, with a wholesale volume of just under \$300,000,000 and a retail volume of almost \$600,000,000. But only 38 firms do an annual business of \$1,000,000 or over, 65 firms are responsible for almost 60% of the output and about 200 firms do over 80% of the industry's tonnage. Candy is sold through some 500,000 outlets, from the corner candy store to even the shoe shine parlour. Chicago is the production centre. Boston, New York, and Philadelphia follow in importance. Preliminary report for 1939

indicates a sales increase of 3% to 4% over 1938. Because of advance in raw material prices, induced by European war conditions, candy prices were somewhat higher in 1939 than in 1938. But prices were not advanced to fully cover increases in prices of raw materials. The average value per pound of candy in 1939 was a little over 15¢ compared with about 14¢ in 1938. Per capita consumption in United States is 16lb., which means that the average American consumer buys about \$2.40 worth of candy annually.

No country in the world has commercialized candy as has the United States. Great Britain comes second—but not a very close second. Its annual retail output is about \$260,000,000. For a number of years Switzerland, Germany, and France led Europe in chocolate production. The picture has changed because of the war. Very little candy is now being produced in Europe. Chocolate is about the only item that is being made and that is used principally for consumption by soldiers. Because of war conditions very little candy is now being imported in the United States. Whereas Great Britain was responsible for the bulk of imported candy in the United States, today practically all the imported candy comes from Holland and Estonia.

The most important developments in 1939 in candy business was the increase in the demand for and sale of fancy packages. Because the new Food and Drug Act goes into effect in its entirety on July 1, 1940, candy manufacturers will be required to list all ingredients on the labels. (H. D. G.)

Cane Sugar: see SUGAR.

Canning Industry. U.S. canned food production in 1939 totalled about 312,503,000 cases, compared with 326,899,000 cases in 1938, and 234,146,000 cases ten years earlier. Production of canned food during the last ten years has increased much faster than the population. On a per capita basis, production has increased about 45% during the last ten years, and at the same time, prices of canned foods have declined.

Fruits and vegetables are the canned food items packed in largest quantity, which amounted to about 235,000,000 cases in 1939. The next largest item was canned milk, of which 50,000,000 cases were packed. The 1939 fish and meat pack totalled about 28,000,000 cases. The canning industry during 1939 used over 10,000,000,000 tin containers, gave employment to about 350,000 persons, and utilized a portion of the crops grown by 350,000 farmers.

Of especial interest to the industry were developments concern-

ing labelling of canned foods under the Food, Drug, and Cosmetic Act of 1938. The labelling provisions of this Act were to have become effective in June 1939, but were postponed by the Lea Act until Jan. 1, 1940, and, under conditions set forth in a regulation under the Lea Act, until July 1, 1940.

Hearings on standards for various vegetables and fruits began in January and continued through April. Products under consideration included tomatoes and tomato products, apricots, peaches, pears, cherries, and a list of about 40 vegetables. Final standards for tomatoes and tomato products, and peaches, were issued in 1939, and the others were expected early in 1940. Final standards for these products, and others yet to be considered, will dictate the labelling requirements for the respective products, and their provisions have the basic purpose of providing the consumer with descriptive information.

The program of economic research sponsored by the industry, but under the active guidance of economists not directly connected with the industry was, in 1939, directed in its first phase toward investigation of financing methods. There was further technological research devoted to improvement of quality of canned foods. Increased information on the processing of non-acid products was obtained, which was used in the preparation of a processing bulletin (No. 26-L, Fourth Ed.) published by the National Canners Association.

There was a notable trend in the direction of standardization of can sizes. Resulting from a collaborative consideration of the problem by the National Bureau of Standards and the industry, recommendations were made as to containers for fruits and vegetables. It is expected that the coming packs will show substantial acceptance of the recommendations that have been made.

Cape Verde Islands: see PORTUGUESE COLONIAL EMPIRE.

Capital Punishment. In the United States, New York at the end of 1937 took the first step toward joining the large majority of States which allow the jury to grant mercy in capital cases. The New York State Penal Code now allows the jury to grant mercy in felony murder cases (homicide in the commission of a felony: burglary or robbery).

Five States now retain absolute capital punishment: Vermont, Connecticut, Massachusetts, New Mexico, and North Carolina. Seven States have abolished the death penalty: Maine, Rhode Island, Michigan, North and South Dakota, Minnesota, and Wisconsin.

South Dakota (1939) restored the death penalty, but failed to make an appropriation for setting up an electric chair, in spite of the fact that the governor, following a sensational crime, had approved the capital punishment bill. The matter must come before the 1941 Legislature. The South Dakota measure, like the old Kansas law, forbade execution until a year after sentence.

Kansas, for 28 years without statute capital punishment, restored the death penalty in 1935. Though 11 States still hang criminals, the majority, 21 States, put them to death by electrocution. Eight States have substituted lethal gas. All of the States with lethal gas chambers are in the west except North Carolina and Missouri. One State, Utah, gives the condemned the choice of hanging or shooting. The former has never been elected.

On Nov. 16, 1938, the British House of Commons passed, by a vote of 114 to 89, a Resolution by Vyvyan Adams, M.P. favouring abolition of the death penalty experimentally for a period of five years. While the Government took a neutral position, it declared that any experimental change in the law should extend beyond the five year period.

In Central and South America the following countries have ended capital punishment, now sentencing instead to long but limited prison terms: The Argentine; Brazil, 30 years (except for "extreme perversity"—1938); Colombia, Ecuador, 16 years; Peru; Venezuela, 20 years; Uruguay. Central America: Costa Rica, Dominican Republic, Honduras, Panama, and the population centres of Mexico—Mexico City, Federal Jurisdiction and seven of the 28 States.

In Europe the Low and the North countries still retain the abolition of the death penalty. The greater part of Europe is, however, under martial law. Rumania has receded from abolition and restored (1939) the death penalty. (V. Pr.)

Carnegie Trusts. Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with \$135,000,000, expends its annual income in grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British Dominions and Colonies.

During 1938-39, the corporation trustees appropriated a total of \$4,846,126: library interests, \$697,200; adult education, \$204,921; fine arts and museums, \$1,157,325; research and publication, \$1,253,650; general educational purposes in schools, colleges, universities, etc., \$1,533,030. The amount appropriated since 1911 totals \$176,728,689.

The five other separately administered Carnegie organizations in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the Corporation, with endowments now ranging from \$10,000,000 to \$30,000,000, followed their established programs described regularly in their annual publications.

Carnegie Institute of Pittsburgh (1896), which comprises an institute of technology, a museum of fine arts, a music hall, a museum of natural history, a public library, and a library school, carried out its normal programs. The annual international art exhibit at the museum again attracted wide attention.

Carnegie Institution of Washington (1902), devoted to scientific research, has expended since its organization \$40,136,204 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson observatory), terrestrial magnetism, geophysics, animal and plant biology, and historical research (especially in Yucatan).

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed in the United States of America, the Dominion of Canada, the Colony of Newfoundland, and the waters thereof by persons the nature of whose duties in following their regular vocations does not necessarily require them to perform such acts, made 46 awards of medals, or of funds for worthy purposes, in recognition of acts of heroism, thus bringing the total number of awards since 1904 to 3,069, and the total of money grants to \$5,662,150.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid \$1,960,472 in retiring allowances to retired college professors, or their widows, making a total of \$36,691,614 paid for such purposes since its establishment. It has also continued, chiefly from funds provided by the Corporation, its program of educational research, including such activities as teacher testing program, graduate examination study and a comparative examination study.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, expended \$685,938 in its efforts to further friendly understanding among the

nations of the world. Continued progress was made also in the study of Canadian-American relations, the findings of which are being reported in 44 volumes, published chiefly by Yale university, Ryerson, and Oxford Presses. This activity was made possible by Corporation grants to the Endowment. (F. P. K.)

Caroline Islands: see PACIFIC ISLANDS, MANDATED.

Carter, Howard (1873-1939), British Egyptologist, was born in Swaffham, Norfolk, England, and was educated by private tutors. His first expedition to Egypt was in 1890. Two years later he assisted Sir Flinders Petrie in an excavation at Tel el Amarna. In 1907 he began a long series of excavations of royal Egyptian tombs that culminated in his discovery, on Nov. 4, 1922, of the stairway leading to the entrance of Tutenkhamon's sepulchre. This discovery, widely heralded in the world's press, enabled archaeologists to piece out perhaps the most intimate picture yet available of early Egypt. Carter also uncovered the valley temple of Hatshepsut, the tombs of Thotmes IV and Amen Hotep I and other royal and private burial places. He died in London March 2. See *Encyclopædia Britannica*, vol. 4, p. 940, and vol. 22, p. 634.

"Cash and Carry" Plan: see NEUTRALITY.

Catastrophes: see DISASTERS.

Catholic Rural Life Conference, National.

The 17th annual convention was held at Spokane, Wash., in October. Rt. Rev. Vincent J. Ryan, of Fargo, N.D., was elected president. Rev. James A. Byrne remained executive secretary, with headquarters at 240 Summit avenue, St. Paul, Minnesota. The major part of the discussions centred about the recently issued *Manifesto of Rural Life*, which offers the basic idea that "the special adaptability of the farm home for nurturing strong and wholesome Christian family life is the primary reason why the Catholic Church is so deeply concerned with rural problems." Other topics of exploration were colonization and land-settlement programs, rehabilitation of rural parishes, youth organizations, adaptations required in the curriculum of primary and secondary schools.

Founded in 1923 by the present bishop of Kansas City, Mo., the Most Rev. Edwin V. O'Hara, the Conference devoted its early effort to the task of bringing religious advantages to the spiritually underprivileged in rural districts. It endeavoured to vitalize rural parishes, originated vacation schools, conducted correspondence courses, etc. In its later development, it undertook the task of translating the Christian principles of justice and charity to rural economics, social problems, and education.

The conference is not composed of farmers or of those engaged in agricultural labours, though these are members. It is primarily an organization of lay and clerical leaders actively interested in the well-being of the farm population and in the prosperity of agriculture. It co-operates with the National Catholic Rural Life Bureau of Washington, D.C., and State and Federal agencies. In addition to the *Manifesto of Rural Life*, it has issued as its handbook, *Catholic Rural Life Objectives*, and publishes a quarterly, *Rural Life Bulletin*. (F. X. T.)

Catholic Welfare Conference, National.

This official agency of the Catholic hierarchy of the United States has for purpose the unification and co-ordination of Catholic activities. On the 20th anniversary of its founding, March 24, 1939, Pope Pius XII lauded the bishops for their "wisdom and

foresight" in "meeting the problems of these changing times," and in his American Encyclical referred to this "organization which supplies a well-adapted instrument for your episcopal ministry."

The N.C.W.C., as it is popularly called, is directed by an administrative board of ten archbishops and bishops, elected at the annual meeting of the hierarchy. Most Rev. Samuel A. Stritch, archbishop of Chicago; succeeded Most Rev. Edward Mooney, archbishop of Detroit, as chairman of the administrative board and of the executive department. The administrative board is assisted by seven bishops, chosen by itself. The general secretary is Rt. Rev. Msgr. Michael J. Ready. National offices are located at 1312 Massachusetts ave., N.W., Washington, D.C.

The activities of the N.C.W.C. are divided into departments, bureaus, and committees, each headed by an episcopal chairman:

Executive.—Directs the varied operations of the Conference. Publishes the monthly official organ, *Catholic Action*, which is used by some 10,000 study clubs, and issues or distributes pamphlets and books dealing with current Catholic topics. Conducts a bureau of immigration which handles thousands of cases annually. Assists the Confraternity of Christian Doctrine, which operates in 113 American dioceses, 22 in Canada, and 14 in Latin America. The fourth national convention, held in Hartford, Conn., was attended by 20,000. **Education.**—Engages in statistical and research work, issues publications helpful to the work of the Catholic school system, which includes 2,555,161 students, and interests itself in legislative proposals, such as the Thomas bill. **Social Action.**—Deals with problems of industry, rural life, family life, citizenship, etc. Prepares programs for national and regional discussions, and publishes a great number of pamphlets on these topics. Conducts a Woman's Institute on Industry, and regional Priests' Schools for Social Action. **Press.**—Issues the *N.C.W.C. News Service*, a weekly release of Catholic news which serves 452 publications in 24 countries. **Legal.**—Supplies information and guidance on legal and legislative matters that affect Catholic interests, and observes Federal and State legislation. **Lay Organizations.**—The National Council of Catholic Men, among other activities, sponsors the "Catholic Hour," heard weekly over 81 broadcasting stations, and maintains the Catholic Evidence Bureau. As occasion arises, represents Catholic sentiment on national questions. The National Council of Catholic Women undertakes to serve as a unifying force among women's organizations and supports a School of Social Service in Washington. **Committees.**—Chief among these are: Motion Pictures which directs the Legion of Decency; Decent Literature, which combats objectionable periodicals; Catholic Refugees, which has handled 2,756 cases during 1938 and 1939.

Statements issued by the administrative board dealt with labour relations, advocated increased efforts for international peace, called for a crusade to promote "civic virtues in a Christian democracy," deplored the social injustices toward the Negroes, expressed sympathy for Poland and authorized a committee for Polish relief, and expressed gratitude to the pope for his peace proposals, with assurance that American Catholics would "join in the efforts of their common Father."

The year 1939 marked the 20th anniversary of the issuance of the "Bishop's Program for Social Reconstruction." Ten of the 11 principal recommendations made in 1919 have been wholly or partially translated into fact. (F. X. T.)

Cattle. Further increases in the size of beef and dairy cattle herds in 1939 were reported in a number of countries. In the United States the number of cattle on farms Jan. 1, 1940, was reported by the Department of Agriculture as 68,769,000 compared to 66,789,000 a year earlier. Of the increase of 1,980,000 head, about one-fourth was in animals kept for milk and about

three-fourths in beef cattle. Milk herds in 1939 totalled 36,421,000, and in 1938 were 35,897,000, while beef cattle numbered 32,248,000 in 1939 and 30,892,000 in 1938. The average value of all per head was \$40.57 in 1939 and \$38.45 in 1938. The total inventory value in 1939 was \$2,790,213,000, an increase of \$221,962,000 over 1938 and the highest since 1930. Increased consumer buying power, owing to larger industrial activity, and abundance of feed at favourable prices led to the increase in values. Imports of cattle into the United States in 1939 were 753,570 head, of which 478,565 were from Mexico and 274,384 from Canada. In 1938 imports were 424,022, of which 285,554 were from Mexico and 137,773 from Canada. Three-fourths of the increase of cattle in 1939 were in States bordering the Mississippi river or eastward. There were sharp reductions in Texas and several western States. Possibly a larger number of cattle were being fed for market in the fall and winter of 1939 than ever before. Slaughter of cattle the first 11 months in the United States was 8,672,895 in 1939 and 9,018,470 in 1938; calves, 4,882,927 in 1939 and 5,078,392 in 1938.

War conditions in Europe and Asia made official statistics difficult or impossible to obtain in many countries.

The following data on numbers of cattle in different countries in 1939 and 1938 are from official reports of those countries, or the International Institute of Agriculture, or U.S. consular reports or Foreign Crops and Market reports of the U.S. Department of Agriculture.

Numbers of Cattle in Certain Countries, 1938 and 1939

	1939	1938
Canada	8,474,600	8,511,200
United Kingdom	8,875,200	8,761,900
England and Wales	6,762,200	6,714,300
Scotland	1,360,000	1,315,700
Northern Ireland	753,000	731,900
Denmark	3,258,000	3,186,000
New Zealand	4,565,000	4,506,000
Hungary	2,379,532	1,882,031
Netherlands	2,817,314	2,763,453
Switzerland	1,711,000	1,700,585
Estonia	705,000	660,900
Czecho-Slovakia (Jan. 1, 1939)	3,407,046	3,393,248
Latvia	2,162,500	2,102,380
Lithuania	1,103,550	1,097,340
Bohemia-Moravia Protectorate	2,280,735	2,311,037
Belgium	1,689,680	1,710,037
France	15,622,000
U. S. S. R.	63,200,000
Sweden	3,036,000
Inner Mongolia	560,000	..
Yugoslavia	4,267,339

(S. O. R.)

Cedillo, Saturnino (? -1939), Mexican rebel general and politician, was once a lieutenant of "Pancho" Villa and was brought up in the tradition of armed revolution. He became a general of the National Revolutionary Gov't in 1929 and was twice Mexican minister of agriculture, the last time in the cabinet of Pres. Lázaro Cárdenas, from June 1935 until his resignation in 1938. Cedillo was long the political "boss" of the State of San Luis Potosí, and commanded a private army of 15,000 men despite its proscription by the national Government. During the last week in May 1938, he led an unsuccessful revolt of peasants against the Cárdenas government in San Luis Potosí. He was slain on January 11 in a skirmish with Federal troops near the town of Matehuala.

Celebes Islands: see DUTCH EAST INDIES; NETHERLANDS COLONIAL EMPIRE.

Cellulose Products. The total consumption of cellulose has shown a steady increase, no one industry which uses cellulose expanding at the expense of others. Reforestation programs, particularly in the Scandinavian countries and the United States, assure a future supply of wood cellulose. The process of producing sulphite pulp from wood is fundamentally the same for both paper pulp and viscose pulp, the latter usually being a better grade.

While spruce pulp is the stock raw material for making viscose, many other materials have been tried in an effort to exploit the sources most readily available. In Germany beech wood is used; in Italy, Malacca cane and Arundo Donax reed; in the United States and Canada, Western hemlock; in France, chestnut and pine; in Australia, eucalyptus. On a small scale, bagasse has been used in the United States, straw in the Argentine, Chile, and South Africa, bamboo in India and Indo-China. In the United States a viscose-grade pulp is about to be produced commercially from southern pine. Although such sources as reeds and straw are cheap they are often non-uniform in cellulose content and are difficult to process. Also pulp mills built for wood are not suitable for handling agricultural waste materials without change in equipment. Acetate rayon, produced in considerably less tonnage than viscose rayon, is still made from cotton linters although production from a specially developed wood pulp high in alpha-cellulose is in an experimental stage.

Expansion in the rayon industry has been more in the production of staple fibre than of rayon yarn. Staple fibre is made by cutting rayon filaments into short uniform lengths which are spun in the same manner as cotton or wool instead of being used as continuous filaments. A modification of viscose rayon is that of a curly staple fibre which can be blended and spun with wool more readily than the straight fibre.

Another modification is a stronger and more elastic but less extensible filament, more heat resistant than cotton, suitable for use in automobile tire cords.

Of great assistance in the development of new pulps is the standardization of methods for their evaluation, which also aids in meeting definite specifications. Newly designed machinery utilizing plastics, stainless steel, and chromium plate, has greatly speeded up the process of conversion of pulp into viscose and thence into yarn. Rayon yarn can now be spun at the rate of 70 metres per minute and finished 5 minutes after it issues from the spinnerette.

New chemical treatments to produce rayon of a dull lustre continue to be patented.

Substitution of paper milk containers for glass bottles has been adopted in the United States on a small scale. A related development is the preparation of paper board which is nearly free from bacteria, accomplished by diluting freshly bleached virgin paper pulp with chlorinated water. (See also RAYON; PAPER; PLASTICS INDUSTRY.)

Prucha, *Milk Plant Monthly* (May 1939). (C. T. S.)

Cement. Since the product is used largely in the building industry, the cement industry has been seriously affected by the depression decline in building operations, and has shown one of the slowest recoveries found in any phase of the

mineral industries. Total cement production in the United States declined 9% in 1938, to 107,062,000 barrels. The great bulk of the output is the ordinary Portland cement; the special types of masonry, natural, and pozzolanic cements average only 1-2% of the total, while high-early-strength cement has increased to 3%.

In spite of the fact that the United States output through Oct. 1939 was 16% above that for the same period of 1938, and 6% above that for 1937, shipments had exceeded output by over 4,000,000 bbl., indicating a consumption of about 125,000,000 bbl. for the year. Canadian production through Sept. 1939 was 5% ahead of 1938, but 8% behind 1937, indicating an output of about 5,750,000 bbl. for the year, as compared with 5,519,000 bbl. in 1938.

World production, estimated at 83,000,000 metric tons in 1937, was distributed as follows: United States 24%; Germany 16%; United Kingdom 9%; Japan 8%; U.S.S.R. 7%; Italy 5%; France 5%; Belgium 3%; Czechoslovakia, Poland, India, Canada, South Africa, Yugoslavia, and Australia 8%; the remaining 15% is widely scattered in small amounts. (G. A. Ro.)

Centennials: see CALENDAR, 1940, page xx.

Central America, the region between Mexico and Colombia, embracing the republics of Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama, the Panama Canal Zone, and the colony of British Honduras. The area is approximately 222,674 sq.mi.; the population was estimated at 7,731,000 in 1939. The main population centres are on the highland plateau adjacent to the Pacific, where the population from Costa Rica to Guatemala is white, mestizo, and Indian, tending more and more to pure Indian toward the north. The low Caribbean slope, including British Honduras, is largely Negroid. A large Negro element is also present in Panama. In the republics, Government is, in practice, by dictators, with the outstanding exception of Costa Rica, and to a less degree in Panama and Nicaragua.

The Central American republics were active participants in the inter-American efforts to maintain the neutrality of the Western Hemisphere in the conflict which engulfed Europe in Sept. 1939, and Panama was host to the Inter-American congress which met on September 21. Economically, there was great uncertainty, owing to European war, and external trade declined seriously in the last four months of the year. In 1938, Central American imports totalled approximately \$74,772,000 and exports \$61,931,000 in value, declines of from 10% to 15% over 1937. Nearly 40% of exports went to the United States, who supplied 60% of imports. Imports are largely foodstuffs, as flour, and textiles, machinery, and other manufactured articles. Coffee from the Pacific uplands, bananas from the lowlands, and other tropical agricultural products (notably chicle and hemp from British Honduras) comprise the main exports. Corn and beans are grown extensively for domestic consumption. Education and literacy vary from country to country, with Costa Rica the most advanced. (See BRITISH HONDURAS; COSTA RICA; GUATEMALA; HISPANIC AMERICA AND THE EUROPEAN WAR; HONDURAS; NICARAGUA; PANAMA; PANAMA CANAL AND CANAL ZONE; SALVADOR, EL.) (L. W. BE.)

Ceramics: see FELDSPAR; GYPSUM.

Cereals. No shortage of food and feed grains in 1940, because of the various wars, is indicated by reports of the International Institute of Agriculture. The world carry-over of wheat Aug. 1, 1939, was estimated by the Institute as 687,000,000 bu., enough to satisfy all import requirements without the addition of surpluses from the new crop. Import requirements for 1939 were estimated at 618,000,000 bu. and requirements for 1940

were forecast at 600,000,000 bushels. World wheat production in 1939 was placed at 4,195,000,000 bu. compared to 4,503,000,000 bu. in 1938. The comparison is incomplete, however, owing to various governments having curtailed economic information after the outbreak of war. The world estimate does not include U.S.S.R. which produced 1,494,000,000 bu. in 1938. China, Iran, and Iraq are also not included. Sowing of winter bread grains in belligerent countries approximated the normal acreage despite shortage of labour because of the war. In the United Kingdom a large part of the grasslands have been plowed for food and feed grains, of which production will be increased, particularly oats for livestock feed. World rye production for 1939 was estimated by the Institute as 1,066,000,000 bu., of which 985,000,000 bu. was in Europe, 56,000,000 bu. in North America and 25,000,000 bu. in the rest of the world, excepting U.S.S.R. which produces approximately as much rye as all the rest of the world. World rye production in 1938 was 1,072,000,000 bu., of which 976,000,000 bu. was from the European harvest. Thirty-three countries produced 1,195,669,000 bu. of barley in 1939 and 1,101,211,000 bu. in 1938. Oats production in 1939 was 2,510,449,000 bu. from 26 countries, compared to 2,632,628,000 bu. in 1938. Here again the comparison is inexact because of war-time restrictions on information. No complete figures for corn are available, but the United States which produces most of the corn had a harvest of 2,360,060,000 bu. for grain in 1939 compared to 2,303,265,000 bu. in 1938 when the world crop was 3,868,953,000 bushels. In addition to the corn crop for grain 31,195,000 tons of silage were harvested and 5,699,000 ac. of corn were "hogged down" or used for forage.

(S. O. R.)

Céspedes y Quesada, Carlos Manuel de

(1871-1939), Cuban statesman, was born in exile at New York city on August 12, the son of a wealthy planter who was leader of the separatists in the Cuban Ten Years' war (1868-78). He was educated in the public schools of New York city, in Germany, and France, and at the University of Havana, where he received a law degree. From 1895 to 1898 he was a colonel in the Cuban Army and governor of Santiago province. After the Cuban declaration of independence he was for six years (1902-08) vice-president of the house of representatives. In 1909 he entered the diplomatic service and became successively minister to Italy, Argentina, the U.S.A., France, and Great Britain. From 1922 to 1926 he was secretary of State; he resigned after a series of disagreements with Pres. Gerardo Machado, whom he later conspired to overthrow. After Machado's resignation in 1933, Céspedes was sworn in as president, but he served for only 23 days (August 12-September 5) before the revolutionary junta demanded his resignation also. Thereafter he became minister to Spain until his retirement in 1935. He died in his home at Vedado, a suburb of Havana, on March 28, the day before the death of his long-time enemy, Machado (q.v.).

Ceylon. Area 25,332 sq.mi.; pop. (est. Dec. 31, 1938) 5,830,000. Chief towns (pop. census 1931): Colombo (cap. 284,115); Jafna (45,708); Galle (34,424); Kandy (37,147). Governor, Sir Andrew Caldecott; languages, English, Sinhalese, Tamil; religions, Buddhism and Hinduism the chief.

History.—The island suffered a set-back from its return of prosperity in 1937; the visible balance of trade having fallen from Rs. 88 millions in that year to Rs. 49 millions in 1938. Constitutional difficulties and racial animosities did not help the situation.

Industrial progress has been noteworthy. In May, Rs. 14½ millions were voted for an important hydro-electric scheme. In

August a state-aided bank was opened with an authorized capital of Rs. 17½ millions. It will co-operate with the department of commerce and industries, which was established in 1938 for experimenting in new industries which, in default of private enterprise, the government hopes to organize:—coir, plywood, cement.

Education.—In 1938: Primary, Sinhalese and Tamil: schools 6,151; scholars 702,097; assisted schools 3,007; scholars 250,831 boys, 178,967 girls.

Banking and Finance.—Revenue (actual 1938-39) Rs.117,426,650; (est. 1939-40) Rs.123,484,600; expenditure (actual 1938-39) Rs.120,502,590; (est. 1939-40) Rs.129,504,965; public debt (Sept. 30, 1938) Rs.194,191,333; currency: Rs.1 = 100 cents = 1s.6d.

Trade and Communications.—Overseas trade, merchandise, 1938: imports Rs.235,529,101; exports (domestic) Rs.263,534,522; re-exports Rs.21,288,000. Communications and transport 1938: roads, main surfaced, 4,485 mi.; railways (117 mi. narrow gauge), total 960 mi.; shipping, entered 1938, 13,228,439 net tons; motor vehicles licensed (Dec. 31, 1938): 21,044 motor cars and taxis; 4,320 trucks and vans; 2,625 omnibuses; 2,992 cycles; wireless receiving set licences (Dec. 31, 1937) 4,911; telephone instruments in use (1938) 10,424.

Agriculture.—Production, 1938 (exports), in metric tons: copra (including coconut oil), 197,800; tea, 106,900; rubber, 60,000.

Chain Stores.

The record of the corporate chain store for 1939 is one of the best in the history of the chain store industry. In most fields, the corporate chain showed significant increases in volume as compared with 1938, and in some cases as compared with any previous year. Moreover, the gain in net profits appears to have been more substantial than the gain in volume.

The record for 30 representative corporate chains shows that sales increased about 11% during 1939 as compared with an increase of somewhat less than 7% in general retail trade. The month of December set a new mark for many corporates and several reported December sales as better than for any month in their history.

On the legislative front, the corporate chain fared reasonably well during 1939. The Patman "death sentence" measure, re-introduced into Congress as H.R. 1 in 1939 did not receive a hearing and remains lodged with the Ways and Means Committee.

During 1939, in spite of the fact that about 90 anti-chain measures were sponsored in 34 State legislatures, no new State was added to the list of 22 which obtained at the beginning of 1929. Only four States (Montana, North Carolina, South Dakota, and Tennessee) passed chain-store tax measures and in each instance the action merely amended existing laws.

On March 21, 1939, the Kentucky chain store tax measure of 1934 was held unconstitutional by the Kentucky Court of Appeals. On June 19, 1939, the Pennsylvania chain store tax measure of 1937 was declared unconstitutional by the Pennsylvania Supreme Court. In February, the New Jersey Supreme Court voided municipal taxes on self-service markets. In November, the Georgia Supreme Court voided a municipal tax on the corporate chains based upon the total number of units operated in the United States and which would have cost the A.&P. chain \$1,200-\$1,400 per year for each store operated in Columbus, Georgia.

Thus, the year 1939 closed with 20 anti-chain State tax measures in effect, with some indication that punitive municipal chain taxes were less likely, and with no serious threats of new State chain tax measures for 1940, since only nine legislatures will be in session and since four of these nine held sessions during 1939 without passing such legislation.

In important respects, the most significant legal development during 1939 occurred in Colorado and confirmed the conclusion that there can be no assurance that the difference between decentralized and centralized ownership will forever exempt the "voluntary" and the "co-operative" chain from special taxation. On May 29, 1939, the Colorado Supreme Court held that the Gamble-Skogmo Company, owning and operating a chain of five automobile supply stores and having 35 additional, independently owned stores affiliated under a franchise plan and a "tight" buying contract, constituted a chain under the act of 1934. Immediately, Colorado's attorney general held that all automobile dealers in the State under franchise for individual makes of cars and all service station operators under contract to distribute individual brands of gasoline were also taxable as "chain" units under the act. In October, Colorado's State treasurer announced intentions of filing tax claims against all independents operating in groups under the wing of a single wholesaler.

While it is often said that few "voluntaries" or "co-operatives" have such stringent contracts with regard to the supervision of merchandising activities by the wholesale supplier as to make these member organizations in effect a chain for purposes of taxation, 1939 clearly indicates that there is some political intention to give to the voluntary chains "the same medicine that the corporate chains have been forced to swallow for the last decade." This intention is likely to find a legal way of accomplishing its purpose and hence many of the State chain store tax laws may soon reach the pockets of the independents who sponsored them, since, in such important fields as food, gasoline, auto accessories, and tires, very large numbers of "independents" operate under group merchandising plans.

During 1939 the merchandising efforts of the corporate chain were largely concentrated on: (1) the enlargement and modernization of existing stores, and the closing of smaller, unprofitable units, (2) the establishment of super-markets or large self-service units, (3) an increase in the variety of merchandise sold, (4) increasing direct purchases from suppliers who deal only with large buyers, (5) the development and promotion of chain store brands, and (6) the cultivation of public good will.

In a year when anti-chain taxation has been at a low ebb, the number of chain store units has decreased. The process of weeding out unprofitable neighbourhood stores and of establishing large self-service stores—particularly in the food field—has gone on, if at a somewhat slower pace than in previous years. By the middle of 1939, reliable estimates indicated that about one-third of the sales of the A.&P. chain were handled by either super-markets or large self-service stores.

The threat of serious competition for the corporate chain from independent "super-markets" has diminished. Estimates now indicate that about 46% of all the "supers" are old-line corporate chain super-markets, while 38% are independent "supers" and 16% are super-market chain units not operated by old-line corporate chains.

Moreover, the fear of the growing number of State Unfair Sales Acts—loss leader laws—has operated to limit the establishment of independent "supers" and the real estate promotion of the "super" idea.

During 1939, the corporate chains spent about \$126,000,000 on store construction and modernization, an increase of 12.2% over similar expenditures in 1938. Of this amount, about \$28,000,000 was expended in the grocery field, largely in connection with the opening of self-service markets handling wide varieties of food products. Similar expenditures in 1938 totalled about \$17,000,000.

In the main, the corporate chain has met the loss of brokerage and allowances under the restrictions of the Robinson-Patman Act by increasing its direct purchases on a net price basis from those

suppliers who cater only to big buyers and who consequently do not run the risk of discriminating against the "dozen-lot customer." The year 1939 witnessed the filing of several complaints by the Federal Trade Commission against "voluntary chains" for alleged discriminatory brokerage and allowances so that the corporate chain is heartened by the indication that the enforcement of the Robinson-Patman Act will not unduly penalize the corporate in favour of the voluntary.

The corporate chains have continued to seize upon every merchandising opportunity to cultivate a public appreciation of their economic importance. The food chains have actively co-operated with the Government's food stamp plan to distribute surplus agricultural commodities. In some instances food chains undertook the promotion of surplus foods designated by the Department of Agriculture in cities where the stamp plan was not in effect. Producer-consumer drives were continued by the corporate chains and moved surpluses of citrus fruits, dairy products, prunes, fresh vegetables, poultry and eggs, and apples. A greater variety of corporate chains co-operated in the 1939 producer-consumer drives—practically all the corporates assisted in the promotion of the consumption of cotton; the drug, variety, confectionery, and other chains operating soda fountains as well as the food chains devoted the month of June to the promotion of milk and dairy products.

With the increasing evidence of serious rifts in the ranks of the organized anti-chain groups, with a growing appreciation of the fact that punitive anti-chain measures may boomerang upon their independent sponsors, with a widening good will toward the corporate on the part of the farmer, organized labour, and the general public, and with complete faith in the alertness and flexibility of its management personnel, the corporate chain appears to face 1940 with a new confidence. (See also LAW [CASE]: *Trade Regulation*; RETAIL SALES.) (G. R. C.)

Chamberlain, Arthur Neville (1869–), British statesman (see *Encyclopædia Britannica*, vol. 5, p. 201), prime minister of Great Britain since May 28, 1937. During 1939 Mr. Chamberlain's popularity which, on the disappointing aftermath of the Munich Agreement of Sept. 1938, had shown signs of deteriorating, steadily rose, and long before its close he had, certainly insofar as his war policy was concerned, the whole country united behind him. The year opened with his visit, in the company of Lord Halifax, to Rome (January 11–14), where he had important conversations with Mussolini and the King—a good understanding, though no actual agreement, being reached—and was received in audience by Pope Pius XI, less than a month before His Holiness's death. On February 7 Mr. Chamberlain opened the Palestine conference and on March 2 made history by being the first Conservative prime minister to attend a reception at the Soviet embassy; but following the German annexation of the Czech state (March 16) his time and energies were absorbed by the crisis and ensuing European war (*q.v.*).

On January 5 Mr. Chamberlain welcomed President Roosevelt's defence in his message to Congress of religion, democracy, and international good faith as "yet another indication of the vital role of American democracy in world affairs"; from Birmingham on March 17 he broadcast a reasoned defence of his foreign policy, and before Conservative women in London on May 11 he justified the introduction of conscription and made it abundantly clear that, if ever called upon to do so, Great Britain and France would unhesitatingly honour their pledge to Poland. At Cardiff on June 24 he exposed again the hollowness of the German "encirclement" plea, and warned Japan that the British Government could not submit to dictation.

THE FAMOUS UMBRELLA was forged into a sword after Hitler's seizure of Czechoslovakia and Memel in Mar. 1939. Cartoon by Temple in *The Times-Picayune*, New Orleans

A Scottish holiday in August was shortened by the crisis, and, after his dramatic broadcast announcement at 11.15 A.M. on Sunday, September 3, that "this country is at war with Germany," one of his first acts was to broadcast (September 4) in German to the German people that Britain was fighting not them but "a tyrannous and foresworn regime which has betrayed not only its own people but the whole of Western civilization and all that you and we hold dear." From September 10 onward Mr. Chamberlain gave each week in parliament a review of the war situation, and on November 26 broadcast again, defining the British war aims and giving, in general terms, a forecast of the new Europe. On December 5 he visited the British troops in France; he was later shown a section of the Maginot Line by General Gamelin, and returned to England on the 19th after attending a dinner given in his honour by M. Daladier at the Quai d'Orsay the previous evening. Mr. Chamberlain during the year had important interviews with Mr. de Valera, M. Gafencu, and the Prince-Regent of Yugoslavia, among others; he was proposed for the Nobel Peace prize, streets in Cannes and Lisbon were named for him, and he received honorary degrees from the universities of Oxford, Edinburgh, and Strasbourg. (L. H. D.)

Chambers of Commerce. Business activity in the United States was notably stronger in 1939 as compared with 1938. Chambers of commerce across the country were particularly pleased with this and with their efforts to reduce unemployment. They were likewise encouraged by the more favourable public attitude toward business and the more constructive policies supported by men in public life.

The chambers continued their various promotive and service activities, and their attention to such subjects as taxes, the expenditure of public funds, and governmental regulation. They maintained their interest in world trade developments. After war broke out in Europe, many chambers were called upon for special

services relating to export and import business.

Trade and industrial associations, State and local chambers of commerce co-operated in the Chamber of Commerce of the United States. This organization and all of its affiliates carried on the "What Helps Business Helps You" educational campaign for wider understanding of the part business plays in American progress.

Abroad.—For the chambers of commerce in Great Britain and Northern Ireland, the year 1939 was remarkable for the attention given to certain national and international questions. The national defence program, growing tension in the international field, increasing complexities in meeting export trade demands, altering laws and regulations governing home trade and industry, new financial and taxation problems, were important in chamber work until the outbreak of war. The individual chambers and the Association of British Chambers of Commerce then bent their energies to further tasks presented for local and national service.

(W. G. Cy.)

Chandler, Charles deForest (1878-1939), American aeronautics authority and balloonist, was one of the first men in the United States to recognize the military importance of aviation after the Wright brothers had made their initial heavier-than-air flights. Born in Cleveland, Ohio, on December 24, he was educated at the Case School of Applied Science and was appointed first lieutenant of the U.S. Army in 1901. He made his first balloon flight in 1906 and was a member of the committee which conducted trial flights of the first military plane bought by the Army from the Wright brothers in 1908. In 1912, while he was commander of the first Army aviation school at College Park, Md., he demonstrated the practicability of machine-gun fire from a plane in flight. During the World War he was chief of the balloon section of the U. S. Air Service in France and was decorated with the Distinguished Service medal. He was appointed colonel in 1917 and retired from active service in 1920, after which he devoted much of his time to writing on aeronautics. He died at Washington, D.C., on May 18.

Channel Islands: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

Cheese. Perhaps the most marked war-time development in the cheese market in 1939 was the cessation of Finnish shipments to that country's usual outlets, the United States, Britain, and Belgium, and the increased Swiss production to supply those markets. In Canada the first plan of the British war-time food control offered producers a net of only about 10½¢ per pound. The British Government later agreed to accept at better prices all Canadian cheese that might be shipped, consular ad-

vices reported. In the United States, cheese production was slightly less than 1938 and prices were abnormally low until the general rise in commodities in the autumn, when cheese prices stiffened. In the first ten months of 1939 production of United States cheese was reported by the Department of Agriculture as 462,788,000lb., or a decline of 8% from 1938 production in the same period. Cheese stocks in the United States Nov. 1, 1939, were the lowest since 1932, or 94,000,000lb., a decrease of 19% in comparison with Nov. 1, 1938. During the war period in 1939 there was little change in cheese exports and imports in the United States. In 1914-15 United States cheese imports averaged 50,000,000lb. annually, or about 14% as large as domestic production. In 1917 and 1918 United States cheese imports averaged 7,000,000lb. yearly and in 1934-38 the average annual imports were 54,279,000 pounds. Cheese exports from the United States rose abruptly during the War 1914-18 to about 12% of domestic production. Cheese shipments from principal exporting countries were reported as in the accompanying table by the International Institute of Agriculture for the first eight months of 1939 and 1938 and for the twelve months of 1938.

(S. O. R.)

Chemical Warfare. The student of chemical warfare is struck by three outstanding facts, as developed from the war in Europe in 1939:

- Failure to employ chemicals in the Polish campaign.
- Failure to employ chemicals in bombing raids on Great Britain, France, or Germany.
- Extent of gas-defence preparation by both the civilian population and military forces.

Poland is reported to have had mustard gas, an ideal defensive weapon, available for use. Effective use of it would have materially slowed up the German advance. This failure may have been due to any one or all of the following factors:

(1) The immediate destruction, or immobilization, of the entire Polish air force at the outbreak of the war, thus eliminating the means of long-range reconnaissance to give information as to routes, strength, and formation of the German advance. It also left Poland no means of bombing or spraying from the air.

(2) Fear of retaliation to a far greater extent than was possible for Polish use. This may be ascribed to the fact that Germany could literally lay down "tons" of chemicals to "pounds" by the Poles.

Germany did not use chemicals because they are unnecessary in a one-sided war where one powerful force quickly overwhelms a vastly inferior force. In a lightning-like advance, similar to that of the Germans, the use of persistent chemicals of the mustard gas type is unnecessary and might be of considerable detriment to a force advancing over a broad front.

The non-use of chemicals in bombing raids may be ascribed in part to the fact that during 1939 the war has been largely limited by diplomacy. Both sides disclaim any desire for war and have tended from the beginning to refrain from any act which would mark them as the aggressor and thus subject them to the opprobrium of the world. While the feeling that chemical warfare is more inhumane than other methods of war is illogical and not supported by facts, that sentiment undoubtedly exists. There may also be the fear of retaliation which would bring real war to the home population before other methods of achieving victory have failed. Again, good strategy does not invite retaliatory attacks prior to ability to make an overwhelming attack on the enemy.

Preparations for gas defence have been quite thorough. The issue of a gas mask to each individual soldier and training of troops in chemical defence are normal to all modern armies. With the development of long-range bombing aeroplanes, it became

*Jan. 1 to July 31, 1939. †Jan. 1 to May 31, 1939.

apparent that the threat of death and destruction was no longer confined to the forward areas of the battle zone. Certain foreign military writers stressed the importance of concentrated attacks by long-range bombers upon cities, manufacturing, supply, or transportation centres well within the zone of the interior. Such attacks could be made by chemical bombs and spray, as well as by high-explosive and incendiary bombs. This real danger to the civilian population at home—the heart of an army—presented a new threat. Consequently, long before the outbreak of the European war in 1939, all of the leading nations of Europe were devoting considerable money, technical skill, and manufacturing effort toward adequate defence preparations for the civilian population. These included the provision of a gas mask for every citizen, gas and bomb-proof inclosures and thorough education of the public in protection against chemicals.

Civilian defence became front-page news during the latter half of 1939. The gas mask was no longer limited to the soldier. Almost every periodical pictured European civilians in all walks of life wearing or carrying a gas mask. The threat of gas warfare being particularly serious to Great Britain, defence preparations were most thorough in the British Isles, and photographs from that country included the King and Queen, other royalty, and factory workers carrying gas masks. The gas mask has become essential for street wear, and dress designers have fashioned gas mask carriers to harmonize with street apparel.

These preparations for defence against chemical warfare are clearly indicative of a real danger. While nations remain secretive about and are reluctant to admit their plans for use of chemicals, it is a fact that all European nations have excellent systems for securing information. None of them would spend the money or effort on gas defence unless they were sure that the potential threat might suddenly develop into a vital surprise attack against them. Probably no single factor is better insurance against enemy attack than complete defensive equipment and training.

Whether or not the hesitation to use chemicals will continue, is a matter of conjecture. Heretofore chemicals have always been used as a last resort when other means have failed. If a quick decision can be gained by their use, before effective retaliation by the enemy, there appears to be no doubt but that they will be used. Necessary factors for use are availability and the means to lay them down in quantity on the desired target. All of the leading powers in Europe are believed to have them. Most effective use requires that chemicals be laid down in quantity against unprotected individuals or as a surprise attack against those with defensive equipment. From reports of war operations in general, it is doubtful that humanitarian reasons have been, or will prove to be, any deterrent.

Chemical warfare is a weapon for industrial nations. The leading nations of Europe are probably well prepared for use of chemicals in war, either offensively or defensively. When and if they are used, it should be expected they will be used in quantities unheard of during the World War. Targets will be literally deluged with chemicals in order to achieve immobilization of enemy troops, aeroplanes, transportation, and centres of supply, manufacture, or other activity. Wholesale destruction of life cannot be secured when effective defensive equipment is available. Even under heavy gas attack, loss of life should be small, and the greatest advantage would be from the resultant confusion, panic, and disorganization of movement and supply.

Chemical Offence.—The trend of development continued to be toward use of chemical and incendiary bombs, and spray apparatus for liquid chemicals. Medium calibre, rapid-firing mortars, often mounted in a track-laying vehicle or truck, are being developed for ground troops. These mortars are essential for establishment of smoke screens to protect infantry from machine gun or

other fire. Incendiary bombs were used effectively against Poland and Finland much as they were used in Ethiopia and Spain. A special thermit mixture in an electron metal container was especially effective. Other developments reported from Europe are a flame-throwing tank and a fast-moving light tank for projection of chemicals. This tank has not been operated under war conditions, but discharges its chemical content upon reaching the vicinity of its target on or near the enemy front lines and is a development from the cylinder which depended entirely upon the wind to carry its contents on to the enemy.

Chemical Defence.—The black-out of cities to prevent accurate bombing at night received actual test under war conditions in Europe late in 1939. The greatest protection to the civil population was assured by education of the public, by the provision of individual gas masks and the erection in cities of convenient bomb-proofs and gas shelters. As a result, civilians of Great Britain, France, and Germany remain quite calm to this threat. While no gas attacks were made on any city, this equipment and education have gone far towards eliminating the hysterical fear and panic which otherwise could be expected.

Gas masks have been much improved as to fit and comfort. The canisters have a reduced breathing resistance and, in addition to neutralizing the toxic war chemicals, are provided with filters for the efficient removal of irritant smoke particles. Air purifiers for collective protection operate like giant gas mask canisters to purify the air, after which it is pumped into bomb-proofs and other shelters to provide ventilation and gasproofing. Mustard-proof clothing and methods of decontamination are necessary means for gas protection. In the United States, efforts have been continued toward providing adequate protection to its army. (See also *ARMIES OF THE WORLD: Chemical Warfare*; *EUROPEAN WAR*; *MUNITIONS OF WAR: Gas.*) (HA. SH.)

Chemistry. **Boron Hydrides.**—Boron has been regarded as a trivalent element because its common compounds reveal it in this light [boric acid, $B(OH)_3$; boron fluoride, BF_3]. Its simplest hydride, on this basis, should be borine, BH_3 , but actually the simplest known hydride is diborane, B_2H_6 . Schlesinger and Burg of the University of Chicago have given extensive study to the problem of boron hydrides. One reason for interest in this field is the electron structure of these compounds. In borine there are six valence electrons, three from the boron and three from the hydrogens. In diborane the 12 valence electrons are insufficient to permit a pair of electrons to hold each hydrogen to a boron atom and yet leave any for the borons to bind each other. Since the electron-pair type of bond is the one commonly encountered in other compounds, it is a question of wide interest to study substances which must deviate from this general plan.

Schlesinger has demonstrated that borine may have a transitory existence in certain reactions. With carbon monoxide at $100^\circ C.$, diborane changes to borine carbonyl, BH_3CO , a gas which decomposes easily to diborane and carbon monoxide. Trimethylamine reacts with borine carbonyl at room temperature to yield borine trimethylamine, $BH_3N(CH_3)_3$, a stable solid.

The reaction of diborane with ammonia at $-120^\circ C.$ is another reaction wherein the boron atoms separate at some stage of the process. Two molecules of ammonia are absorbed ($B_2H_6 \cdot 2NH_3$) but the evidence seems well established that the compound produced is an ammonium salt of this structure, $NH_4^+(BH_3-NH_2-BH_3)^-$, wherein the boron atoms no longer hold each other. The salt reacts with sodium (in liquid ammonia at -80°) to produce one equivalent of hydrogen per mole of diborane involved. It reacts also with diborane itself to form a volatile liquid, $BH_2-NH_2-BH_3$. The latter reacts with acids to form boric acid, hydrogen and ammonium ion.

Another reaction where the borine fragments from diborane appear as intermediates is with aldehydes, ketones or esters. With acetone, the simplest ketone, the final product is diisopropoxyborine, probably as follows: Acetone, $(\text{CH}_3)_2\text{C}=\text{O}$, adds to one equivalent of borine (from B_2H_6) and forms $(\text{CH}_3)_2\text{C}=\text{O}-\text{BH}_3$. The latter readjusts its atoms to give isopropoxyborine, $(\text{CH}_3)_2\text{CH}-\text{O}-\text{BH}_2$. This substance adds and readjusts itself to a second acetone molecule as before, to produce diisopropoxyborine, $[(\text{CH}_3)_2\text{CH}-\text{O}]_2\text{BH}$. Water hydrolyzes this compound to isopropyl alcohol.

In other reactions, Schlesinger prepared dimethyldiborane and proved that its structure was symmetrical since it reacted with water to produce methylboric acid and hydrogen.

Sodium and Acyl Chlorides.—In the familiar Wurtz reaction, sodium withdraws the chlorine from an alkyl chloride such as butyl chloride, $\text{C}_4\text{H}_9\text{Cl}$, and two butyl radicals unite to form octane, C_8H_{18} . An acyl chloride ($\text{R}-\text{CO}-\text{Cl}$), if treated with sodium, might be expected to yield diketones, $(\text{R}-\text{CO}-)_2$, but it has not been found easy to control this process. Working with larger acyl chlorides wherein the R in RCOCl represents $\text{C}_{11}\text{H}_{23}$ to $\text{C}_{17}\text{H}_{35}$, Ralston and Selby of Armour and Company found that diketones were indeed formed in the initial stages but that continued reaction with sodium yielded a disodium derivative, $\text{NaO}-\text{CR}=\text{CR}-\text{ONa}$, which reacted with more of the acyl chloride to yield diacyl derivatives, $\text{RCOO}-\text{CR}=\text{CR}-\text{OCOR}$.

Carbohydrate Configuration.—Two relatively new reactions of sugars were applied frequently in 1939. One is the oxidation with lead tetra-acetate. This reagent cuts the carbon-carbon bond of a glycol structure ($-\text{CHOH}-\text{CHOH}-$). If the other hydroxyl groups of carbohydrates are protected against such cleavage, as by changing them to ethers or acetals, controlled scission occurs. In this way, H. O. L. Fischer prepared acetone-L-glycerose and acetone-D-glycerose from the 1, 2, 5, 6-diacetone derivatives of L-mannitol and D-mannitol, respectively. Similarly, Hockett has severed the 4-carbon chain of methyl erythroside into 2-carbon units, and the 6-carbon chain of methyl L-fucoside into 3-carbon units.

Periodic acid cleaves the glycol portion of a carbohydrate in much the same way. In the hands of C. S. Hudson this has proved to be a powerful tool for the determination of ring size and asymmetric configuration. Mannose, trehalose, levoglucosan and higher carbohydrates have been investigated in this manner.

Oesper and Deasy have improved the preparation of lead tetra-acetate. They passed chlorine into the reacting mixture of red lead, acetic acid and acetic anhydride. Without the chlorine more lead diacetate is formed than lead tetra-acetate, but with chlorine the latter was the chief product.

Starch and Cellulose.—In spite of repeated attacks on the problem, the bigness of starch and cellulose molecules has remained mostly conjectural. Both are known to be built up exclusively of glucose units, but the question is: how many such units? Wolfrom, Sowden and Lassettre have given a fresh approach to this problem. They treated potato starch or methylated cellulose with cold, fuming hydrochloric acid in the presence of a reactive sulphur-containing compound, namely, ethanethiol. As the acid split the starch or cellulose molecules into smaller units, the ethanethiol attached itself at the point of rupture. Then, at definite time intervals the sulphur content was determined, more sulphur being found with experiments of longer duration. By plotting the results and extrapolating back to zero time these investigators calculated that the starch was composed of 16-24 glucose units and the cellulose of 330-470 such units.

Lignin.—Wood is made up chiefly of cellulose and lignin. For paper, cellulose is the desirable component and lignin is removed. After removal, it is usually discarded, hence the study of this

CHEMICALLY TREATED WATER is the synthetic "soil" in which these nasturtiums are grown; by means of hydroponics or aquaculture, the lack of boron in the flowers' food can be carefully studied

waste material is one of great economic significance.

Two broad approaches to the separation of lignin from cellulose have been in vogue. One method depends on the removal of the cellulose by hydrolysis, leaving the lignin as an insoluble residue. For this purpose resin-free wood flour may be left with 70% sulphuric acid or fuming (42%) hydrochloric acid. The other method depends on the removal of lignin from the cellulose. The sulphite reaction, for example, is commonly employed in paper manufacture. Delignification is induced by heating the wood under pressure with acid sulphites. Water-soluble ligninsulphonic acids are formed. Extraction with alkali, or phenol, or alcoholic hydrochloric acid are other schemes for extracting the lignin.

Hibbert and co-workers at McGill university reported in 1939 on their extensive studies on lignin. Their method of extraction was "ethanolysis," or boiling with ethanol (ethyl alcohol) and 3% hydrochloric acid. Lignin and phenolic substances were in the alcohol solution. The phenolic substance from soft wood (spruce) was shown to be para lacylguaiacol, $\text{CH}_3\text{CHOHCO}-\text{C}_6\text{H}_3(\text{OCH}_3)-\text{OH}$. This phenol was found also in the extract from hard wood (maple) but it was accompanied by a related compound which

differed only in having another methoxyl group, $\text{CH}_3\text{CHOHCO}-\text{C}_6\text{H}_2(\text{OCH}_3)_2-\text{OH}$, on the aromatic nucleus. The first of these may be referred to as the "guaiacyl" building unit of lignin and the second as the "syringyl" building unit. Syringaldehyde and syringoylacetalddehyde, $\text{HCOCH}_2\text{CO}-\text{C}_6\text{H}_2(\text{OCH}_3)_2-\text{OH}$, were among the other products identified in experiments with maple wood. Experiments with jute fibre, rye straw and corn stalks also led to the isolation of these compounds containing the syringyl radical. Hibbert concludes that these results indicate the presence of syringyl derivatives in the lignin constituents of all angiosperms, for example in corn or rye as monocotyledons and in jute or maple as dicotyledons. Hibbert regards pyruvic aldehyde CH_3COCHO , as the key substance in the synthesis of lignins, tannins and plant pigments. Reaction of pyruvic aldehyde with guaiacol, $\text{C}_6\text{H}_4(\text{OCH}_3)\text{OH}$, for example, yields hydroxyacetylguaiacol, $\text{CH}_3\text{COCHOH}-\text{C}_6\text{H}_3(\text{OCH}_3)-\text{OH}$.

In alkaline surroundings this rearranges to lactylguaiacol, mentioned above, which in turn condenses with like molecules to form lignin.

Vitamin B₆.—Another vitamin, associated with B₁ in rice chaff, is B₆. Its identity was revealed in 1939. Vitamin B₆ represents that factor of the vitamin B complex which prevents or cures an acrodynia-like dermatitis in young rats. Also, severe microcytic hypochromic anaemia develops in puppies when the rat anti-dermatitis factor is apparently the only missing component of the diet.

A group of chemists from the laboratories of Merck and Company (Harris, Folkers, Stiller, Keresztesy and Stevens) have not only established the structure of this vitamin but also have synthesized it. The vitamin is 2-methyl-3-hydroxy-4,5-bis(hydroxymethyl)pyridine, $\text{CH}_3(\text{HO})\text{C}_5\text{HN}(\text{CH}_2\text{OH})_2$. Oxidation of the CH_2OH groups to COOH groups, yielding 2-methyl-3-hydroxy-4,5-pyridinedicarboxylic acid, was important evidence in solving the structure. Its synthesis was effected, starting with ethoxyacetylacetone and cyanoacetamide. Kuhn and co-workers in Germany announced the same structure in independent work. Eakin and R. J. Williams and also Schultz, Atkin and Frey have shown that crystalline vitamin B₆ is a growth-promoting factor for yeast.

Vitamin K.—Since 1930 investigators have reported a bleeding tendency in chickens reared on artificial diets. In 1935, Henrik Dam and Fritz Schonheyder of Copenhagen reported that the deficiency factor causing the haemorrhages was a fat-soluble substance. Dam named it vitamin K (*Koagulations-vitamin*). Bioassay methods were developed by Dam, by Almquist in California and by Doisy in St. Louis. Dried alfalfa leaf meal and putrefied sardine meal proved to be satisfactory sources of K. By 1937, Almquist had perfected a process for extracting the anti-haemorrhagic vitamin from dried alfalfa with hexane.

The use of vitamin K in obstructive jaundice was proposed by Quick of Milwaukee in 1937 on theoretical grounds. Since then it has been established that the bleeding tendency or lack of blood clotting so often seen in patients having biliary fistulas or obstructive jaundice is due to abnormal lowering of the plasma prothrombin level and that usually the bleeding tendency can be relieved by vitamin K therapy.

In 1939 several groups of investigators attacked the chemical side of the problem. Besides Doisy, Almquist and Dam, the groups included Riegel and co-workers of Northwestern university and elsewhere, Fernholz of the Squibb Laboratories, Kuhn of Germany and Anderson of Yale. It was Doisy's group that announced the isolation of crystalline vitamin K from alfalfa extract. By chemical reactions and ultra-violet absorption spectra they established it as a derivative of naphthoquinone. Oxidation experiments showed that it was probably 2-methyl-3-phytyl-1,4-naphthoquinone and this was confirmed by synthesis. The

phytyl group, which is found also in chlorophyll, is $\text{H}-[\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2]_3-\text{CH}_2\text{C}(\text{CH}_3)=\text{CHCH}_2-$, or simply $\text{C}_{20}\text{H}_{39}-$.

Curiously enough, it was shown that the phytyl group was non-essential for the efficiency of the vitamin. Both 2-methylnaphthoquinone and 2-methyl-3-hydroxynaphthoquinone (known as "phthiocol") possess activities comparable to vitamin K.

Vitamin E.—This anti-sterility factor (as tested with female rats) occurs especially in the unsaponifiable portion of wheat-germ oil, corn-germ oil or lettuce oil. The phytyl group is present in its structure also. L. I. Smith and co-workers at Minnesota have shown recently that here again the phytyl group is not a specific factor, for a considerable number of substances other than vitamin E also display vitamin E activity. This lack of specificity with vitamins E and K is striking since there are no substitutes for the other known vitamins which have been identified chemically. (See also VITAMINS.)

Nobel Prizes.—The 1938 prize in chemistry was awarded in 1939 to Richard Kuhn of Berlin. The 1939 prize was divided between Butenandt of Berlin and Ruzicka of Zurich. Kuhn isolated vitamin B₂ or riboflavin. Butenandt isolated androsterone and Ruzicka first synthesized this male hormone. The 1939 prize in medicine is of interest to chemists also. It went to Domagk for his work on "prontosil," forerunner of sulphanilamide.

(C. D. Hu.)

Chemistry, Applied. As the chemical accomplishments of 1939 parade before us many receive merited applause. The most spectacular are those in the field of pharmaceutical or medicinal chemistry and in the broad field of resins. There have been some notable advances in metals, in glass, in chemicals and equipment for their manufacture, in exploratory work in pure chemistry, and in a number of important miscellaneous items.

Research with derivatives of sulphanilamide goes forward at an accelerated pace stimulated by the success already achieved in the better control—if not the cure—of many diseases. Sulphapyridine and sulphathiazole have come to the aid of the physician in the treatment of the many types of pneumonia, for some of which we have had no serum. Hundreds of derivatives of sulphanilamide have been made and tried, with only a few offering improvements, but those are of vital interest and the search continues.

Synthetic vitamins and hormones have been added to a growing list with vitamin K synthesized very soon after the determination of its structure. Indeed, several groups were engaged in a friendly race in this work. The vitamin is the one responsible for coagulation of the blood, and while inefficient in haemophilia is important in many operative cases. Threonine is one of the proteins essential to the maintenance of life. It can now be synthesized simply and economically, the basic raw materials being coke and water. Its availability promises to be of much importance in nutritional studies. Crystalline insulin was patented during the year, and it was learned that aluminium oxide in very small amounts can prevent silicosis. Further tests in factories where colour matching must be made with precision demonstrated the necessity of vitamin A in maintaining an adequate supply of visual purple to prevent fatigue. It was also learned that a diet of corn sugar or molasses prevents ketosis, a disease which cuts milk production and inflicts economic loss in dairy herds.

Among advances in preparation and preservation of foods, the "Tender Rayed" process should be mentioned. This is one in which meat can be stored at a temperature sufficient to promote the tendering of connective tissues by enzymes while spoilage is prevented by ultraviolet rays in a carbon dioxide atmosphere.

Cryovac is a designation for a new technique in enclosing meats in a thin rubber pouch which is shrunk under vacuum to fit the contents exactly, thereby preventing freezer burn and undue loss of moisture, with improvement of product after quick freezing.

Three or four advances in the field of resins merit special mention. Nylon, discovered late in 1938, was further perfected during 1939, and some of the first synthetic fibre made its appearance on the market in the form of sewing thread, fishing leaders and lines. Bristles for hair brushes were added to those previously prepared for toothbrushes. The first commercial manufacturing unit began operations on December 15 and the plant was increased some 25% before it was completed. Extensive tests with hosiery made from nylon thread further demonstrated its superiority over other fibres for the purpose, including natural silk. Nylon is made principally from adipic acid polymerized with hexamethylene diamine.

Vinyon is another synthetic fibre, derived principally from chlorine and acetylene. It is thermoplastic and resists acid and alkali to a marked degree. This has made cloth of this fibre desirable for filtration and other industrial uses. It has also found application with cotton in making the first successful cotton felt.

Ethyl cellulose, another new fibre, made its appearance, and improvements in Fiberglas led to the introduction of colour designs and the adapta-

Upper left: "EXTON" BRISTLES made of nylon replaced hog bristles on many new brushes in 1939

Upper right: A NEW PLASTIC, "Lucite," developed in 1939, enables surgical instruments to shed a shadowless white light

Centre: EXTREME FLEXIBILITY UNDER IMPACT is a characteristic of "Butacite," a plastic layer for safety glass which made its appearance on 1940 motor car models

Lower right: "ZELAN," introduced in 1939, makes gowns treated with it resistant to water and spottings of all kinds

tion of the fabric to table cloths, particularly for restaurants where losses of linen due to stains and burns is considerable. Fiberglass continued its advance as an insulating material and for filter cloths. In the latter case it is sintered to maintain pore size.

Special resins to be used with linseed and soybean oil to produce varnishes equal to those obtained with tung oil were prepared, and other resins for bonding mineral and glass wool came on the market. Pigmented resins in water emulsions made possible improvements in textile printing, and experiments for moulding the fuselage and wing parts of aeroplanes from synthetic resins were undertaken. New plastics were prepared from lignin and from bagasse, notable for their low cost.

Another new resin of considerable importance is polyvinylacetyl known as Butvar or Butacite, depending upon the manufacturer. It is characterized by extreme elasticity and its use has made possible a greatly improved Hitest safety glass.

Staybelite is the name of an improved rosin prepared by hydrogenating a rosin already purified by the use of furfural. It brings to the industry a clear, light coloured rosin of permanent colour.

In the field of metals should be mentioned improvements in stainless steel through alloying a small percentage of silver to increase resistance to the corrosion of sea water. Lead alloyed with steel greatly increases its machineability. Processes for working low grade manganese such as found in Cuba and in the United States became important with the outbreak of the European war. Deposits of tungsten were found in Mexico and are refined at a plant in Texas. A new alloy of tungsten, titanium, and carbon, called "Kennametal" and used principally for cutting tools was introduced. A new plating process for black nickel in which the coating is molybdenum and nickel, was introduced under the name of "Moly-black." Iron of extreme purity is now produced in commercial quantities.

The United States Government undertook intensified search for deposits of minerals usually imported and likely to become scarce if the European war is long continued.

Shrunk glass was made by treating moulded forms with acid, dissolving out approximately 50% of the mass, after which reheating caused nearly 50% shrinkage and produced ware with properties similar to those of fused quartz, but much less expensive.

Work continued with the deposition of very thin films on glass to render it invisible, but it has not yet reached the commercial stage. In the field of pure research may be noted the discovery of new reactions by George Calingaert. By the use of certain catalysts, reactions could be promoted at low temperatures and pressures very much as is the case with inorganic reactions. There is no loss through the formation of by-products or wastes such as accompanies ordinary organic chemical reactions and they are indeed metathetical in character. They have a number of applications, including the study of such complex and puzzling reactions as take place in the aging of wine and liquors.

Heavy carbon was produced in quantity by Harold Urey and associates. Uranium and thorium atoms were split by bombardment with neutrons and enormous amounts of atomic energy were released thereby. Lignin was isolated by F. E. Brauns, and E. Segrè prepared the missing element No. 43 by bombarding molybdenum with deuterons or with neutrons.

A. K. Brewer and A. Bramley developed a new process for the separation of isotopes employing distillation. (See ISOTOPES, SEPARATION OF).

Since the outbreak of the European war 108 technical and chemically pure chemicals, imported prior to September 1, have been made in satisfactory quantity in the United States. A plant was built for the manufacture of synthetic salt cake to supply kraft mills with this raw material. Originally salt cake was a by-product of the old method of manufacturing nitric acid from Chilean nitrate. More recently it has been imported from Europe. Another domestic source is the rayon industry where the sodium sulphate is formed in the acid setting baths. Certain natural deposits are now being worked.

Potash production was expanded in the United States and plans made for the further working of the potash minerals occurring in the Southwest.

By the nitration of paraffin hydrocarbons a new family of chemical compounds was prepared for industry and their commercial production undertaken. These promise much in the way of solvents, gelation agents and other reagents, hundreds of such nitroparaffins being possible.

Wetting agents found additional applications in shampoos and in dentifrices, and Sopanax, an amino derivative, was offered to prevent soap from becoming rancid and discoloured while waiting on the shelf.

Ethylene glycol, heretofore produced by a single manufacturer, now is made by two others in addition.

Santocel is a new form of silica of very low density, used where bulk without material addition to weight is required—as insulation material and for a number of other purposes.

It was found that a good absorptive charcoal can be made from pecan shells.

New processes found employment for the production of new types of aviation gasoline, and at least two new processes went into commercial production for the manufacture of petroleum products more nearly to specifications than have heretofore been possible.

There was considerable expansion in the production of dehydrated castor oil to take the place of Chinawood or tung oil, imports from the Orient having declined substantially because of the war in China. The tung oil groves in the southern part of the United States had larger production than heretofore with more trees reaching the nut bearing stage.

Santomask, a derivative of vanillin, now made in increasing quantities from waste sulphite liquor, was devised to obscure the odour of fresh paint and found approval, particularly for inside work.

Zelan is a new process for so treating textiles as to increase their resistance to water spotting and stains, and synthetic resins were more extensively used for finishing various textile fabrics.

The sink-and-float process, whereby coal can be accurately separated from non-combustible materials mined with it, was installed commercially for the first time.

Reports were made on the application of methods similar to those used in air-conditioning to the curing of tobacco, resulting in lower costs and improved quality.

The paper mill set up in 1938 to manufacture cigarette paper in the United States performed its work satisfactorily and the output was increased. A mixture of flax grown in the different parts of the United States, and harvested primarily for seed, constituted the raw material of such paper, heretofore imported from France.

At Lufkin, Texas, the first paper mill to make newsprint from southern woods was erected.

A rubber filter cloth, desirable in the chemical industry, was produced. Electro-forming, a new process for building up moulds, such as those used in tire manufacture, was announced and an all-glass pump of commercial capacity was put on the market.

Carbon bricks for lining chemical equipment, high pressure valves, and other similar apparatus were improved.

The foregoing items cannot be said to be all inclusive but they at least indicate a very healthy condition of chemistry in the United States. In the last quarter of a century world leadership has been transferred to the U.S. and with it a greater responsibility. (See also CHEMISTRY AND ENGINEERING, AGRICULTURAL, U. S. BUREAU OF; CHEMURGY; INDUSTRIAL RESEARCH; PLASTICS INDUSTRY; VITAMINS.) (H. E. H.)

Chemistry and Engineering, Agricultural,

U. S. Bureau of.

One of the results of reorganization in the U. S. Department of Agriculture in 1939 was the formation of the Bureau of Agricultural Chemistry and Engineering. This bureau includes the chemical and chemical engineering research of the former Bureau of Chemistry and Soils and the research on farm structures, farm mechanical equipment, processing of farm products, rural electrification, and farm operating efficiency of the former Bureau of Agricultural Engineering.

The four regional research laboratories provided for by the 75th Congress, for research on the industrial utilization of farm commodities, and now under construction at Philadelphia, New Orleans, Peoria, and San Francisco, are administered by this new bureau. Because of the frequent, close relations of chemistry and engineering work in agriculture much advantage is expected to result from the integration of research in these two fields.

In addition to work done on regular funds, considerable research was carried on during 1939 with funds provided through the Bankhead-Jones law. In the limited space allotted here it is possible to do little more than list some of the present results attained during the fiscal year ending June 30, 1939.

Ethylene gas was shown to be useful in producing rapid ripening or curing of combine-harvested wheat.

Changes in the apparent quality of eggs were demonstrated to be due in part to handling in the operation of candling and to agitation in transportation, a fact that has a bearing on arguments between shippers and receivers.

Reasons have been found for changes produced in flour by aging, bleaching, and by "bread improvers."

Improvements were made in the process of making starch from sweet potatoes. Material of possible value as an insecticide was found in the fruit of the Amur cork tree; by a new process galacturonic acid, of medicinal value, can be made at 10¢ a gram, whereas the present price is \$2.50 a gram.

Under a patent covering the use of phenothiazine as a urinary disinfectant several licences have been issued to large pharmaceutical houses.

Research on naval stores problems brought a simplified gum-cleaning process and other chemical engineering improvements in this industry, as well as facts of importance to industries using rosin and turpentine.

Investigations of allergens brought out additional facts having a bearing on the sensitivities of people to substances in cotton seed and cotton linters. The antigens in the linters and in the kernel of the seed were shown to be unrelated and it was shown that such substances in the dust from upholstery and furnishings do not all come from cotton linters. It was found that persons sensitive to cottonseed are not affected by refined or refined and hydrogenated cottonseed oil.

Changes brought about in farm practices in growing and harvesting sweet potatoes for starch production are expected to result in greater yields at lower cost, and a process for dehydrating the sweet potatoes for starch gives promise of making starch manufacture from this crop feasible throughout the year.

A new process of making sugar from sorghum may make a new sugar crop available over a wide area, while at the same time new results point to better yields and lower cost in the production of cane sugar.

A method of solvent extraction of tung oil is expected to increase the yield of oil from the nuts.

Protein and nutrition studies showed that the proteins in stored corn meal and soybean meal lose some of their nutritive values, and aging of wheat and corn kernels and soybean seeds resulted in protein changes of less degree.

Improvements were made in the mould-fermentation method in making gluconic acid; new derivatives of fatty acids were developed; varnishes were made from soybean oil and mixed resins as replacements for tung oil in varnish; and laminated paper board was made with the use of soybean meal treated with formaldehyde.

A publication was issued on motor fuels from farm products. Several developments were announced in the field of farm mechanical equipment, including a distributor of poison bait for grasshopper control,

sulphur burner to sterilize soil in greenhouses and mushroom houses, variable-cut toppler for sugar beets which may be useful on beet harvesters, and a combined fertilizer distributor and seed planter.

Studies on cotton ginning brought out possibilities for improvement in such equipment as gin saws, roll hoxes, piping systems, an improved fan and means of using cheaper sources of heat for drying cotton. Reports indicate that 1,100 cotton driers, using the process developed in the bureau, were in operation during 1939.

In the Northwest work was done on flax processing, resulting in the development of a more efficient tow shaker and a better flax deseeding.

Work was started during the year on uses of electricity on the farm and some preliminary results were obtained on the use of electric light traps for the European corn borer.

Chemical engineers of the bureau reported much wider adaptation of dust explosion prevention practices and collaborated in the development of safety codes for fire and explosion protection in country grain handling plants, in plants handling sulphur, and in those manufacturing fertilizers and insecticides. They also showed that static electricity and dirty seed cotton are the chief factors in causing cotton gin fires.

Structural engineers of the bureau announced the possibility that both summer and winter comfort in farmhouses may be brought about by the use of walls permitting maximum ventilation in the outer part and preventing penetration of the air through the inner part. They also brought out new facts on the control of moisture in stored ear corn and small grains, and emphasized the importance of basing ventilation requirements on prevailing local temperatures and humidities. New facts were brought out on crib designs, and two types of portable grain driers have been developed and tested. (See also CELLULOSE PRODUCTS; CHEMISTRY, APPLIED; CHEMURGY; INDUSTRIAL RESEARCH.)

(H. G. K.)

Chemotherapy. As in 1938, so in 1939 sulphanilamide was the chief therapeutic drug of interest. Experimental evidence shows that the product has a chemotherapeutic effect in infections produced by the meningococcus, gonococcus and *Clostridium welchii*, and that it is of value in the treatment of certain diseases of the urinary tract, notably those due to *Bacterium coli* and *Proteus vulgaris*. Some startling reports have been made concerning its value in the treatment of trachoma, a disease long associated with the Indians.

A new derivative, sulphapyridine, made its advent in American clinical circles the early part of 1939. Sulphapyridine has shown itself to be very effective in the treatment of pneumonia—much more so than sulphanilamide. Therapeutic successes have also been reported following the use of sulphapyridine in the treatment of pneumococcal lobar and bronchial pneumonia, gonococcal, staphylococcal, meningococcal, and streptococcal infections. The evidence of its effectiveness is convincing only in respect to its use in pneumococcal infections and in the treatment of gonorrhoea. The drug has toxic reactions and therefore no patients should be treated with it unless arrangements have been made for daily attendance by a competent physician.

Until recently there was no oral bismuth preparation which was effective in the treatment of syphilis. Hanzlik, of Leland Stanford university, made a preliminary announcement in 1936 that a complex preparation formed by the interaction of sodium bismuthate, triisopropanolamine and propylene glycol was sufficiently absorbable to maintain a satisfactory bismuth level in the blood stream. Though it does not displace the intramuscular use of bismuth preparations, it provides a method of treating those patients who may be forced to travel or for whom the intramuscular use of bismuth preparations is interdicted.

Continued interest in the manufacture of insulin led to the development of a purified product which is now being marketed in the form of a solution of zinc insulin crystals. This gives rise to the possibility of ultimately placing the assay of zinc insulin solution on a weight basis rather than relying solely on biological assays.

Testosterone—known as the male sex hormone—has been marketed for a few years in the form of testosterone propionate. The class of female sex hormones, known as estrogens, has opened more promising prospects. The naturally occurring ones are estrone (theelin), estriol (theelol), and estradiol, the last named of which is generally manufactured synthetically. In the hands of competent physicians they have been found to be of benefit in the treatment of certain manifestations associated

with women who are estrin-deficient, particularly during the menopause, and for the treatment of vulvovaginitis in young girls. On the other hand, such potentially active products must receive careful regard by those who are using them. Competent investigators are pointing out the possibility of hazards which may follow the long continued use of these preparations, particularly in persons who may not be estrin-deficient. A rather startling development has been the discovery of certain synthetic preparations, in no way related chemically to the native estrogens (which are generally a cholesterol type of preparation) but which have extremely active estrogenic effect. The best known of these is stilboestrol (diethylstilbestrol—4:4-dihydroxyalpha: beta-diethyl stilbene). Investigations by equally good workers using stilboestrol for treatment of estrogen deficiencies have been inconclusive. All agree that the product is highly estrogenic and has many advantages over native estrogens, particularly as it may be given orally and is much more reasonable in cost. But there is lack of agreement concerning the toxicity of reactions.

Because of the Chinese-Japanese war the supply of ephedrine from China has been greatly curtailed. American pharmaceutical manufacturers have met this shortage by manufacturing a racemic form of ephedrine, called racephedrine, which seems to be equally satisfactory with the official laevo ephedrine except that it must be given in somewhat larger amounts for the same dosage effect.

Intensive research during the summer of 1939 was particularly noticed in the field of vitamin K. Doisy and his associates had confirmed through synthesis the structural formula of vitamin K, demonstrating conclusively that it is 2-methyl-3-phytyl-1,4-naphthoquinone. This work has been further confirmed by that of others. Vitamin K is generally administered in association with bile or bile salts in the treatment of patients suffering from haemorrhagic diseases due to the lack of adequate factors to control the coagulation of the blood. It has also been found that certain closely related synthetic compounds have anti-haemorrhagic properties.

The vitamin B complex has been the most interesting group of the vitamin family. It has been found that nicotinic acid, particularly in association with vitamin B₁, or thiamin chloride as it is better known, is practically specific in the treatment of human pellagra. Manufacturers in the United States have developed vitamin B₆ (pyridoxine hydrochloride), which at the close of 1939 was not yet licensed for sale in interstate commerce. Vitamin B₆ apparently is of some value in certain types of nutritional dermatosis, at least in animals. The most widely used of the vitamin B class of compounds, is thiamin chloride. This vitamin is frequently removed in certain types of milling processes. There have been suggestions made that because of this, the dietary of many Americans may be deficient in thiamin and certain food manufacturers are putting forth efforts for reconstructing certain foods by the addition of this chemotherapeutic agent. (See also PNEUMONIA; UROLOGY; VITAMINS.)

(P. N. L.)

Chemurgy. The application of chemistry to the expanded consumption of farm-grown raw materials for other purposes than food and clothing advanced measurably during 1939. Plant capacity for processing soybeans increased several million bushels. The first large-scale mill to utilize Southern pine for newsprint was completed in December at Herty, Texas, with an investment of more than \$6,000,000, and its output contracted for in advance. A privately financed sweet potato starch factory began operation at St. Francisville, La.

Under construction and to be completed during 1940 were the four regional research laboratories for which Congress has appropriated approximately \$4,000,000 a year to seek industrial and non-food uses for surplus farm products. The sites, areas, and

products to be studied are as follows:

Peoria, Ill., for the Northern area including Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, Ohio, Wisconsin, and Michigan. Corn, wheat, and agricultural wastes will be the principal research subjects.

New Orleans, La., for the Southern area including Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, Oklahoma, South Carolina, and Texas. The principal products to be studied here are cotton, sweet potatoes, and peanuts.

Philadelphia vicinity for the Eastern area, including the New England and Atlantic States with North Carolina, Tennessee, Kentucky, and West Virginia. Tobacco, apples, potatoes, milk, and vegetables to be studied.

San Francisco vicinity for the Western area, including Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. Studies to centre on fruits, vegetables, potatoes, wheat, and alfalfa.

The chemurgic program may briefly be described. Although agriculture is primarily a food-producing enterprise, the inelasticity of the human stomach definitely limits the market for food products. The loss of export markets and other factors resulted in agriculture being confronted with a capacity for production greater than its ability to sell.

Aware of the fast-growing science of organic chemistry and its ability to convert organic materials into substances in wide demand, a few students of the agricultural situation began several years ago to hope that chemistry might eventually produce important markets for farm materials.

The first proposals for serious consideration of the idea were made on the editorial page of *Farm & Fireside* in 1926. It was pointed out that farmers are producers of starch, sugar, proteins, cellulose, vegetable oils, and other items which are raw materials for the organic chemist, and that industry might find in the annually renewable gifts of the soil its most favourable supplies of raw materials.

The term chemurgy was first applied in 1935, when it was coined by Dr. William J. Hale, an organic chemist. Dr. Hale pointed out that except for a 2% or 3% content of minerals actually extracted from the soil, all plant growth is simply moist air transformed by sunshine into solid substance; and that, therefore, wealth-producing potentialities are virtually unlimited, in addition to being independent of the irreplaceable characteristics of mineral deposits.

While few of chemurgy's proponents have ever maintained that it was more than one sound approach to the agricultural problem which obviously would advance slowly, developments during 1939 appeared to indicate that it may have a large share in the eventual enlargement of agricultural income.

The basic idea of chemurgy is to advance the utilization of farm materials in industry, mainly for inedible and non-wearable consumption, through (a) new uses for present crops; (b) new crops for new or established uses, and (c) profitable markets for wastes.

The tonnage of non-marketable farm wastes grown each year has been estimated to equal the quantity of products that are sold. The weight of fodder and straw is as great as that of salable corn and cereal grains. Other wastes are cotton stalks, cull fruits and vegetables, poultry feathers, nut shells, and others of minor importance.

Announcements were made during 1939 of the appointments of official State Chemurgic Commissions by the governors of Ohio and Missouri. The Commissions are charged to study the utilization within their respective States of agricultural materials for other than food purposes, to discover opportunities for enlarged farm production in such directions, and to recommend constructive steps to the State Governments. Similar commissions under other names exist in Arkansas, Mississippi and Vermont.

Three State Teachers' colleges in Texas and Centenary college at Shreveport, La., established study and laboratory courses in chemurgy during 1939. As a laboratory exercise an issue of the school newspaper at Sam Houston State Teachers' college, Hunts-

ville, Texas, was printed on paper made by students from fibre of castor bean stalks.

A feature of 1939 was the 80,000,000bu. crop of soybeans (up from 57,000,000bu. in 1938) which again moved into markets at prices more satisfactory to farmers than those brought by any other major crop. Increasing quantities were consumed in paints, plastics, and for other industrial uses.

The successful expansion of soybeans strengthened the demand of farmers and chemurgic leaders that research looking to further new crops be accelerated. The fact that the soybean industry is largely a growth of the last 20 years gave emphasis to the belief that other new crops could advantageously be added to the agricultural economy and substituted on acreages now contributing to surpluses of the older staples. The annual importation of 2,000,000,000lb. of oils and fats was suggested to indicate one of several opportunities for farmers to produce for markets already established in the United States. Shortages of many materials for which normal shipping conditions were dislocated by wars abroad sharpened interest on the part of manufacturers in domestic farm sources of supply.

Research into the practicability of alcohol from farm-grown materials as a supplement to motor fuels made slight progress during 1939. Business difficulties and lack of funds closed down the experimental plant at Atchison, Kan. Further research is anticipated in this field, as well as into starch engines, and other approaches to a fuel market for farmers are expected when the regional laboratory at Peoria is opened.

Newly exhibited during the year were a fast-drying paint made from dehydrated castor oil, and fabrics made from both soybeans and casein. The casein fabrics are efforts to improve upon processes lately developed in Italy where the wool shortage has encouraged the use of substitutes. The protein of soybeans is used, in a process similar to rayon manufacture, to make a yarn that resembles wool.

Increased quantities of soybean materials were consumed in automobile parts, plastics, paints, enamels, stearic acid, glycerin, forleathin, and in foundry cores. The largest tonnage increase for domestic consumption, however, was probably for a food use in vegetable shortenings. A heavy export demand developed in the last quarter of 1939. Plastic, paint, and numerous other further uses were studied in several industrial laboratories and at the U.S. Soybean Industrial Products Laboratory at Urbana, Ill.

Chemists displayed marked interest in castor oil which, due to a unique quality of molecular structure, is believed to have an important industrial future. Farmers in several States, notably in Texas, planted test acreages of castor beans, with results generally indicating an agriculturally profitable crop.¹ Further investigations of the castor bean stalks fibre were conducted, and also of ricinine, an element in the plant which is toxic to insects.

Opening in September at Brevard, N.C., was a large plant which is manufacturing cigarette paper at the rate of a carload and a half per day. This was formerly a French industry. The North Carolina factory employs 700 persons. The raw material used is flax fibre, the product of the Imperial valley in California being blended with other fibre grown in southern Minnesota.

Growing recognition of the popular appeal of chemurgy appeared when the State fair organizations of Ohio and Texas set aside large display areas for exhibits of products manufactured from farm raw materials. Smaller displays attracted attention at other State fairs, county fairs and Grange meetings.

Of promise for the future was the experimental development during 1939 of plastic materials in large sheets. Hitherto satisfactory plastics have been made only in single pieces of relatively small size. During the year 1939 plastic automobile body parts

¹Preliminary experiments with harvesting machinery.

and aeroplane fuselages have proved successful in preliminary tests. Advances toward plastics of lignin, which comprises 25% of all woody plants as the "cement" between cellulose cells and has been wholly a waste, were recorded in laboratories. (See also CHEMISTRY, APPLIED; PLASTICS INDUSTRY.)

The headquarters of the National Farm Chemurgic Council, Inc., the organization devoted to furthering chemurgy in the United States, are at 50 West Broad Tower, Columbus, Ohio.

Hale, *Prosperity Beckons* and *The Farm Chemurgic*; Christy Borth, *Pioneers of Plenty*; Senate Document, No. 65. (W. McM.)

Chess. Chess moved its scene of battle because of the war in Europe to South America and Russia, aside from several important tourneys staged in the United States. The International Chess Federation championship in Buenos Aires was formally opened by President Ortiz, of Argentina, surrounded by his cabinet and diplomatic corps. Playing for the Hamilton-Russell trophy, emblematic of the world's championship, the absence of the United States team, three-time winners, brought in Germany as the winner; Poland second, and Estonia third. Capablanca, playing for Cuba without losing a game, won the gold medal for his record of six wins and five draws in the final.

For the championship of the U.S.S.R., Mikhail Botvinnik regained his title during a remarkable display of skill and stamina against 17 of the Soviet Union's strongest masters, defeating Komsomol Kotov, recognized as the master of the Russians. In the great Russian Master's Training tournament begun in Leningrad and finished in Moscow, Salo Flohr, of Czechoslovakia, captured the first prize by one and a half points ahead of Samuel Reshevsky, the United States champion. Dr. Max Euwe won the British Chess Federation tournament at Bournemouth, England, clinching first place in the last round without risking a solitary move.

The North American championship for 1939 drew 28 entrants, with the crown going to Reuben Fine with a superior mixture of wins and draws, leaving behind him S. Reshevsky and I. Horowitz. This was the 40th annual tourney, held under the auspices of the American Chess Federation. In capturing this title, Fine added to his glamorous victories in 1932, 1933, and 1935, besides sharing the crown with Reshevsky in 1934. Arnold Denker won a hard fought last round draw from Albert S. Pinkus in the New York State championship tourney, enabling him to repeat his title-taking conquest of 1938. The two important New York tourneys: the Marshall Chess club won the championship of the New York Metropolitan Chess League, defeating the Manhattan Chess club. For the championship of the Marshall Chess club there was a tie for first place between Sidney Bernstein and Milton Hanauer, both recognized as among the best players in the United States. A bounteous harvest of exciting chess was produced by the Ventnor City, (N.J.) invitation chess tournament, as 12 well-chosen competitors squared off. After an uphill struggle, Milton L. Hanauer topped the list with the best total score. In the Intercollegiate Chess League the contest was especially close, with City college clinching premier honours on the last day of the tournament. In the Yale-Harvard-Princeton-Dartmouth group, Harvard made a clean sweep, winning possession of the Belden-Stephens trophy.

The City of Boston title was won by Weaver W. Adams, giving him two legs on the George Sturgis cup. Of prime interest to chess players is the merger of the National Chess Federation and the American Chess Federation, forming the United States of America Chess Federation, of which George Sturgis is the first president. (J. B. P.)

Chicago, American city, port of entry, county seat of Cook county, Ill., is situated at the south-west corner of Lake Michigan. It is the second city of the United States in population, manufactures, and volume of trade. It is the largest centre of rail traffic and of air traffic and is a port for a great tonnage conveyed by lake ships, principally bulk cargoes of iron ores, fuel, and blast furnace flux. It has access by the Illinois waterway to the inland navigation routes of the Mississippi valley. Small steamers make direct ocean voyages to and from Chicago via the St. Lawrence river and the Welland canal.

The population of the city proper at the last Federal census was 3,376,438 inhabitants; that of the entire metropolitan area (1,119.29 sq.mi.) 4,364,755.

Chicago enjoyed a general improvement of business in 1939, the most marked feature of which was the long-delayed revival of the building industries. Lagging far behind most other American cities in 1938, Chicago's 1939 gains were outstanding. Total construction in the metropolitan area was close to \$160,000,000 in value. Residential building valued at more than \$60,000,000 was more than double that of 1938.

Building in the suburbs far outpaced building within the corporate limits of Chicago. Because of the demolition of buildings in the "blighted areas" adjacent to the downtown business centre of Chicago, more buildings were razed than were built in the city in the ten years after 1929, the city suffering a net loss of 9,300 structures.

The year 1939 was the first in which the number of structures erected exceeded the number of those torn down. Some buildings demolished were large commercial structures which included the first steel frame buildings ever erected. They were wrecked because of obsolescence that made it impossible to meet the higher taxes. But in 1939 the famous Masonic Temple building, once the highest office building in the world, was taken down because of the expense that would have been incurred in order to adapt its foundations to conditions created by the boring of the new State street subway. As a result of all these demolitions the number of motor parking lots has increased so that the central part of Chicago has taken on a new aspect, with some buildings mere islands surrounded by streets and parked automobiles.

At the end of 1939, 2.7mi. of the new subway system had been excavated—35% of the 7.7mi. now under construction. Plans call for the operation of trains by Jan. 1, 1941, but in the meantime negotiations for the co-ordination of existing surface, elevated, and motor transit lines have bogged down and the courts have been helpless to untangle the skein of conflicting interests.

Chicago's 1940 budget called for total appropriations of \$164,844,502 for the city government including \$70,706,560 for schools, and appropriations for parks and sanitation under the jurisdiction of independent administrative bodies.

Despite business improvement, the burden of unemployment remained heavy in 1939, and there were periods of critical distress among families dependent upon public relief. The number of persons dependent on locally financed relief declined from 269,019 in June to 229,305 in November as a result of more employment.

Mayor Edward J. Kelly, Democrat, was elected to a third term as mayor in the municipal election of April 4. It is his second elective term, he having been chosen by the city council to fill the vacancy caused by the assassination of Mayor Anton J. Cermak in 1933. Mayor Kelly polled 822,469 votes to 638,068 for his Republican opponent, Dwight H. Green, former U.S. District Attorney, who convicted Alphonse Capone of income tax evasion. In the preceding municipal primary election on February 28, Mayor Kelly polled 604,190 votes for the Democratic nomination to 317,054 by his opponent, State's Attorney Thomas J. Courtney. In the Republican municipal primary of the same date, Dwight

H. Green polled 212,011 votes to 62,540 received by his opponent, former mayor William Hale Thompson.

During the year, State's Attorney Thomas J. Courtney made progress in the effort to curb crime, sending 1,024 criminal defendants to State prisons, 442 to county and city prisons, and placing 339 on probation. Three were executed.

Convictions in burglary cases tried were secured in 93% of the cases, and in 91% of armed robbery cases, with the following percentages for other classes of crime:—embezzlement, 94; manslaughter, 57; sex offences, 73; murder, 74; receiving stolen property, 83. Convictions in jury trials amounted to 51%, in non-jury trials 87%.

During 1939, 15 indictments were obtained against officials charged with election frauds, and a member of the City Council, Frank E. Konkowski, was convicted of the "sale" of a position on the police force.

In the municipal courts, however, efforts to curb public gambling did not meet with similar success and only 12 persons out of 7,400 arrested on charges of public gaming were convicted. The total number of persons charged with offences other than violations of traffic rules, in the municipal courts, dropped from 31,699 in 1938 to 21,623 in 1939.

The year in Chicago was marked by investigations of the Department of Justice into charges of income tax evasion by persons reputed to be in receipt of huge incomes from gambling enterprises. Several indictments were returned.

Charges made against two judges of the municipal court were under investigation by the Chicago Bar Association at the end of the year. Only one spectacular "gang killing" occurred in 1939, the unsolved murder of Edward J. O'Hare, president of a race track and associate of many characters prominent in the gang wars of the prohibition era. (L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill., founded in 1890. Privately endowed, the university is co-educational and non-sectarian, although not less than three-fifths of its trustees must be members of Christian churches, and a majority of the three-fifths must be members of Baptist churches.

During the summer quarter, 1939, 4,098 students were enrolled in the university, of whom 2,063 were men and 2,035 were women. The total enrolment for the academic year 1938-39 was 12,520, which was an increase of 800 over the previous year. The Home Study (correspondence) department had an average enrolment of 3,684, which is exclusive of the totals given above. The university granted 1,768 degrees during the academic year; 497 were Master's degrees and 178 were Doctorates of Philosophy.

The total funds held by the university as of June 30, 1939, amounted to \$125,835,441, a decrease of \$410,923 over the same figure for the same date in 1938. These funds were divided as follows: Endowment, \$70,944,248; plant, \$44,436,453; other funds, \$10,454,740.

The total income of the several divisions of the budget was \$8,375,444, an increase over the income of the previous fiscal year of \$160,428. This total of budget income does not include income of auxiliary enterprises such as residence halls, commons, bookstores, and student social facilities, nor restricted expendable gifts. Including such income, the total current income for 1938-39 was \$10,567,953.

The total amount of gifts paid in was \$1,308,672.

The libraries added approximately 39,000 volumes raising the total to 1,271,296. President, Robert Maynard Hutchins, LL.D.

Chicago Subway: see CHICAGO; ELECTRIC TRANSPORTATION: *Rapid Transit.*

Child Labour. The year 1939 was the first full year during which the Fair Labor Standards Act of 1938 was in effect¹ in the United States. This act, by establishing nation-wide standards higher than those operative under most State child-labour laws, marks a very significant advance in the protection of children from industrial exploitation. It establishes, for the employment of children and young persons in industries producing goods for interstate or foreign commerce, a basic 16-year minimum age, allowing limited employment of children between 14 and 16 years only in non-manufacturing and non-mining occupations if and to the extent such occupations have been determined by the Chief of the Children's Bureau not to interfere with their schooling, health, and well-being. In addition, it establishes an 18-year minimum age for work in occupations which may be found and declared by the Chief of the Children's Bureau to be particularly hazardous or detrimental to health or well-being. It also sets minimum wages and maximum hours for all workers, regardless of age, in industries producing goods for shipment in interstate or foreign commerce or engaged in such commerce.

The administration of the child-labour provisions of the act, which is placed in the Children's Bureau of the U.S. Department of Labor, has been based on a policy of establishing co-operative relationships with the agencies in the States administering State child-labour laws and of strengthening State administrative systems. The act made this possible by providing for the utilization, with their consent and co-operation, of the services of State and local agencies administering State labour laws, and by recognizing a certificate of age issued according to regulations prescribed by the Children's Bureau as evidence that the minor is of legal age for employment. The wide use of employment certificates in the States as a fundamental procedure for the enforcement of State child-labour laws made it possible in most States to accept State employment certificates as evidence of age of minors under the Federal Act, through co-operative agreements which in many cases resulted in the raising of State standards. Thus, the setting up of dual systems of administration by State and Federal Governments has been avoided and a foundation has been laid for a more effective attack on child-labour problems throughout the United States than has ever before been possible.

Following the ratification by Congress in 1938 of the International Labour Organization convention fixing a minimum age of 15 years for employment at sea, a bill drafted to implement this convention was introduced in the Senate on Aug. 5, 1939. This bill sets for employment on American vessels a general 16-year minimum age, an 18-year minimum age in the more hazardous types of employment at sea, and makes provisions for administration through the requirement of proof of age.

Advances were made in child-labour legislation in a number of the 44 States whose legislatures met in regular session. Two States (West Virginia and Massachusetts) and Hawaii and Alaska adopted a basic 16-year minimum age, the application of the law in Alaska being restricted to girls. Legislation improving hours-of-labour standards for young persons was passed in West Virginia, Massachusetts, Hawaii, and Alaska. Other new State and Territorial laws strengthened the legal provisions for employment-certificate issuance, for compulsory school attendance, for the work of children in street trades and in industrial home work, regulated wages of women and minors, and made provision for the development of apprenticeships. By 1939, 12 of the 48 States of the United States had established 16 years as the basic minimum age for employment: Ohio and Montana more than 20 years ago; Wisconsin and Utah in 1933; Connecticut and Pennsylvania in 1935; Rhode Island and New York in 1936; North Carolina and South Carolina in 1937; and Massachusetts and West Virginia in

¹Act approved June 25, 1938; effective Oct. 24, 1938.

1939. In all these States except Rhode Island the legal minimum age had previously been 14 years. There has been no addition in recent years to the very small group—California, Maine, Michigan, and Texas—which for some years has had a 15-year minimum age.

Current figures are not available for the nation as a whole as to the number of working children under 16 years of age. The last census (1930) showed somewhat less than 200,000 employed in non-agricultural occupations and somewhat more than 450,000 in agriculture. These figures represent a decline of 67% in agricultural child labour and 65% in non-agricultural child labour since 1910. Available figures indicate that this decline has continued since 1930.

The last report of the British Ministry of Labour, May 1939,¹ gives the estimated number of boys and girls under 16 years of age, insured under the Unemployment Insurance Acts, who were employed in Great Britain in 1938 in occupations other than agriculture, as 469,000 boys and 386,000 girls, or a total of 855,000. This is less than in 1937 (896,000) and in 1936 (930,000). Of the number estimated for 1938, 229,420 were employed in the distributive trades alone, 45,930 in the textile trades, and 29,640 in coal mining. A departmental committee reporting in 1937 on employment of young persons under 18 in unregulated occupations, outside of agriculture and domestic service, estimated at least 125,000 in such occupations.²

Legislation restricting hours of labour of young persons, becoming effective in Great Britain in 1939, has materially raised the standards for young workers. The Factories Act (1937), effective July 1, 1939, reduced the hours of work of young persons 16 and 17 years of age in factories to 48 a week, and for those under 16 to 44 a week. The Young Persons (Employment) Act (1938), which became effective on Jan. 1, 1939, regulated hours of employment of young workers under 18 in a range of occupations previously not covered by legislation, including the collection and delivery of goods and employment in messenger service in connection with hotels, clubs, newspaper publishing plants, places of amusement, and other establishments. The maximum work week is set at 48 hours for young persons under 18 (44 hours for those under 16 after Jan. 1, 1940), and provision is made for rest periods and a weekly half holiday. The Shops Act (1912 to 1936) was also amended in 1938, providing that beginning Jan. 1, 1940 working hours of children under 16 in shops are to be reduced to 44 a week, subject only to averaging of hours during the Christmas fortnight. The Education Act (1936), which raised the school-leaving age from 14 to 15 years, would have gone into effect Sept. 1, 1939, but its operation has been suspended by an emergency bill passed by Parliament Oct. 10, 1939. This bill was reluctantly agreed to as necessary by members of all parties in view of the evacuation of school children from the cities because of war conditions. (B. Mc.)

Children's Books. Biography for children and young people ranked high in the 1939 output. Most prominent was *Daniel Boone*, brief, virile text with magnificent illustrations by the author-artist James Daugherty. Another important pictured biography was *Abraham Lincoln*, by Ingri and Edgar Parin d'Aulaire. Others were: *Enchanting Jenny Lind*, by Laura Benet; *Drina: England's Young Victoria*, by Marion W. Flexner; *Washington and the Lafayettes*, by Frank and Cortelle Hutchins; *The Treasure Hunter* (Robert Louis Stevenson), by Isabel Proudfit; and *Runner of the Mountain Tops* (Louis Agassiz), by Mabel L. Robinson. Among picture books *Little Toot*, a comic story of a bold little tugboat, by

Hardie Gramatky, won loud acclaim. Others were: *Cock-A-Doodle-Do*, by Berta and Elmer Hader; *Madeline*, by Ludwig Bemelmans; *The Happy Flute*, a Hindu St. Francis story, by Sant Ram Mandel with pictures by Dorothy Lathrop; *Lucio and His Nuong*, by Lucy Crockett.

Several classics for little children were given new life. John Bunyan's *Pilgrim's Progress* as retold many years ago by Mary Godolphin was brought out in distinguished format with pictures by Robert Lawson. Andersen's *The Little Mermaid* was published separately with charming illustrations by Dorothy Lathrop. A third attractive new edition was *Twenty Jataka Tales* retold by Noor Inayat and illustrated by H. Willebeek le Mair.

Fiction included among many others *Skippack School*, by Marguerite d'Angeli; *Peter Hale*, by Julia Davis; *Cinders*, by Katherine Gibson; *Little Grey Gown*, by Mabel Leigh Hunt; *Columbus Sails*, by Walter C. Hodges; *Ocean-Born Mary*, by Lois Lenski; *Boy With a Pack*, by Stephen Meader; *Runaway Prentice*, by Ethel Parton; *The Singing Tree*, by Kate Seredy; and *Bright Morning*, by Charlie May Simon.

Several adult writers entered the field for the first time. Kay Boyle's *Youngest Camel* was well reviewed. Gertrude Stein's *The World is Round* aroused considerable discussion as a new form of writing for children. Somerset Maugham's *Princess September and the Nightingale* was a reprint of a Siamese fairy tale from an earlier volume of travel sketches. Illustrations by Richard C. Jones, brilliant in colour and delicately humorous in design, make it one of the most decorative picture books of the year. *My Roads to Childhood*, by Anne Carroll Moore was important as literary criticism and inspirational reading. This volume includes a revision of her reviews and comments on children's books and reading published earlier in her Roads to Childhood series and her reactions to current books for children and young people.

Books of information were many and covered widely diverse subjects. Increased use of photographic illustrations added greatly to their attractiveness and accuracy. Representative titles were: *Machines and the Men Who Made the World of Industry*, by Gertrude Hartman; *America's Treasures* (underground resources), by W. Maxwell Reed; *Here Comes the Mail*, by Robert Disraeli; *Boys' Book of Insects* and *Boys' Book of Photography*, by Edwin Teale; *Heroes on Your Stamps*, by John Gregory. *Fair Play*, by Munro Leaf, is intended to suggest ideals of good citizenship to little children by means of comical pictures and brief arresting text.

The John Newbery Medal was awarded in June to Elizabeth Enright for her *Thimble Summer*. The Randolph Caldecott Medal was won by Thomas Handforth, artist-author, with his *Mei Li*. (See also LITERARY PRIZES; PUBLISHING.) (E. L. P.)

Children's Bureau, United States: see CHILD LABOUR; CHILD WELFARE; JUVENILE DELINQUENCY.

Child Welfare. The disturbed political situation in Europe in 1939 left its mark on child-welfare work in many parts of the world. The expectation of war and the war itself brought about a diversion to other uses of resources which in normal times would have been devoted to the improvement of the situation of children. Most of the European child-welfare legislation in 1939 was aimed at increasing the population. Various measures to this end were prescribed.

In France, under the decree of July 29, 1939, premiums of not less than 2,000 francs will be paid under specified conditions to the mother on the birth of the first viable and legitimate child in the family. Supervision will be maintained to assure the use of the premium for the child's benefit. Family allowances for dependent children, previously paid to limited categories of work-

¹Ministry of Labour Report for the year 1938. Appendix XV, p. 107. London, May 1939.
²Report of the Departmental Committee on the Hours of Employment of Young Persons in Certain Unregulated Occupations, p. 11, London, March 1937.

ers, were extended to practically all persons working for a living, including employers. Persons not receiving family allowances who have permanent charge of one or more children and who lack the necessary resources are entitled to "family aid" varying from 25 to 50 francs monthly for each child. Loans from 5,000 to 20,000 francs are to be made to young persons who intend to be married and to settle in rural districts. The debt is to be cancelled gradually upon the birth of children. The departments (territorial subdivisions of France) were ordered to take measures for the prevention of infant mortality; regulations in regard to maternity homes, abortions, and the care of children born out of wedlock are also prescribed in the decree.

In Denmark a new law requires the establishment throughout the country of offices where expectant mothers and recently confined mothers may receive medical treatment and economic and legal aid.

In Italy the system of compulsory maternity insurance in existence since 1910, under which employed women with a monthly income below 800 lire were insured in their own right and were receiving a specified sum at the time of childbirth, was replaced in 1939 by compulsory insurance "for the promotion of marriage and an increase in the birth rate." Under the new law, which applies only to Italian citizens who are Aryans, insurance is required of all workers with a monthly income below 1,500 lire and the insured persons are paid at the time of their marriage a premium varying from 400 to 1,000 lire according to sex and occupation, provided they are below a specified age. Premiums varying from 150 to 400 lire, according to the parents' occupation and the order of the child's birth, are also paid at the time of a child's birth.

Teaching of child care was introduced by law in Italy in high schools, normal schools, and various vocational schools, including conservatories of music and art schools. The teachers, who must be physicians, are to be paid by the National Government.

The Advisory Committee on Social Questions of the League of Nations held its annual meeting in Geneva from June 19 to July 1, 1939. Twenty nations, including the United States, were represented. Among the special subjects for discussion were the following studies now being made by the committee: Training of persons engaged in social work; social position of the unmarried mother and her child; principles adopted in the administration and organization of welfare work for children; and the problems involved in family desertion.

A new problem in work for children was presented by the large number of refugees. About 500,000 Spaniards—men, women, and children—fled into France early in 1939 following the surrender of the Spanish Loyalist Government. Some of the refugees later went to various Latin-American countries; some returned to Spain; but about 250,000 Spaniards were still in France in July 1939. The responsibility for their care was placed by the Government on the Ministry of the Interior and the departments. The funds granted by the French Government were insufficient and were being supplemented by private gifts of money, clothing, and other necessities. Most of the refugees stayed in camps maintained either by the Government or by private national and international organizations. Some of the children were absorbed in French families.

There were also large numbers of refugee children from Germany and the territories annexed by Germany. These children have been admitted to other European countries, particularly England, France, Holland, and Switzerland. In some of these countries admission is temporary, pending re-emigration. Large numbers of these children have been cared for by private agencies in special institutions or camps with a varying amount of Government supervision. Many children have been taken into private

homes, particularly in England and France. The work for refugee children has been greatly hampered by insufficient funds.

The situation of children in Europe was affected also by the outbreak of war in Europe in Sept. 1939. The shortage of labour due to the military service of large numbers of men and the resulting demand for child workers brought about a suspension of the child-protection laws in some countries. In Germany the National Defence Council issued an order on Sept. 1, 1939, permitting the suspension of labour laws including those relating to the minimum age of admission to employment, hours of work, and night work. In France a decree, also of Sept. 1, 1939, permits the employment of children 14 years of age for 10 hours a day or 60 hours a week, instead of 40 hours as previously; these hours may be prolonged upon permission from a labour inspector. In Belgium the suspension of specified provisions of the child-labour law was permitted by decree of Aug. 26, 1939, in case of re-enforcement or mobilization of the army. In Great Britain the school-leaving age was to have been raised from 14 to 15 years on Sept. 1, 1939, in accordance with a law passed in 1936. Because of war conditions the coming into effect of these provisions was postponed indefinitely.

Among the important developments in Latin America in 1939 were the enactment of a general labour law in Bolivia, prescribing a minimum age of 14 years for employment; prohibiting night work and dangerous, unhealthful, or strenuous work for children under 18; and prescribing a 40-hour week for children under 18. In Colombia regulations were issued defining the functions of the Bureau of Maternal and Child Welfare to be created under the National Department of Labour, Health, and Social Welfare. In Venezuela a children's code was promulgated and the National Child Welfare Council, the social agency in charge of child-welfare work established in 1936, was reorganized for the purpose of making its work more effective. The Eighth Pan American Child Congress, which was to have been held in Costa Rica in October, was indefinitely postponed because of the war in Europe.

In Argentina the National Committee on Aid to School Children completed the first year of its functioning; 670,000 articles of clothing were distributed and school feedings were introduced in 594 localities. A daily average of 74,600 children thus received aid in food and clothing.

In the United States, the Federal-State programs for maternal and child-health services, crippled children's services, and child-welfare services administered by the Children's Bureau, U.S. Department of Labor, under the Social Security Act were expanded in 1939. Amendments to the Social Security Act increased the amounts authorized for annual Federal grants-in-aid to the States for all three programs and made Puerto Rico eligible to receive this aid beginning Jan. 1, 1940. For maternal and child-health services, the amount authorized for annual grants to the States was increased from \$3,800,000 to \$5,820,000. For the fiscal year ending June 30, 1940, the amount appropriated was \$4,800,000, part of which will be used for extending, on an experimental basis, programs for medical care for mothers and children. During the year, State and local health agencies, with this Federal aid, extended and improved their maternal and child-health programs, especially in rural areas. For crippled children's services, the amount authorized for annual grants to the States was increased from \$2,850,000 to \$3,870,000. The additional crippled children's funds are to be allotted to the States on the basis of need and do not have to be matched by the States. Approximately half the increase authorized was included in the amount appropriated for the year ending June 30, 1940. Part of the additional funds will be used by the State crippled children's agencies for the care of children suffering from rheumatic heart disease—children who, for the most part, have not been reached by the

program heretofore. For child-welfare services, the amount authorized for annual grants to the States was increased from \$1,500,000 to \$1,510,000 to cover, in part, the grant for Puerto Rico. Under the administration of State welfare agencies a total of 459 child-welfare workers were employed during the year with Federal, State, and local funds in covering 478 rural counties and local areas with intensive case-work services for children and 690 local areas with more scattered service.

Other amendments to the Social Security Act increased the Federal contribution toward aid to needy dependent children, administered by the Social Security Board under the Social Security Act, and provided survivors' benefits for children of deceased persons covered under the old-age insurance provisions of the act. (See SOCIAL SECURITY.)

The Children's Bureau of the United States Department of Labor continued its activities in research, in assembling current child-welfare statistics, and in the dissemination of technical and popular information relating to the health and welfare of children. Advisory service given to State health, welfare, and labour agencies, is an important part of the administration of Federal grants to the States for maternal and child-welfare services under the Social Security Act and of the administration of the child-labour provisions of the Fair Labor Standards Act.

The widespread attention being given to better care for mothers and babies was reflected in improved mortality rates. The maternal mortality rate for 1938 was 44 deaths of mothers per 10,000 live births, showing a 10% decrease from the rate of the preceding year (49). The infant mortality rate was 51 deaths of infants per 1,000 live births as compared with 54 in 1937. The 1938 birth rate for the United States was 17.6 per 1,000 population, the highest rate recorded since 1931.

The national health program including proposals for an expanding Federal-State program for medical care for mothers and children was submitted to Congress by the President in Jan. 1939. A bill based on the proposed health program was introduced in the Senate, committee hearings were held, and the bill was held over for further consideration during the next regular session of Congress beginning in Jan. 1940. During 1939 several of the States in the United States improved their laws relating to child adoption, to children born out of wedlock, to administrative organization of services for children, and to the supervision of children's institutions and child-placing agencies.

Realization is growing in the United States that, despite advances made, many children cannot be given adequate food and care because of family poverty and many community services for children are available in only a limited number of communities.

On April 26, 1939, the first session of the fourth national conference on child welfare called under Presidential auspices was held in Washington, D.C. The earlier conferences were held in 1909, 1919, and 1930. The fourth conference, the White House Conference on Children in a Democracy, held its second session Jan. 18-20, 1940. It considered a report summarizing child-welfare gains made since 1930, outlining objectives to be sought for children in a democracy, and proposing advances to be made during the next 10 years. (See also CHILD LABOUR; INFANT MORTALITY; SOCIAL SECURITY.) (K. F. L.)

Chile, a republic on the west coast of South America; language, Spanish; capital, Santiago; president, Pedro Aguirre Cerda; area, 289,776 square miles. The country itself is 2,800 mi. in length (from the tropical north to the sub-arctic south) and is nowhere more than 200 mi. in breadth. The population is officially estimated at 4,634,839 (Dec. 31, 1938). Chile has more North European elements in its population than any other Hispanic-American country, with German-Chileans preponderant in some

sections. The Indian population is estimated at 100,000. The chief cities (Jan. 1, 1939 est.) are: Santiago, 859,830; Valparaíso, the principal port, 263,228; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, resort and suburb to Valparaíso, 49,488; Iquique, 46,458; Talca, 45,020; Chillán, 39,511; Temuco, 35,748; Valdivia, 34,296; Talcahuano, 27,594; and Punta Arenas, southernmost city in the world, 24,307.

History.—The year 1939 was marked initially by the attempts at reform undertaken by the new Popular Front administration of President Aguirre Cerda (inaugurated on Dec. 24, 1938) and bitter conservative resistance. On January 12 the Government announced a vast nationwide public works program to cost 500,000,000 pesos (approximately \$20,000,000) annually, including housing, social security, increase of production, and improvement of education. Political considerations were temporarily shelved, however, when on the evening of January 24, an earthquake regarded as the most devastating ever recorded in America, shook the country from Iquique to Puerto Montt. The region to the south of Santiago, especially an area of nearly 50,000 sq. mi. around Chillán, and Concepción, with around 1,600,000 inhabitants, was the hardest hit. The death toll alone was estimated by competent observers to be in the neighbourhood of 50,000, with the most conservative figures 30,000. At least an equal number were injured. The city of Chillán was practically razed, and a majority of the buildings in Concepción, Talcahuano, Cauquenes, and other important cities destroyed, with a property loss of hundreds of millions of dollars. Relief was rushed from all parts of America. United States Army bombers brought medical supplies, while the British cruisers "Ajax" and "Exeter," then at Valparaíso, converted themselves into transports to carry supplies, as all rail communication was disrupted. The Government conscripted all able-bodied men between 18 and 45 in the stricken area to clear the debris. Over 300,000 persons were inoculated against typhoid to prevent the spread of disease, and in March 700,000 persons were reported still homeless. President Aguirre, after a personal inspection of the stricken area, asked congressional authorization for creation of a 2,500,000,000 peso (about \$80,000,000) fund for the joint purpose of relief and rehabilitation and for general reconstruction of the country economically. This sum, one and one-half times the annual budget, was to be raised by foreign loans and increased taxes. After protracted debate and bitter conservative opposition, Congress approved the measure (April 29).

Throughout the year the Aguirre Cerda administration was faced with opposition to its program from some of the component parties of the Popular Front as well as from the conservative elements. On January 13 retail bakers in Santiago organized a public demonstration against Government action in cutting the price of bread. That this and other early measures met approval was manifested, however, in the support given in by-elections in the same month. In April, Army officers were forbidden to support or join any political group. Meanwhile, in March, the Popular Socialist Vanguard (the renovated "Nacista" party of 1938) and a new Fusion party under former dictator-president General Carlos Ibáñez announced support of the Government. During May action of the minister of the interior in temporarily barring a Conservative newspaper from the mails attracted wide attention and brought about his suspension from office. Exposure of an alleged revolutionary plot to overthrow the Government through a boycott system late in the same month, was followed in August by an attempted coup d'état led by General Ariosto Herrera and Carlos Ibáñez, who had been regarded as a supporter of the Government. The attempt failed. Political feeling continued to run high throughout the year, and, in December, when former President Alessandri (a political opponent of Aguirre Cerda) was returning to the country after an absence of several months, he was threat-

ened by a mob in Antofagasta. Late in December, dissension within the ranks of the Popular Front over fiscal policies brought about the resignation of the Finance Minister Roberto Wacholtz.

Actual concrete achievement of the Aguirre Cerda administration during 1939 was slight, for the economic dislocation caused by the January earthquake disaster and, later, by war and threat of war in Europe, coupled with internal political opposition, materially slowed down progress. The greatest specific achievements were in the realm of improved housing, where 393 new houses were completed, 2,501 were under construction at the close of the year, and construction of 1,383 more was planned for the immediate future. Cost of the housing program was 25,000,000 pesos.

Another feature of the year was the inauguration of a "back to the land" movement. Plans were made for large scale colonization in agricultural regions, particularly the sparsely settled far south, with the settlement of 40,000 families the goal. Several small groups of European political refugees were accepted during 1939, and, late in December, approximately 1,000 mid-European Jewish and other refugees who arrived on the Italian motorship "Augustus" were tentatively accepted despite irregularity of papers, provided they settled in the southern agricultural region.

Chilean foreign relations in 1939 were concerned, early in the year, with a dispute with the Franco Government in Spain over the right of asylum in the Chilean legation in Madrid, a right which was tacitly conceded in October. Chile promptly declared her neutrality in the European War and participated in the Panama Conference in September. Nevertheless, she failed to join with other nations of the Americas in unqualified denunciation of Russian aggression against Finland. Some excitement was caused in December by the British capture of the German steamer "Dusseldorf" 12 mi. off the Chilean coast, but on the whole Chilean official and public opinion was pronouncedly anti-Hitler. Late in the year negotiations with the United States for a reciprocal trade agreement were reported to be on the point of consummation. Arbitration of the Beagle Channel islands dispute with Argentina made no progress during 1939.

Education.—Primary education is free, non-sectarian, and compulsory. In 1938 there were 3,504 public primary schools (enrolment, 460,715); 820 private primary schools (enrolment, 97,177); 85 secondary, including the military and naval school (enrolment, 28,177), and 119 special schools (1937 enrolment, 25,296). There are four universities, the National university at Santiago (4,504 students), two parochial, one private (Santa María Technical university at Valparaíso), with a total enrolment of nearly 7,000 in 1938. The summer school of the National university, held at Santiago each January, has attracted wide attention and is a mecca for students from all parts of America.

Army and Navy.—Chile has an Army of approximately 30,000 men, and a reserve of around 175,000. A military mission from the United States was arranged in July 1939. The Navy was formerly the most up-to-date in South America, but has declined.

Finances.—The monetary unit is the peso (controlled value: 5.17¢ U.S.; uncontrolled, approximately 3½¢ U.S.). The gold peso ("peso de 6d."), valued at 6d. gold, or 20¢ U.S., is used in foreign trade transactions. The public debt was \$382,151,000 U.S. on Dec. 31, 1938. The budget for 1939 called for expenditures of 1,666,800,000 pesos.

Trade and Communication.—Chile has direct steamship service to Peru, Ecuador, and Panama, and, by way of the Panama canal, to the United States and to Europe. Service to the east coast of South America is maintained through the Strait of Magellan. Regular frequent air transport service northward to Panama and New York, and eastward to Buenos Aires connects the country with all parts of America. Air transport to Europe by German (in peace time) and French lines is effected in four days' time. There

CHILE: Industrial production, adjusted for seasonal variation (*The Annalist*)

are three railway routes to Argentina, available in combination with other connections. Freight service on the Transandine line by way of Uspallata pass has been suspended since its interruption by landslides in Jan. 1934. Railways connect the northern ports of Arica and Antofagasta with Peru and Bolivia.

Internal communication is by railway, coastwise shipping, air, and highway. The Government-owned railway system extends to Puerto Montt in the south. Total railway mileage is 8,352 km. (Aug. 1939). In 1938 orders for new railway equipment were placed in Germany and paid for, but delivery had not been effected at the outbreak of war. In Dec. 1939 arrangements were reportedly made for special permission to bring this equipment through the Franco-British blockade of Germany. Meanwhile, other needed equipment had been ordered in the United States. Communication with the far south is by boat and aeroplane. Internal air transport service is well developed under Government ownership, with routes totalling nearly 5,000 km. in length. A highway system of over 23,000 mi. in length, including 9,500 mi. of improved roads, is being rapidly developed and extended under a comprehensive program adopted in 1936. The Chilean merchant marine is one of the largest in Hispanic America. Service under the Chilean flag is regularly maintained to Buenos Aires, to Guayaquil, and to New York.

Chilean foreign trade in 1938 declined 13.7% from that of 1937, but was 25% greater than in 1936. Exports (682,200,000 gold pesos) were 26.9% less, imports (502,000,000 gold pesos) were 16% greater. Imports came principally from the United States (26.7%), Germany (25.0%), Great Britain (10.6%), Peru (5.8%), Denmark (4.4%), Argentina (4.3%). Exports went chiefly to Great Britain (21.8%), United States (15.7%), Germany (10.0%), Belgium (7.8%), France (4.4%), Italy (4.0%), Sweden (3.1%). Copper and nitrates together account for 80% of all exports. A 28% decline in the price of copper was largely responsible for the export decline in 1938. The increased import value was due largely to heavy aeroplane and merchant ship purchases. The bulk of imports is in manufactured goods, especially machinery and textiles. In the first 11 months of 1939, imports were 372,190,494 gold pesos, a heavy decline, exports 608,507,407 gold pesos. Imports were from the United States (30%), Germany (24%), Great Britain (8.3%), Peru (7.4%), Argentina

(4.4%), Italy (4%), Japan (3.4%), France (2.4%). In November imports from Germany were 11.5%, from the United States, 38%. Exports (11 mos.) were taken by the United States (28.3%), Great Britain (13.4%), Germany (9.2%), Sweden (5.0%), Bolivia (4.96%), France (4.8%), Italy (3.5%).

Agriculture and Mining.—Mineral production is chiefly of copper and nitrates, with totals dependent upon foreign demand and consequently shifting violently from year to year. Copper production in 1938 (308,928,979kg.) was 25% less than the all time record figure attained in 1937. The 1937 total represented 18.8% of all world consumption, highest proportion ever attained by Chile with the single exception of 1934, when it was 18.85%. Nitrates are second in importance, but production and export bear little relation to each other. Other mineral production in 1938 included gold, 9,144kg.; iron, 1,607,000 tons; coal, 2,061,409 tons; silver, 43,984kg. The average monthly employment in the mining industry during 1938 was 65,365 persons, a 3,442 decline from 1937. Nitrate workers totalled 20,147; copper miners, 19,394; coal miners, 13,822. Although minerals are the chief exports, agriculture is the principal industry, with its products largely for domestic consumption. For the season 1939-40, 1,060,908 hectares were sown in cereals, of which wheat was the most important. Fruits are likewise grown extensively, as are grapes. Chilean wine is important. The pastoral industry has made notable progress in recent years, and centres in the far south. There are an estimated 2,634,499 cattle, 5,749,069 sheep, 810,206 goats, 571,495 swine, 527,927 horses in the country. Wool (9,746 metric tons in 1938) and fresh meats (10,465 tons) were exported in 1938, the greater part from the port of Punta Arenas.

Manufacturing.—Manufacturing is insufficient for domestic demands, but is rapidly increasing. Public utility services, food-stuffs, paper manufacturing, and metal work are the most important from the point of view of employment.

(L. W. BE.)

China, a republic in East Asia, bounded on the north-east by Manchoukuo, on the north and west by Outer Mongolia, Siberia, and Tibet, on the south by India, Burma and French Indo-China, on the east by the Pacific ocean. Capital, Nanking (temporarily removed to Chungking); president, Lin Sen. Excluding those areas over which no effective Chinese sovereignty has been exercised for many years (Manchoukuo, Outer Mongolia, Tibet) China has an area of 2,903,475 sq.mi. and a population of 422,707,868, according to the estimate of the Ministry of the Interior in 1936. No comprehensive census has ever been taken. Population of larger cities: Nanking (estimated, 1937), 1,000,000; Shanghai (foreign and Chinese administrative areas reckoned together, census of 1935), 3,490,762; Peking, 1,487,289; Canton, 861,024; Hankow, 777,993; Tsingtao, 440,135. There were about 185,000 foreigners in China, including 74,000 Japanese, 64,500 Russians, 13,344 British, 8,637 Americans, and 3,444 Germans. The number of Japanese has now substantially increased especially in the cities and towns of North China.

History.—(For the Chinese-Japanese War, see that heading.) The Kuomintang is the sole legal political party in China and the National Government derives its authority from the Kuomintang. There are no general elections; and the nearest approach to a representative body in China is the annual plenary session of the Kuomintang central executive committee and central supervisory committee. The Government is composed of five yuans or departments, the functions of which are indicated by their titles: the executive, legislative, judicial, examination, and control yuans. The Executive Yuan exercises general supervision over the ministries and commissions and its president is really the acting head

of the Government. The president of the National Government possesses only titular powers. The Legislative and Judicial Yuans are concerned respectively with the drafting of laws and the administration of justice. The Examination Yuan is in charge of Government personnel matters and the Control Yuan exercises functions of general supervision and auditing. There is also a cabinet of ministers. The leading figure in the National Government throughout the last decade has been Marshal Chiang Kai-shek.

Education and Religion.—Estimates of illiteracy in China vary from 60-80%. Substantial progress in the educational field has, however, been registered since the establishment of the republic. There were 11,667,888 pupils in elementary schools in 1935, as against 2,793,633 in 1912 and the number of universities and colleges during the same period increased from four to 82. There has been a special effort to spread adult literacy in the larger cities and in some selected rural districts.

Normal educational activity has been seriously affected by the war and the movement of vast numbers of refugees from one part of the country to another. There has been a transfer of higher educational institutions from such occupied cities as Peking, Nanking, Shanghai, and Tientsin to towns in the remote interior, such as Chengtu, in Szechuen, and Kunming, in Yunnan. China's main religions are Buddhism, Taoism, and Confucianism. There are between 5,000,000 and 10,000,000 Mohammedans, mostly in the north-western and far western provinces of the country. There were 2,818,839 Catholics and 512,873 Protestants in China at the beginning of 1935.

Army.—On the eve of the outbreak of the Sino-Japanese war the Chinese armed forces, organized in 16 route armies and 51 armies, (the route armies are larger military units) consisted of 2,271,330 men, of whom 1,996,920 were under the direct control of the National Government, the remainder constituting provincial forces. There are no reliable reports of the forces engaged or of casualties in the present hostilities. Chiang Kai-shek is believed to have maintained fairly intact a force of 150,000-200,000 picked troops, and soldiers from Kwangsi Province, in the south-west, have given a good account of themselves in the war, probably because Kwangsi had one of the most efficient provincial systems of conscription and military training.

Finances and Banking.—The unit of currency is the yuan, or dollar, which was worth 29.65 American cents at the end of 1937, but had fallen to less than eight cents by Oct. 1939.

The general position of the Chinese currency is not altogether accurately indicated by this severe decline. The chief effect of the fall of the Chinese dollar has been felt in Shanghai, where a system of free exchange prevails. Official support for the Chinese dollar was withdrawn in the summer of 1939, because it was believed that Japanese interests in Shanghai were benefiting from the ability to buy foreign exchange with Chinese dollars and because the Shanghai money market was threatened with an influx of Chinese currency from the North, collected by the Japanese. In the interior of the country the purchasing power of the Chinese dollar, except in relation to foreign imports, has been very much less affected than the present low exchange value of the dollar would indicate. The budget for 1937-38 was supposed to be balanced at 1,000,649,496 dollars; but the outbreak of the war unquestionably affected both income and appropriations. No subsequent budget has been published. According to the budget of 1937-38, the chief items of revenue were supposed to be customs receipts (36.9%); the salt tax (22.85%) and the consolidated tax, a levy on trade and industry, (17.55%). All these sources of revenue have been gravely impaired by the Japanese occupation of China's main ports and industrial centres, and of some of the chief salt producing areas. The war has been financed largely by loans and by a policy of drastic retrenchment in Government

expenses, while munitions and supplies from abroad have been paid for largely with exports of silver and by drawing on reserves in foreign banks. The three largest and most important banks in China are the Central Bank of China, the Bank of China, and the Bank of Communications. There are also 14 Japanese and 19 other foreign banks which carry on business in China.

Trade and Communications.—China's imports amounted to 941,545,000 Chinese dollars and exports to 705,741,000 dollars in 1936. Exports were stimulated by the abandonment of the silver basis of the currency in 1935 and the depreciation of the Chinese dollar. China's exports during 1937 amounted to 838,255,705 Chinese dollars, imports being 953,386,007 dollars. The year 1938 did not reveal any very great change, with exports at 762,600,000 dollars and imports at 886,200,000 dollars. But of course the real quantity of trade diminished because of the lower value of the Chinese dollar. Reckoned on the more stable basis of pounds sterling (with the pound then worth 4.68 American dollars) China's imports during the first six months of 1939 were £43,545,095, as against £23,403,602 in the first half of 1938. Exports, on the other hand, revealed a decline, from £16,464,557 in the first half of 1938 to £13,394,596 in the same period of 1939.

China had between 6,000 and 7,000 mi. of railways at the end of 1936 and a five-year plan for the construction of 5,300 additional miles after 1936. Highway construction, which had increased substantially during recent years, reached the figure of 56,000 mi. in 1935. According to a report of the ministry of communications in 1931, China had 2,986 registered ships, with a tonnage of 431,892. China has no trans-oceanic shipping lines and much of the coastal shipping is in the hands of British and Japanese firms. A total of 87,755 ocean vessels entered and cleared at Chinese ports in 1936. British ships represented 16,000,000 tons; Japanese 9,500,000 and Chinese 7,300,000. The Government telephone system in 1935 served 21 cities and 62 others were served by private and provincial systems. About 250,000 telephones were in use. China has 53,000 miles of telegraph lines and several high-power radio installations.

The effect of the war has been to wipe out Chinese coastal and river shipping. Japanese shipping enjoys preferential position, although British established lines are still maintaining services along the coast of China and have extended these to Indo-China, now an important country of transit trade with the interior of China.

HATE SHOWED ON THE FACES of this Chinese mob rioting for food in 1939 in the International Settlement of Shanghai

The war with Japan had a varied effect on China's economic development. It brought great misery to a large part of the population as a result of acts of devastation carried out by both sides. By the end of 1938, much the greatest part of China's railway network was in the possession of the Japanese Army. Japan had also taken over the communication systems in occupied territory. On the other hand railway and road construction in the unoccupied south-west was stimulated. (For some of these new routes see *CHINESE-JAPANESE WAR*.)

The chief cities of China are linked up by air routes, which often serve as a substitute for non-existent rail connections. Commercial aviation is in the hands of the Sino-American China National Aviation Corporation and the Sino-German Eurasia Aviation Corporation.

Agriculture, Manufactures, and Mining.—China is an overwhelmingly agricultural country and is predominantly a land of small-scale farming. As many as 36% of its farms are less than 1.5 ac. in size, while 62% are less than 4.3 ac. Rice is the main crop and the main food in the southern and central part of the country, while wheat, millet, kaoliang, and other grain crops are raised in the North. Animal husbandry is little practised, as there is little spare land for pasturing. China has fallen behind in the production of its traditional tea and silk because of lack of standardization and grading; efforts have been made recently to improve quality and increase output of tea, silk and cotton.

Japan has extensive plans for the reconstruction of industry in those parts of China which have passed under its military control. Two semi-governmental corporations, the North China Development Company, capitalized at 350,000,000 yen, and the Central China Development Company, capitalized at 100,000,000 yen, have been established for the exploitation of these two parts of China. No large enterprises have yet been undertaken, partly because of lack of capital, partly because of unsettled conditions off the railway lines. Japan hopes in time to obtain iron ore from the Lungyen fields (north-west of Peking) and the Tayeh deposits (near Hankow), cotton from several provinces of North China, and coal from Shansi.

A certain amount of industrial salt is already being obtained in the neighbourhood of Tientsin. The Japanese cotton mills which were destroyed by the Chinese before they abandoned Tsingtao are being slowly rebuilt.

Chinese-Japanese War. The Chinese-Japanese War which began when Japanese troops clashed with a Chinese garrison at the Marco Polo bridge, near Peking, continued throughout 1939. However, a substantial change in the character of the war became evident after the Japanese had occupied Canton on Oct. 21, 1938, and Hankow a few days later, on October 27.

This left the Japanese in military control of what were formerly China's seven largest cities¹, Peking, Tientsin, Shanghai, Tsingtao, Nanking, Hankow and Canton. They also held 80% or 90% of China's network of railways. It was officially claimed in Tokyo that by the end of 1938 the Japanese controlled areas amounting to 1,505,700 sq.km., with a population of 170,000,000, while the war fronts were 3,400km. in length. As against this, it was a matter of common knowledge that the Japanese hold on regions off the railway lines was extremely loose and imperfect and the two local Chinese Governments which had been set up under Japanese auspices in Peking and Nanking were definitely lacking in independent prestige and authority.

The capture of Canton and Hankow left the Japanese with few definite objectives to strike at, except at the price of difficult expeditions into a mountainous interior without railways and with only a few good roads. As a result of this change in the situation, there were no repetitions, during 1939, of the large campaigns which, in 1937, had led to the occupation of Shanghai and Nanking, and, in 1938, to the conquest first of Hsuehchow-fu, later of Canton and Hankow. Japanese military operations during 1939 fell into three main categories: limited drives for local objectives, air raids, designed to destroy military supplies and to demoralize the civilian population, and naval landing expeditions. The amount of new territory which was even nominally added to the Japanese sphere of conquest during 1939 was very small.

Japanese Military Operations.—The first major Japanese military move of 1939 was the landing on Hainan island on February 10. This is a large and potentially rich territory, about the size of Formosa. It consists of a coastal fringe which has been settled by the Chinese, and of a little-known, wild interior, inhabited by primitive aborigines.

The Japanese Navy had long coveted Hainan as a most promising base of operations in the South Pacific. It lies squarely athwart the British line of communications between Hongkong and Singapore and is within easy bombing distance of Haiphong and Hanoi, the chief northern port and the capital of French Indo-China. Under normal conditions British and French objections might have prevented the occupation of Hainan. But both Great Britain and France were gravely preoccupied with the crisis which was looming up in the Mediterranean area in connection with the concluding phase of the Spanish Civil War. So the Japanese landing, which encountered only weak Chinese resistance, passed off unchallenged. The Japanese Navy had still earlier taken over some small islands off the southwestern coast of China. On March 31 it made a further thrust to the south, seizing the Spratly islands, which are between French Indo-China and British North Borneo and had hitherto been claimed by France. The Spratly group is of negligible territorial and economic significance, including only 247 acres; but represents a useful advanced submarine base for naval operations in the South Pacific.

The first land campaign of any consequence led to the capture, on March 27, of Nanchang, the capital of Kiangsi Province. This,

¹There have been important alterations in the population of Chinese cities as a result of the war. Nanking, the former Nationalist capital, has shrunk from about 1,000,000 inhabitants to a little over 300,000 and Hankow and Canton have also greatly diminished. On the other hand such cities of the interior as Chungking, Kunming, and Chengtu have greatly increased in size.

incidentally, was the only important inland town which the Japanese added to their possessions during the year. The Chinese continued to hold a considerable stretch of the Canton-Hankow railway, from Changsha, the capital of Hunan, to a point not very far north of Canton. The Japanese launched a drive against Changsha, which had been precipitately burned down by the Chinese themselves not long after the capture of Hankow, in the autumn of 1939, but this drive fell short of its objective.

The Japanese objective of isolating China from sea-borne supplies was pushed ahead by the occupation of the minor ports of Haichow, on March 4, and of Wenchow later in the year. Swatow, a fairly large port in South China, was occupied on June 21. China was thus made more dependent on roundabout and expensive routes of overland communication, of which three were of primary importance. These were as follows:

(1) Indo-China. A narrow-gauge mountain railway leads up from Hanoi, in Indo-China, to Kunming, the capital of Yunnan Province. It has also proved possible to ship supplies into Kwangsi Province by road from Indo-China. Haiphong, the normally rather sleepy port of northern Indo-China, became glutted with foreign supplies, purchased for Chinese account.

(2) The Burma-Yunnan highway. This 700-mi. road, much of it over difficult mountainous country, was opened up for traffic during the latter part of 1938. It had been pressed to completion by the conscripted labour of over 100,000 coolies. Liability to washouts, especially in the rainy season, reduces the effectiveness of this route as a channel of supplies, and a road can never be an adequate substitute for a railroad. However, a truck service of increasing proportions has been inaugurated and the Burma highway possesses one distinct advantage over the routes of supply through Indo-China. Munitions can be imported without let or hindrance, whereas the French authorities in Indo-China, apprehensive of Japanese reprisals, have forbidden the transportation of munitions to China through this colony.

(3) The "Red route" from Urumchi, in Chinese Turkestan via Lanchow to Sian, capital of Shensi Province. The huge distance from the nearest Soviet rail-head to Sian and the rough character of the former caravan trail which constitutes the basis of this route impose limitations on the amount of munitions and other supplies which China can import, largely on a barter basis, from the Soviet Union.

The Japanese made no effort to penetrate into the remote interior of China. They did, however, let loose a number of sporadic, but sometimes very destructive, air raids against the new Chinese military and industrial centres, such as Chungking, the Nationalist capital, 1,000mi. up the Yangtze river from the coast, Kweiyang, capital of Kweichow Province, Kweilin and other towns in Kwangsi Province.

While the Japanese failed to advance appreciably during 1939, the Chinese also experienced no success in recapturing towns which were under Japanese occupation.

The war tended more and more to assume an irregular guerrilla character, which is always difficult to follow and describe with even approximate accuracy. All that is certain is that a good deal of destruction was inflicted on the unfortunate peasant population, both by the guerrillas in their raids and by the Japanese in their reprisals.

The effectiveness of the irregular resistance, assisted by mobile units of the regular Chinese forces varied from province to province, depending on the character of the terrain and the capacity of the leadership.

Mountainous Shansi Province, where there were considerable forces of Chinese Communist troops, veterans of long guerrilla campaigns against the Nationalist Government in the decade before the outbreak of the Chinese-Japanese War, proved ex-

A TWO-DAY RAID of Chungking by Japanese bombers on May 3 and 4, 1939, killed thousands of Chinese

tremely difficult for the Japanese invaders.

On the other hand, there were times when large towns like Tsingtao were held without difficulty by extremely small Japanese garrisons, and foreign observers sometimes expressed surprise at the lack of initiative of the guerrillas in neglecting opportunities to blow up ammunition dumps and destroy supplies in places where there were only small Japanese forces. A fairly regular train service, interrupted now and then, to be sure, by wrecks, was operated by the Japanese over the railways which they occupied.

Quarrels, personal and political, among the guerrilla leaders themselves not infrequently hampered their effectiveness. While the Chinese Communists were supposed to be included in the united national anti-Japanese front, some of the Communist newspapers complained that local Chinese "reactionaries" occasionally attacked the Communist guerrillas. It is difficult to draw a hard-and-fast line between irregular warfare and banditry. This is especially true in China, where banditry has long been an inevitable outgrowth of poverty, maladministration and overpopulation. Not a few guerrillas are more interested in living off the country than in fighting the Japanese.

War Becomes Endurance Contest.—With the period of big campaigns and drives for definite objectives apparently ended, the war between Japan and China tended to become more and more a contest in national endurance. It is both less than a war and more than a war. It is less than a war because of the small scale of the operations. On the Japanese side these are largely restricted to short drives for limited objectives, frequent mop-up campaigns against guerrillas behind the lines and periodic air raids on Chinese cities and routes of communication.

The Chinese reply is largely in the form of partisan warfare and well organized terrorism against those Chinese who consent to

serve in the Japanese-sponsored local administrations. Neither side can reasonably hope to achieve decisive or spectacular victory in any short period of time by such tactics.

At the same time the struggle is more than a war. Its economic, financial and diplomatic aspects tend to overshadow the purely military aspects. When Japan is able to buy Chinese foodstuffs and raw materials for yen or for the new currencies which are sponsored in the occupied regions or to destroy some Chinese reserve of oil, imported for precious foreign currency, this is the equivalent of a military victory. The reverse is the case when the Chinese are able to wreck some Japanese rolling-stock, to tear up Japanese rails, to find new avenues of export for their products.

Both China and Japan are digging in for a protracted test of endurance. A very significant and probably permanent result of the war has been a remarkable shift of Chinese industry, education, and even population to the hitherto undeveloped provinces of the west and south-west, to Szechuen, Shensi, Kweichow, Yunnan. New factories are being built, universities established, roads and, at a much slower pace, railways are being inaugurated. While exposed to air attack, these regions are reasonably safe against overland invasion; and it is Chiang Kai-shek's policy to husband China's national strength and resources there until circumstances make possible a return to the temporarily lost coastal provinces.

As for the Japanese, they give every indication of having come to stay in the occupied areas, especially in North China. Various industrial and trading monopolies have been established and there has been a remarkable influx of Japanese merchants, traders, handicraftsmen, restaurant keepers and others not only into such large cities as Peking and Tientsin, but into the smaller provincial towns along the railway lines.

A war of banknotes has been going on side by side with the war of bullets, bombs and shells. At first sight Japan may appear to have come off better in this currency war. The Japanese yen, worth between 28 and 29 cents when the war broke out was quoted at a value of 23.65 cents late in Oct. 1939. The Chinese dollar, formerly worth almost 30 American cents, was (Dec. 31, 1939) quoted at less than eight cents.

It must be remembered, however, that the yen is rigidly and artificially controlled, like the German mark. The Chinese dollar, on the other hand, has been left to find its own level and, unlike the yen, has been interchangeable for foreign currency. The downward slide of the Chinese dollar on the Shanghai market during the summer of 1939 was deliberately left unchecked because the Japanese, who had acquired large quantities of Chinese notes in North China, hoped to transform these into foreign currency—an operation which would, of course, have been disadvantageous to China. In free markets, such as Shanghai, the Japanese yen has been far below its official rate of foreign exchange and at times has even fallen below the Chinese dollar.

Japan has endeavored to install its own currencies in occupied Chinese territory, with the idea of buying up Chinese foodstuffs and raw materials which may then either be used in Japan or sold for badly needed foreign exchange in other markets. The largest of these new issues is the Federated Reserve Bank notes, put out in North China. Although these notes are supposed to be on a par with the Japanese yen, they have been at a persistent discount in relation to the Nationalist Chinese dollar, a discount which was at one time as high as 40% and later fell to 18%. The circulation of these notes is restricted to cities and districts under direct Japanese control. Guerrillas have made a practice of executing Chinese found in possession of large quantities of this money.

So-called military yen, officially valued as worth two Chinese dollars have been used for the payment of Japanese troops in Central and South China and have achieved limited acceptance as currency in regions where there are considerable numbers of Japanese

troops. The Hua Hsing Bank, of Shanghai, has put out another Japanese-sponsored currency which, rather curiously, is supposed to be equal in value to the Chinese Nationalist dollar, although the Japanese have frequently predicted that the latter is doomed to collapse.

The war has been enormously costly to both countries. China's losses have been the most obvious. Apart from a great amount of outright physical destruction, especially in the Chinese part of Shanghai, a very large amount of Chinese State and private property has been expropriated by the Japanese Army and by Japanese business firms. Millions of refugees have been uprooted and thrown from one end of the country to another. The main centres of trade and industry are in enemy hands; customs revenue, always an important item in the Chinese budget, has almost entirely disappeared; and valuable natural resources such as the iron, coal, and salt of North China have passed into Japanese hands.

The war has been fought off Japanese soil and Japan's losses are not so visible to the eye. But these are also far from light. Unproductive war expenditures have depleted the country's slender gold reserves and cut deeply into its standard of living. Although the yen has been held at an artificial rate, the wholesale price index had risen by 32% and the retail price index by 30% during the two years after the outbreak of the war—a clear symptom of inflation.

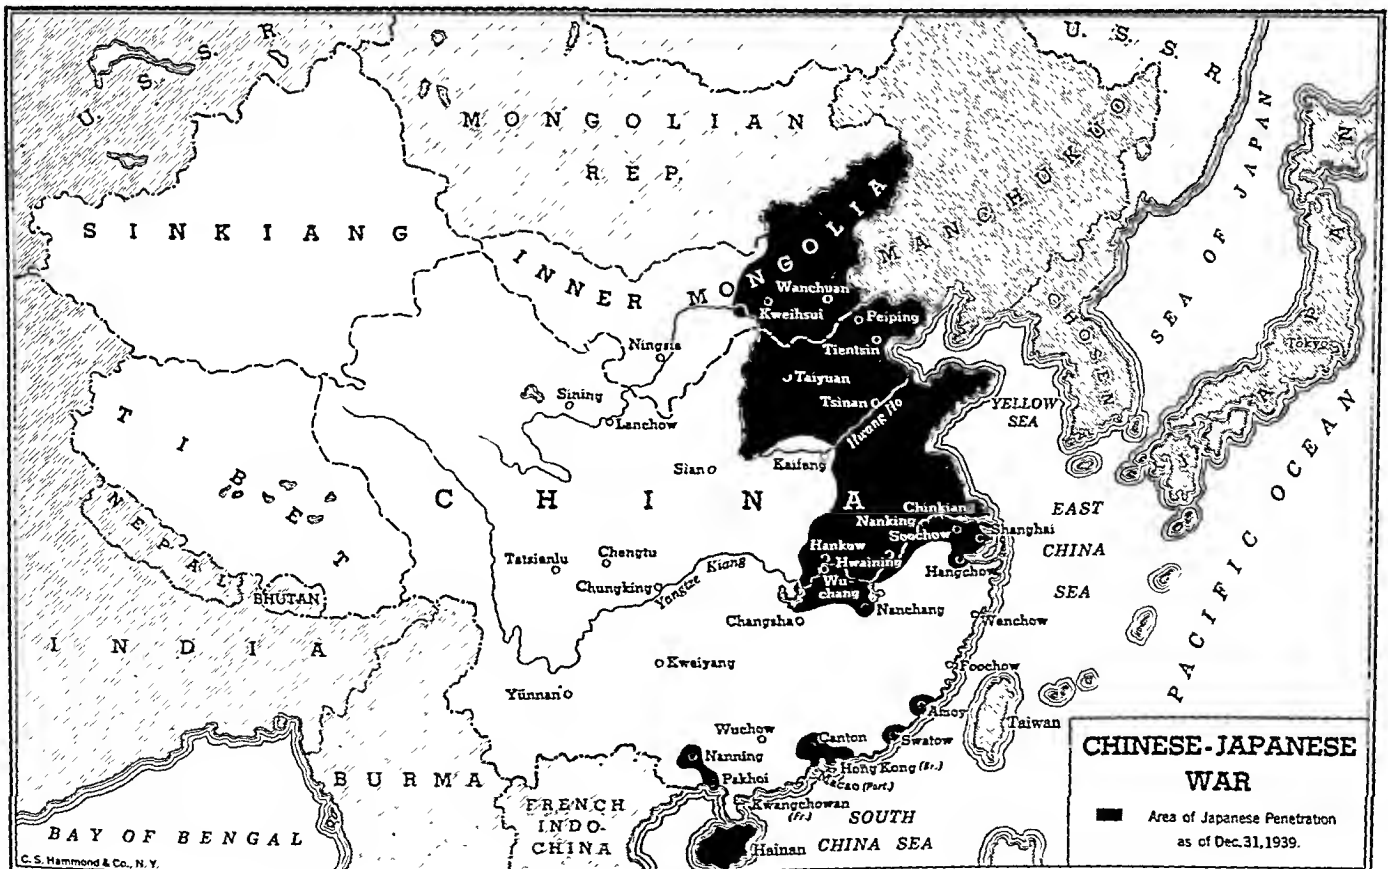

These official indices, incidentally, understate the actual rise in prices, because they are partly based on theoretical controlled prices which do not prevail in the markets.

Higher prices mean a higher cost of living, for which there has been no compensating increase in wages and salaries. At the same time Japan's national income from shipping and foreign trade has been heavily reduced, because of the necessity of employing ships for war purposes, because of difficulty in obtaining raw materials when the country's stocks of gold and foreign exchange are constantly becoming less.

Japanese Hopes for Settlement.—It is a curious and significant fact that Japan, despite its military victories, has more than once taken the initiative in trying to promote a settlement of the conflict with China. Its first offers, put forward through the agency of Dr. Oskar P. Trautmann, German ambassador to China, in Nov. and Dec. 1937, were not considered acceptable by the Chinese Nationalist Government. Japan's next "peace offensive" was launched on Dec. 22, 1938. It was not addressed to any specific regime in China, because in Jan. 1938, the Japanese Government had renounced the idea of dealing with Chiang Kai-shek and the Nationalist Government.

The Japanese premier at that time, Prince Fumimaro Konoye, simply outlined the Japanese conception of satisfactory terms of settlement. Annexations and indemnities were renounced; but Konoye proposed that special facilities for Japanese development of natural resources should be granted, especially in the north, that Japanese troops should be stationed at specified places in China, while China was to associate itself with the anti-Comintern pact and to recognize the independence of Manchoukuo.

Konoye's terms were repudiated by the Nationalist regime at Chungking. During 1939 Japan's soldiers and statesmen tried to find a Chinese, more representative than the heads of the dependent Chinese Governments which have been set up in Peking and Nanking, to head a new administration with which Japan might make peace. The two names most often mentioned in this connection were those of Wu Pei-fu, a formerly powerful warlord in Central China who had been living in retirement in Peking, and of Wang Ching-wei, the sole prominent figure in the Kuomintang who openly seceded from the Nationalist camp and expressed himself in favour of peace on the basis of Prince Konoye's terms. Wu Pei-fu (*q.v.*) could not be coaxed out of retirement and up to late fall Wang Ching-wei, despite several rumours of impending action on his part, had taken no positive steps toward the formation of a government.

The European War.—The outbreak of a new great war in Europe is bound to have the strongest effects on the Chinese-Japanese struggle. These effects might have been more prompt and more spectacular if the European war had broken out a few months earlier. For the "anti-Comintern" policy of close association with Germany and Italy had strong advocates in Japan.

But this policy received a mortal blow when Germany and the Soviet Union signed a non-aggression pact on Aug. 24, 1939. This pact paved the way for the outbreak of war in Europe. But in Asia it made for moderation because it left the Japanese extremists who had taken Germany's anti-Communist professions seriously and envisaged common action with Germany against the Soviet Union crestfallen and disillusioned. The cabinet of Baron Kiichiro Hiranuma, which had been in office at the time of the conclusion of the German-Soviet Pact, resigned and made way for a new cabinet, headed by an elderly general with a reputation for moderation, Nobuyuki Abe. This cabinet issued a statement to the effect that "Japan does not intend to become involved in the European war and will concentrate its efforts on the settlement of the China affair."

The Japanese press started a campaign for the withdrawal of the troops and warships of the Western Powers from Chinese cities and waters, but this, up to late fall, had not been followed by any positive action calculated to aggravate Japan's already strained relations with Great Britain and America.

There were two important differences between the Far East in 1939 and the Far East at the time of the World War (1914-18). At that time Japan was an ally of Great Britain and entered the war on the Allied side. It seized the German possessions in the Orient and helped to keep open British sea lanes of communication. No such co-operation is to be anticipated today. Indeed, in the light of the political developments of the last few years Great Britain and France are probably glad to be able to rely on at least a provisional Japanese neutrality.

The World War (1914-18) was a windfall to Japan, especially to its trading and shipping interests. Market openings for Japanese goods sprang up all over the world because of the war pre-occupations of the leading industrial European Powers. Remaining on the outer fringes of the world conflict and not forced to put forward any great national effort, Japan was in a position to enrich itself, or at least those classes which benefited from the war trade boom and to lay the foundation of its subsequent industrial and commercial expansion.

No such possibility is open to the Island Empire now, because it has already mortgaged its economic resources so heavily in the war with China. The lack of foreign exchange hinders the purchase of the raw materials. Much the greatest part of Japan's merchant marine is engaged either in direct war auxiliary service or in the transportation of goods and materials between Japan, Manchoukuo, and China. The chances of profiting directly from the European war are therefore much more limited than was the case 25 years ago.

Japan took advantage of the World War to press its program of expansion in China; it was no accident that the famous Twenty-one Demands were presented to China in 1915, when no European Powers could give China effective support. The present situation is different, because Japan is already engaged in war for the purpose of imposing its will on China. The actual state of war, of course, makes England and France more helpless in the Far East, although the acute threat of war which existed during the last years had much the same effect. On the other hand, Japan must still reckon with the United States, still quite fresh and uninvolved in Europe.

Results and Prospects.—This Far Eastern war, affecting one-quarter of the human race, has (1940) entered its third year. The

gulf between Japan's claim, advanced under various formulas, for what amounts to a position of hegemony in China and the Chinese Government's demand for respect of China's administrative and territorial integrity and sovereignty seems as wide as ever. Certain results of the war may, however, be assessed, and certain prospects for the future suggested.

The Japanese state that up to the end of April 1939 their losses in killed were 59,998, while the Chinese losses had been 936,345. The Chinese, on the other hand, offering no estimate of their own losses, placed the Japanese figures at 864,500 up to May 15, 1939.

While the Japanese estimate of their own losses is probably an understatement it is almost certainly much closer to the truth than the Chinese figure. There is no way of accurately calculating Chinese losses. Probably the losses among civilians who have perished as a result of famine, floods, exposure, disease and other accompaniments of war are even greater than among the troops. Because of inferior equipment and training the latter have certainly lost much more than the Japanese.

Events have shown that the Japanese cannot conquer all China and that the Chinese cannot drive the Japanese from the ports, large towns and strategic areas which the latter hold. Both countries have suffered severely economically and financially; the standard of living has fallen in both, as a result of war sacrifices.

China has, of course, sustained a good deal of human and material destruction for which there is no parallel in Japan. It would be rash, however, to say that either Japan or China is on the eve of collapse. All that seems certain is that the longer the war goes on the less decisive become the purely military aspects of the struggle.

On the other hand the element of morale, the economic and financial considerations, the possible effects of the European war and of the policies of outside powers tend to bulk larger as factors which will finally decide the issue of the Chinese-Japanese War. (See also ARMIES OF THE WORLD; FOREIGN MISSIONS; GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF; INTERNATIONAL LAW; LEAGUE OF NATIONS: *China*; NEUTRALITY; UNITED STATES: *Foreign Relations*.)

Chinese Turkestan: see SIN KIANG.

Chosen (Korea), a part of the Japanese Empire, is a peninsula extending southward from the north-eastern part of the continent of Asia. Its eastern coast faces the Sea of Japan, its western coast the Yellow sea; and it borders Manchoukuo and the maritime province of Siberia on the north. Area 85,206 sq.mi., including 1,018 islands. Population (Dec. 31, 1936) 22,047,836, including 608,959 Japanese and 65,275 Chinese and other foreigners. The capital is Seoul (Keizyo), population (1933) 382,491. Other cities: Fusan, 139,538 (1931); Phyöng-yang (Heizyo), 144,215; Taikyu, 102,180. Governor-general, General Jiro Minami (since 1936). Chosen (Korea) was annexed to Japan in 1910, after a preliminary period of Japanese protectorate. It is administered by the Government-General, which has eight administrative offices. The governor-general is assisted by a consultative body known as the central council, consisting of a chairman and vice-chairman, five advisors and 65 councillors.

Education and Religion.—Chosen in 1936 had 4,440 schools of all kinds, with 1,087,387 students. There are a number of Christian mission schools in the country. Prevalent forms of religion among the Koreans are Buddhism, Taoism, and Confucianism. There were 441,419 Christians in Chosen in 1934.

Finances and Banking.—The unit of currency is the Japanese yen (worth 23.65 American cents at the end of 1939). The Bank of Chosen is the central banking institution and there are ten

other banks, with deposits totalling 686,191,000 yen. The budget for 1939-40 was 643,217,000 yen.

Trade and Communications.—Chosen's foreign trade is mainly with Japan. Exports in 1937 were valued at 685,542,752 yen and imports at 863,552,502 yen. Of the exports, 518,047,000 yen worth were sent to Japan, and 647,918,000 worth of imports were purchased from Japan.

Exports to foreign countries in 1937 were 113,098 yen and imports from foreign countries were 126,052 yen. There were 3,129mi. of railways and 17,244mi. of roads in 1937. There were 1,134 steamers with a tonnage of 70,184, and 11,730 sailing-boats with a tonnage of 150,473. There are three airports, at Seoul, Ph्यों-yang and Urušan and regular air communication is maintained with Japan and Manchoukuo. The total length of telephone and telegraph lines is 9,531km. and 8,758km. respectively.

Agriculture, Manufactures, Minerals.—Chosen is overwhelmingly an agricultural country and over 80% of its population is engaged in farming. Rice is the main crop, production in 1936 reaching the figure of 97,000,000bu. of which a little less than half was exported to Japan. Other agricultural products include wheat, barley, soya beans, apples, cotton, sugar-beets and silk. Gold is the most valuable mineral resource; its output in 1936 was valued at 49,909,000 yen (about \$14,000,000). No figures of gold production have been issued since the summer of 1937.

Christian Front: see ANTI-SEMITISM; PROPAGANDA.

Christian Science. For the Christian Science movement (which includes The Mother Church, The First Church of Christ, Scientist, in Boston, Massachusetts, and its branches throughout the world), 1939 was another period of steady progress. This was the case, not only in the United States, but also in other countries. Even in Germany, the growth of this movement has not been stopped by the efforts of National Socialism to make itself an exclusive interest, and by official restrictions on the activities of religious bodies.

Mary Baker Eddy founded the original Church of Christ, Scientist, in Boston, in 1879. Now the Christian Science denomination has spread to all countries where English is spoken and to other countries on all of the continents. Authorized Christian Science literature is published, to different extents, in 17 languages, including periodicals in English, French, German, Netherlandic, and Scandinavian languages; also, in Braille and Moon types.

In the United States and Canada, and to some extent in other countries, Christian Scientists have continued to make an increased use of radio as a means of making Christian Science correctly known to the public. This broadcasting has included church services, the Columbia Church of the Air, lectures, devotional programs, and transcriptions by qualified speakers. Likewise, *The Christian Science Monitor* has continued to develop its broadcast, "The Monitor Views the News," which consists of editorial comments on important news of general interest. *The Monitor* has also continued to develop as a newspaper.

The Christian Science denomination (Dec. 1, 1939) includes 2,851 churches and societies, besides many Christian Scientists living where local congregations are not yet organized. There are 2,175 churches and societies in the United States, 317 in Great Britain, 87 in Germany, and 272 in other countries, including those most distant from Boston (Australia, New Zealand, and South Africa). There are 70 Christian Science Organizations at colleges or universities, and 11,232 practitioners engaged exclusively in Christian Science practice.

Christmas Island: see STRAITS SETTLEMENTS.

Chromite. World production of chromite has more than quadrupled since the low point of 1932, expanding in 1937 by 36% to an estimated total of 1,300,000 metric tons but declining to 1,050,000 tons in 1938. Information on the trend of operations during 1939 is unusually scarce, but such as is available seems to indicate that during the first half of the year production was at an even lower rate than in 1938 in most of the leading countries, with the possible exception of Turkey and Cuba. These observations are confirmed by the rate of importation by consuming countries, which, so far as available, seems to be about 10% below that of 1938. There was a decided upturn in the third quarter in some areas, and unless the fourth quarter shows still greater demand, it would seem unlikely that the world total for 1939 could much exceed 900,000 tons.

World Production of Chromite
(Metric tons)

	1929	1932	1936	1937	1938
Cuba	53,799	500	71,086	94,592	40,200
Greece	24,214	1,555	47,400	52,600	35,000?
India	50,361	18,190	50,276	63,300	39,100
Japan	9,163	12,492	36,309	?	?
New Caledonia	52,594	69,429	47,839	48,022	52,200
Philippines	—	—	11,890	69,856	66,900
South Africa	63,974	19,371	175,700	168,600	183,600
So. Rhodesia	265,909	15,692	183,395	275,617	186,000
Turkey	16,178	55,196	163,880	192,508	208,400
U. S. S. R.	52,889	62,100	220,000	?	?
Yugoslavia	43,022	43,925	54,044	59,932	58,500
Total	635,200	298,500	1,068,000	1,300,000?	1,050,000?

The United States produces only a few hundred tons of chromite, but in 1937 imported 562,800 tons; in 1938 imports dropped to 357,700 tons, and in 1939 to 230,400 tons for the first 10 months. Germany seems to be the only one who was increasing imports during the first half.

(G. A. Ro.)

Chronology: see CALENDAR OF EVENTS, 1939, PAGES 1-18.

Churches, World Council of: see CHURCH REUNION.

Churchill, Winston Leonard Spencer (1874—), British states-

man, was born on November 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during the World War, see *Encyclopædia Britannica*, vol. 5, pp. 686-7.

Particularly after the union of Austria and Germany in March 1938 did Churchill become an outspoken opponent in Parliament of Prime Minister Chamberlain's conciliatory dealings with Germany and Italy. He was singled out by the German press and by Nazi officials for vitriolic attacks, and Hitler in several public speeches has called him "apostle of war" and "warmonger." When Britain took a firmer stand with Germany, Churchill pledged Chamberlain his political co-operation and praised the latter's efforts to form an anti-aggression bloc. In July and Aug. 1939 there was an increasing demand in the London press for his appointment to the cabinet. On September 3, a few hours after Britain's declaration of war, he entered the war cabinet as First Lord of the Admiralty, the same office he had held at the beginning of the World War. His first statement was a denunciation of the torpedoing of the "Athenia" as inhuman; whereupon Germany retorted that Churchill had probably secreted a bomb in the liner to sink it and thus influence American public opinion. Churchill did not bother to refute these charges, later repeated by Goebbels, but confined his public observations to the progress of Britain's

blockade and warfare on submarines. On October 1 he made a bid for Russia's friendship or neutrality, and praised Italy as a "great and friendly nation."

Church Membership. In the last Federal census, taken in 1926, some 212 separate and distinct religious bodies were listed in the United States. Since that time some few new groups have been organized, but there have been many dropped from the roll, and there have also been several mergers of the larger bodies. The roll for 1939 shows a reduction in number to 200 recognized bodies.

Economic and cultural pressure has accounted for some of the disappearances, while at the same time producing certain new "protest" churches or groups seeking an escape from the realities of the depression years. Under this head might be grouped such organizations as Father Divine's Peace Mission and The Church of the Firstborn of the United Sons of the Almighty. Cults with Oriental philosophies or theologies have had a slight increase; humanistic groups have slightly declined.

Progress toward merger is being made at the moment between the Presbyterians and the Protestant Episcopalians, and the United Brethren and Evangelical Churches. All signs point to the joining of these several bodies, though perhaps not in the near future.

The church and membership reports of the religious groups with memberships of 50,000 or over are as follows:

Denominations	Churches	Inclusive Membership
African M. E.	7,115	650,000
African M. E. Zion	4,205	597,785
American Baptist Assoc.	2,662	263,484
American Lutheran Conf.	6,001	1,441,348

Syrian Orthodox	69	61,043
Major Bodies as above	228,055	62,527,068
Other Minor Bodies	19,455	1,629,827
Totals Reported	248,410	64,156,895

(Table by courtesy of Rev. S. M. Cavert, Editor, *Year book of American Churches*.)

The overwhelming majority of religious people and church members in the United States, however, have shown a tendency toward fewer and stronger churches. Over 97% of the reported church and synagogue membership of the country is to be found

in 50 bodies having a membership of 50,000 each or more.

The largest single movement toward church union is to be found in the merging of the Methodist Episcopal Church (4,364,342 members), the Methodist Episcopal Church, South (2,822,516 members) and the Methodist Protestant Church (198,780 members) into a new Methodist Church having a membership of 7,385,638. (See also CHURCH REUNION.)

Church of England. Every aspect of the life and work of the Church of England, as indeed of the Anglican Communion as a whole, was affected by the outbreak of the war. The first nine months of 1939 had been a period of quiet, steady consolidation at home and of enterprising advance in new spheres abroad. The preparations which had been going forward to make 1940 a great missionary year had to be cancelled owing to the postponement of the Lambeth Conference of 1940. The church was confronted with new social, moral, and spiritual problems on a huge scale, and special efforts were devoted to the religious education of evacuated children, and to the providing of spiritual ministrations for the innumerable small groups of anti-aircraft and other troops scattered all over the country.

Apart from other war action, such as the postponement of all controversial business in the Church Assembly, other notable events and developments included good progress with the building of the new Church House, Westminster, and of the great new cathedrals of Guildford, Liverpool, and Blackburn while large extensions were added to the cathedrals of Sheffield and Portsmouth.

The £50,000 Church of England Appeal on behalf of refugees, which had been authorized by the Church Assembly at the autumn session of 1938, met with a generous response which resulted in the course of 1939 in a total of over £65,000.

After 38 years as Bishop of London, the Rt. Rev. Dr. A. F. Widdicombe retired. He was succeeded by Dr. G. F. Fisher, Bishop of Chester.

In the wider field of the Anglican Communion as a whole, mention must be made of the publication of *Partners*, the seventh unified statement of the work and needs of the church overseas, in which the new relationship of partnership which has grown up between the Church of England and its daughter provinces and dioceses overseas, was reviewed; of the historic decision of the Assembly of the Church of India to choose East Africa as its first field of foreign missionary work; and of the acceptance by the Convocations of Canterbury and York of agreements reached with the Lutheran Churches of Estonia and Latvia whereby "by economy" Anglican bishops may take part in the consecration of Estonian and Latvian bishops and Estonians and Latvians unable to receive the ministrations of their own clergy, may resort to the clergy of the Church of England.

Important recommendations were made by the theological faculty of the University of Athens to the Archbishop of Athens, and have been referred to the General Assembly of the Church of Greece. These recommendations included acceptance "by economy" of the validity of the Anglican Ordinations and that no Anglican minister should be reordained by the Church of Greece. These recommendations illustrate the new spirit of friendly *rap-prochement* which has increasingly and happily animated the Anglican and Orthodox Churches in their relations with each other. This spirit is itself significant of the great longing for the furtherance of reunion which is evident throughout all the provinces and dioceses; which was very evident at the World Conference of Christian Youth held at Amsterdam from July 24 to August 2 under the presidency of the Archbishop of York; and which is inspiring everywhere an increasing enthusiasm, especially in India and the other missionary churches overseas. (See CHURCH REUNION.)

(Ro. Sto.)

Church Reunion. In the field of Christian Unity, the most important development during 1939 was the decision to call the first meeting of the World Council of Churches in 1941 and to hold it in the United States. (See RELIGION.) This decision, made at Zeist in July 1939, now requires reconsideration in view of the outbreak of the European war. At a meeting of the North American Committee (see below), it was decided that while it would not be wise to attempt to hold the first meeting of the Council until the war was over, and all the churches could be represented, it was thought equally unwise to contemplate indefinite postponement.

It was therefore voted to approve the holding of the first meeting of the Council in the United States in 1941 or as soon thereafter as would be practicable.

In preparation for the World Council there was formed in Great Britain, a British Council of Churches which brings together under a single leadership the Church of England, the Church of Scotland and the Free Churches. In the United States, the Faith and Order and the Life and Work Movements are co-operating under a joint executive committee. A North American committee brings together for the purposes of consultation, all the churches of Canada and of the United States.

In the United States the movement for organic unity between the three leading Methodist Churches, the Methodist Protestant Church, the Methodist Episcopal Church South and the Methodist Episcopal Church, was finally consummated at the Uniting Conference held at Kansas City on May 10. The year 1939 also witnessed the completion of the union of the Evangelical and Reformed Churches which, in principle, was agreed upon some years ago.

Still more important, because having to do with the relation of churches of different polity, was a resolution adopted by the Protestant Episcopal Church at its convention in 1937, pledging it to seek organic unity with the Northern Presbyterian Church. Since then commissions of both churches have been studying the possibility of some intermediate Concordat which would permit ministers of each to serve congregations of the other on the approval of the local authority, Bishop or Presbytery as the case may be. A tentative draft, following lines originally suggested in 1936, was provisionally approved for discussion by a joint committee of both churches.

The proposals were warmly received by many in both churches but have been opposed by a small minority of the Presbyterian Church as well as by groups of Anglo-Catholics in the Episcopal Church. Bishop Parsons of San Francisco, the Chairman of the Episcopal Committee and Professor Robbins of the General Theological Seminary, have been among the chief advocates of the Concordat among the Episcopalians, while Bishop Manning of New York has been its most prominent opponent. (See also CHURCH OF ENGLAND.) (W. A. BR.)

Ciano, Costanzo (1876-1939), Italian statesman and admiral, was born of a noble family in Leghorn on August 30. He entered the Naval academy in 1891, graduated in 1896, and was promoted through the grades to admiral in 1923. He commanded several warships during the World War and was decorated nine times for distinguished service. His most notable naval exploit was at Buccari on Feb. 10 and 11, 1918, when he ran an entire squadron of torpedo boats through an enemy fleet, invaded the mined harbour and sank six Austrian vessels—a feat which made him a national hero. Count Ciano was first elected to the Chamber of Deputies in 1921 and the next year joined Mussolini in the march on Rome. From 1924 to 1934 he was minister of communications, resigning in the latter year to become president of the Chamber of Deputies. On March 11,

1939, Mussolini appointed him president of the new Chamber of Fasces and Corporations. From the very first stages of Fascist rule in Italy he was an intimate adviser of Il Duce, who was reported in 1930 to have selected the admiral as his political successor. Count Ciano was the father of Galeazzo Ciano, Italian foreign minister, who married Mussolini's eldest daughter, Edda, in 1930. He died at Ponte a Mariano, near Lucca, on June 26.

Civil Liberties. The year 1939 was a transitional one for civil liberties; many old scores were settled while the outlines of future struggles began to take shape. The State of California followed the release of Tom Mooney with the freeing of Warren K. Billings, who had been imprisoned on the same charge. The Supreme Court of the United States, in the case of the Committee for Industrial Organization and the American Civil Liberties Union against Mayor Frank Hague and his fellow officials of Jersey City, infused new life into the old civil rights statutes passed after the Civil War, opened the door of the Federal courts to cases involving deprivations of civil rights by State authorities, and made clear that the guarantees of free speech and free press included a right to use public places for speaking purposes and for the circulation of written matter. In the *Strecker* case, the same court held that previous membership in the Communist Party was not a ground for deportation under existing law. The court left open the more fundamental question of whether the fact that a person is a member of the Communist Party at the time of the deportation proceeding is a ground for deporting him.

In the birth control field, the Supreme Court refused to review the Massachusetts decision closing the clinics there. New cases are being planned, which it is hoped will persuade the Massachusetts courts and the Supreme Court that medically regulated contraception should not be interfered with. Countervailing the Massachusetts defeat was the new ruling of the Post Office department, permitting the free circulation of birth control information and supplies to druggists, as well as doctors; also, the launching by the State of North Carolina of a well-thought-out program of State supervised birth control.

In the field of censorship, the anti-censorship forces won a victory in New York when the Board of Regents reversed the action of the Board of Censors in banning the entirely unoffensive picture *Harvest*. Other films were less fortunate. *The Puritan*, based on Liam O'Flaherty's novel of the same name, was one of those which remained suppressed because of the action of the New York State board. Many others, including *Yes, My Darling Daughter*, were ordered cut by the censors as a prerequisite of their showing.

In the radio field, the code of the National Association of Broadcasters indicated at least an attempt to prevent propaganda being controlled by those who could buy most time.

At the end of 1939, indications are that the emergent civil liberties problem will be the protection of minority groups. The National Association for the Advancement of Colored People has brought a test case to determine whether the State of Maryland may legally pay to Negro teachers salaries lower than those paid to whites. Test cases as to the legality of poll taxes as a con-

dition of voting are in the courts. As yet the public is not aroused at the increasing deprivations of a fair trial by local prosecuting authorities. The Dies Committee continues to investigate so-called subversive activities and has brought to the attention of the public much information of value. Technical defects in the manner of its procedure, however, have created a divided public opinion as to whether its work so far is in aid of civil liberties or destructive of them. Much legislation to prevent libel on religious and racial groups is being framed by those incensed at anonymous propaganda issued by organizations stemming at least in philosophy from alien sources. (See also NEW JERSEY: *History*.) (M. L. E.)

Civil Population, Protection of: see CHEMICAL WARFARE.

Civil Service. Important gains for the merit system were recorded during the year 1939, balanced in part by losses in the States of Arkansas and Michigan. Three States adopted civil service laws for the first time, Minnesota, Rhode Island, Alabama; and New Mexico enacted legislation, not yet effective at the close of the year, for a substantial part of the State service. The number of States with state-wide merit legislation at the close of 1939 was sixteen. Massachusetts reorganized its Civil Service Commission; Vermont and Virginia established study commissions to investigate the desirability of State-wide merit laws.

While these improvements in the public service took place, the State of Arkansas repealed outright its civil service act of 1937, Michigan excluded from its merit system about one third of those who had originally been included, and Tennessee amended its civil service law to give the governor power, during 1939, to exclude specific positions from the classified service. These events indicate that the battle to extend the merit system in the States is likely to be marked by defeats as well as victories, although the tide is steadily moving toward the reduction of patronage.

Perhaps the most important extension of the merit system in the States will grow out of the amendments to the Social Security Act. Upon President Roosevelt's recommendation, this act was amended in 1939 to require the merit system in all State agencies co-operating in the administration of the law, in the following terms: A state plan must provide such methods of administration, including the establishment and maintenance of personnel standards on a merit basis, as the Board may prescribe, except that the Board may exercise no authority with respect to the selection, tenure of office or compensation of any individual employed in accordance with such methods.

This provision is effective Jan. 1, 1940. The Social Security Board, now a part of the Federal Security Agency, has already issued the basic requirements and minimum standards which it will accept. Practice by other agencies administering Federal grants has varied widely; the Bureau of Public Roads and the Children's Bureau illustrate Federal agencies which have refrained from requiring minimum personnel standards, while the U.S. Employment Service has required a formal, competitive examination for admission to State co-operating agencies. It seems probable that in future co-operative administration involving a Federal grant, the requirement of minimum personnel standards within the States will become established practice.

There were extensions of the merit system in county and city government during 1939, but not on a scale different from that of recent years. Among the more important local jurisdictions adopting civil service ordinances we note Atlanta, Georgia; Mobile, Alabama; and Atlantic City, New Jersey. In this connection the spectacular rehabilitation of the Los Angeles City Civil Service Commission represents an important advance.

During 1939 there were no large extensions of the merit system

in the Federal Government. Congress, however, again expressed its concern over the abuse of patronage and politics in administration by passing the Hatch Act, in principle a declaration of first importance. Among other prohibitions of the act we may note that it is made unlawful for any person employed in any administrative position by the United States to use his official authority to interfere with or affect national elections; for any person whatever to solicit political contributions from persons receiving relief or work relief; and no officer or employee of the Federal Government is allowed to take an active part in political management or in political campaigns. Provisions for enforcement are inadequate.

In the administration of the Federal service the year 1939 was one of unusual activity. The newly formed Council of Personnel Administration rapidly developed its work of co-ordination, stimulation, guidance and advice. Franklin D. Roosevelt appointed a distinguished career man, Dr. William H. McReynolds, to act in the dual capacity of Administrative Assistant to the President and Liaison Officer for Personnel. The Council, the Liaison Officer, a reinvigorated Civil Service Commission and about 30 recently established departmental personnel officers now form the solid foundation on which progress in personnel management in the Federal service seems assured.

On Feb. 1, 1939, the President appointed a special Committee of Inquiry whose principal task was to make recommendations concerning the professional, scientific and higher administrative officials of the Federal Government. In view of the special importance of the lawyers as a professional group, the President requested Mr. Justice Stanley Reed of the Supreme Court to act as chairman of the committee, to report early in 1940.

Two significant developments running through Federal, State, and local jurisdictions deserve special notice in summarizing the principal trends of 1939. The first of these is the rapid emergence of nationwide career opportunities in the field of personnel administration. During the year, nationwide examinations were held by the U.S. Civil Service Commission for director and assistant director of personnel at salaries ranging from \$4,600 to \$6,500; by Minnesota, Rhode Island and Wisconsin for director of civil service at salaries of \$6,000; by Seattle, Washington, for secretary and chief examiner at \$4,200 to \$4,620; by Los Angeles for five technical grades ranging from \$2,400 to \$4,620; by Buffalo, New York, and Portland, Oregon, for personnel officers of different grades.

The case of Portland is significant. There were 154 qualified applicants for junior personnel technician; the five States contributing the largest numbers were, in order, New York (37); Oregon (23); California (21); Washington, D.C. (12); and Michigan (9). These figures reveal a nationwide interest and also a national reservoir of competent technicians.

The second principal emphasis of the year was continued expansion of interest in and facilities for in-service training. The program of the George-Deen Act for Federal aid to local public service training was put in motion; the U.S. Department of Agriculture developed a comprehensive and forward-looking plan for the nearly 100,000 men and women in its ranks; the U.S. Civil Service Commission appointed a Director and Co-ordinator of Training to advise with the various Federal agencies; Mayor La Guardia organized in New York city a Council on Public Service Training. These are examples merely of a rapid evolution of training opportunities which are an integral part of the formation of a career service.

The concept of a career service continued to attract wide attention during 1939 and to make substantial gains within the protecting walls of the merit system. One aspect which was especially noteworthy was the number of career men in municipal and State administration who were attracted to the Federal Government.

The flow of talent is almost entirely upward, thus creating the possibility of a serious drain upon the administrative resources of the State and local governments.

Another aspect in 1939 was the rapidly increasing number of public employee retirement systems, stimulated in part by the general provision of old-age security under the Social Security Act. Increased emphasis is being placed upon State-wide retirement systems which also cover, either optionally or otherwise, the employees of the local subdivisions. This is probably the solution of the problem of public employee retirement systems for small communities. (L. D. W.)

Clairvoyance: *see* PSYCHICAL RESEARCH.

Clay. The clays of chief commercial importance include kaolin or china clay, ball clay, fireclay, bentonite, fuller's earth, and a number of others of minor importance; these are consumed in the production of a wide variety of products, such as pottery and stoneware, tile; terra cotta, refractories (firebrick, crucibles, glass pots, etc.), building brick and tile, and a host of others; in addition, clays are utilized in the manufacture of paper, rubber, linoleum, paints, cement, chemicals, plaster, and asbestos products, as well as in the filtering and decolorizing of oils, and in a number of other ways. Clay production in the United States totalled 4,464,000 short tons in 1937, and imports exceeded exports by 36,500 tons, but the 1938 output dropped to 2,902,000 tons, a decrease of 35%. Refractories of various kinds usually take 45-60% of the supply, ceramics 12-20%, paper 10-13%, filtering and bleaching oils and fats 7-8%, rotary-drilling mud 4-5%, and rubber and linoleum 2-3%. The production of clays of all kinds in Canada is so small as to be negligible, but there is a well established clay products industry which consumes something like 200,000 tons of imported clays. The clay industry of the United Kingdom is quite extensive, the output of low grade clays and shales amounting to 25,670,000 long tons in 1937; the higher grades included 2,739,000 tons of fireclay, 1,117,000 tons of china clay and ball clay.

For further details on bleaching clays *see* FULLER'S EARTH. (G. A. Ro.)

Cleveland, a city of North-east Ohio, occupies 73.74 sq.mi. with a population (1930) of 900,429, of which 597,603 were native whites, 229,487 foreign-born whites, and 71,899 Negroes. Estimated population in 1939, 948,730.

History.—In the non-partisan primary election October 3 two Republicans, Mayor Harold H. Burton and John E. O'Donnell, a member of the Cleveland Board of Education, were nominated to oppose each other in the mayoralty election. Two Democrats, William C. Dixon and Adam J. Damm, and a Communist, Mrs. Yetta Land, were defeated in the primary. Mayor Burton was re-elected on November 7, polling 141,858 votes to O'Donnell's 104,551.

Under the Burton administration Cleveland in the spring of 1939 was awarded a plaque by the United States Chamber of Commerce and the American Public Health Association for having the most effective program to meet health problems, and shared with Milwaukee the honours awarded by the National Safety Council for the "safest big city." The city in 1939 was setting a new record for fire prevention, the loss for the first eleven months of the year being only a trifle over \$500,000 as compared with \$1,998,000 for the same period in 1938 and the record, set in 1933, of \$846,644. The police department, in addition to its traffic safety campaign, reduced the city's major crime in 1939 to the lowest point in the 30 years the records have been kept. Partly respon-

sible for this record was the police department's two-way radio telephone system. In the first year it was in operation felonies were reduced about 20% and all major crime nearly 50%.

Many of the problems that faced the municipal administration in 1939 centred about the relief situation and the shortage of funds to handle it. (*See* OHIO). When the problem became acute late in November and early in December, and Gov. John W. Bricker refused to call a special session of the General Assembly, the situation was met by cutting relief rolls by one-quarter; reducing food allowances of the remainder by one-third; transferring funds that had been earmarked for other purposes; issuing bonds against delinquent taxes; and by action of the Federal Government in providing more Works Projects Administration jobs and carloads of food through the Federal Surplus Commodities Corporation.

Cleveland's city council throughout 1939 struggled with utility problems. Efforts to reach an agreement with the Cleveland Railway Co. on a new traction franchise failed, and under terms of the Tayler grant the company in January entered a 15-year liquidation period. Council's battle with the East Ohio Gas Co. for lower gas rates dragged on, but pending appeals and hearings the company won in the courts the right to increase its charges in Cleveland by about \$1,500,000 a year. Another rate battle is that between the council and the Cleveland Electric Illuminating Company. Council demanded a decrease in rates amounting to \$1,385,000 a year. The company refused to grant this and appealed to the State Utilities Commission.

Bishop Joseph Schrembs, head of the Cleveland Catholic diocese for 18 years, was elevated to the rank of archbishop by Pope Pius XII, March 30, 1939.

Education.—After restoring to teachers salary reductions that had been in effect through most of the depression, the Cleveland board of education in November found it had insufficient funds for the year. To prevent the schools from closing, the board delayed until 1940 payment of salaries of all its employees for the last six weeks of 1939.

Banking and Finance.—A development in Cleveland finance which attracted national attention was the fight waged by Otis and Co., Cleveland financial house, to establish the Middle West as an effective competitor of the East in financial underwriting. Leading a syndicate of banking houses, Otis and Co. bid for new issues of stocks and bonds of the Consumers Power Co., a Michigan subsidiary of Commonwealth and Southern Corp., and carried the fight to the Securities and Exchange Commission.

Trading on the Cleveland stock exchange was increased by two changes. On February 1 the daily trading period was lengthened one-quarter of an hour to 3:15 P.M. so the market was open later than eastern markets. In December, the Securities and Exchange Commission granted the request of the Cleveland exchange for unlisted trading privileges in 17 leading stocks.

Deposits in Cleveland banks on October 2 were \$819,977,066, the highest since the all-time peak was established in 1930. Two closed banks made liquidating dividend distributions in December. Depositors in the old Union Trust Co. received \$5,250,000, which was equal to 5% of deposits and brought the total paid to 85%. Depositors of the Standard Trust Co. also received a 5% payment, which amounted to \$370,000 and brought the total payment to 37½%.

Construction continued at a brisk pace in Cleveland through 1939. Erected with great speed, the \$7,000,000 Main avenue bridge across the Cuyahoga river was dedicated October 6 with ceremonies which were attended by a throng of 110,000. Work was begun on the \$3,300,000 Valley View housing project in May and on the \$3,000,000 Woodhill project in June, and the Cleveland Metropolitan Housing Authority announced that another housing group to cost \$1,000,000 would be built in Euclid, a suburb. Ground was

broken for the city's new \$6,500,000 generating station August 28, and the Cleveland Electric Illuminating Co. announced it would erect a \$6,300,000 power plant. On September 15 the cornerstone was laid for the new Central High school which will cost \$1,300,000.

Labour.—There were three outstanding strikes in Cleveland in 1939. Chain drug store clerks, pharmacists, warehouse and service employees walked out March 15 and this dispute was not settled until May 12. The Fisher Body plant was affected by the strike of the United Automobile Workers against the General Motors Corp., and a riot there July 31 sent nearly 50 persons to hospitals. Another U.A.W. strike took place in October at the Midland Steel Products Co., but lasted only a week. (P. By.)

Climate: see METEOROLOGY.

Clothing Industry. The clothing industry in 1939 recovered somewhat from the serious losses of 1938; production increased considerably. Spectacularly successful was sportswear with tremendous emphasis being placed on slack and shirt ensembles made of cottons, rayons, and worsteds. The trend toward comfort and ease in men's clothing continues unabated both in regular and sport clothing.

New machines appeared on the market including a new drilling machine for chalk marking, a high speed blind stitch machine, a newer and faster sewing machine and numerous special machines, all of which save hours of labour and turn out a neater, stronger product. Indications are for increased co-operation between textile mills, clothing manufacturers and retailers in an effort to supply the consumer with exactly what he desires. Synthetic fabrics are moving into the field with great rapidity. Reported are new laminated fabrics that require no weaving.

Competition between various types of closures has become intense; metal snap fasteners have entered the field to a rather generous extent, slide fasteners continue to drive ahead, button manufacturers are debating a campaign to educate the consumer.

Regular clothing manufacturers joined shirt and pants manufacturers in the slack and shirt ensemble business; work clothing houses likewise entered the sportswear field.

The European war has had an effect on the industry in many respects. Foreign textiles have lost much of their importance and American mills have decided to produce finer woollens. Importation of cotton has been curtailed and thread houses are unable to find the necessary Egyptian cotton. Foreign design influence is gone since foreign factories and designers have turned to military clothing. No volume of export business is reported.

Government regulation of the industry increased in 1939. Great discussion centres about proposed wage minimums, particularly in the cotton garment trade, where the Southern manufacturers have vigorously protested. Differentials between cotton and woollen operations are also bothersome.

Government research has been directed at the standardization of sizes for clothing, although no real practical formulae have yet been presented. A hip girth sizing system was proposed.

Up to and including Nov. 4, 1939, with about 60% (based on value) of the clothing industry reporting, total garments cut (including suits of wool, cotton, linen, mohair, trousers and knickers, overcoats, topcoats and separate coats, but not including dress pants, work clothes, shirts, leather garments, pajamas, and very heavy coats) in the men's, young men's and boys' industries totalled 26,461,375; a gain of more than 30% over 1938's period figure of 20,099,368 and comparing favourably with 1938's corrected full year figure.

English manufacturers had a good year as indicated by the rise of employment in the British industry. War activities have

changed British firms into primarily military uniform manufacturers. (H. SN.)

Cloves: see SPICES.

Coal Industry. Of a world total coal production estimated at 1,439,000,000 metric tons in 1938, 74% was concentrated in four countries: Germany 25%, United States 24%, United Kingdom 16%, and U.S.S.R. 9%. The comparative status of these major countries is shown in the accompanying graph. The second rank producers, 11 in number, controlled a total of 19%; France and Japan each had 3%, while Manchoukuo, which is under Japanese control, adds 1% to the latter; Poland, Czecho-Slovakia, Belgium, and India, ranging from 2.4% to 1.7%, averaged 2% each, although Czecho-Slovakia and Poland will now disappear as independent producers. South Africa, Netherlands, Canada, and Australia each had approximately 1%. This leaves 4% to be distributed among no less than 34 minor producers.

British Empire production is largely in Great Britain itself; the Empire total being 21%, with 16% in Great Britain, nearly 2% in India, about 1% each in South Africa, Canada, and Australia, there is only 0.6% remaining for other British territory; half of this is supplied by New Zealand, one-quarter by Southern Rhodesia, and the remainder by Malaya, Nigeria, Eire, and British Borneo.

Conditions are such (Jan. 1, 1940) that only a partial summary can be given on European producers during 1939, as statistics have been withheld in most cases since the outbreak of war.

Coal Production of the World
(Millions of metric tons—all grades)

	1929	1932	1936	1937	1938

World Reserves.—The reserves of coal, i.e. coal that can be worked at a profit, known in the world are approximately as under:

Anthracite	600,000 million tons
Bituminous	4,000,000 " "
Lignite	3,000,000 " "

In the larger coal-producing countries, the coal seams are mostly

"THE FIDDLERS THREE." Elderman's view in *The Washington Post* of the national coal strike in April and May 1939

of carboniferous age, but vast quantities of lower-grade coal, such as lignite and brown coal, are available in Germany, Russia, Central Europe and Asia.

The superficial extent of the coal areas of the world has been estimated at 605,000 sq.mi., or in the ratio of 1 to 110 of the land surface of the globe, about one-third belonging to formations newer than carboniferous. Coal is found in all latitudes between Spitzbergen and the Antarctic continent, and is of better quality as a whole in the Old World than in the New, and coal of the Northern Hemisphere is superior to that of the Southern.

United States.—A period of uncertainty over wage agreements during April and May cut bituminous coal production to one-quarter the usual weekly rate for six weeks, but most of this loss of output was offset by an increase of over one-quarter above the average rate during the last quarter, as a result of generally increased industrial activity. Bituminous production for the year was 389,025,000 short tons, an increase of 13% over 344,630,000 tons in 1938.

Anthracite production improved by only 10%, from 46,099,000 tons in 1938 to 50,807,000 tons in 1939. This gives a grand total of 439,832,000 tons for 1939, an increase of 12.5% over 390,729,000 tons in 1938. Bituminous production averaged 9,550,000 tons weekly during the last quarter, against an average of 7,500,000 tons for the year; weekly anthracite output in the last quarter was just on a par with the annual average, but from mid-April to mid-May was nearly 50% above the annual average.

Industrial consumption of bituminous coal dropped from 26,185,000 tons in January to 20,518,000 tons in May, with improvement to 30,246,000 tons in November.

Considering coal as a whole, Pennsylvania is the foremost producing State, but eliminating anthracite and comparing only on a bituminous basis, Pennsylvania has lost the leading position, and West Virginia has taken its place. These two States alone pro-

duce more than half of the total bituminous output of the United States.

Distributed by fields, about 70% of the bituminous output comes from the Appalachian region (Pennsylvania, Ohio, West Virginia, Virginia, Eastern Kentucky and Tennessee), 20% from the Central region (Indiana, Illinois, Iowa, Missouri and Kansas), 6% from the Rocky Mountain and Western States, and 3% from the Southern field (Alabama).

Although there is some international trade in coal, the amounts are so small that the United States industry is practically self-contained; imports are usually under 1,000,000 tons and exports have ranged from a high of 24,000,000 tons in 1929 to a low of 10,000,000 tons in 1932, including bunker coal and the coal equivalent of coke exported. (See also FUEL BRIQUETTES.)

Great Britain.—Coal production in 1938 dropped 6% to 227,015,000 long tons, 3% of which was anthracite and 97% bituminous. Exports took 57% of the anthracite and 15% of the bituminous output, with bunker coal taking another 5%. All told, including the coal in coke and manufactured fuels, about 22% of the output was exported.

Production to Aug. 5, 1939 totalled 144,021,000 long tons, an increase of 3% over the same period of 1938; this is at a rate of approximately 247,000,000 tons annually, as compared with 227,015,000 tons in 1938. Since it is probable that war has increased the demand, it is likely that the year's total may exceed the above estimate; in fact it is possible that it may approach or even exceed the 1929 high of 257,907,000 tons, although it must be remembered that losses in export and bunker trade may offset some of the gains in domestic consumption. Through Aug. 1939 exports had declined 5% from the 1938 monthly average, bunkers had increased by 2%, and exports of coke and manufactured fuels had dropped 30%; the total decrease was 5%. The chief loss in British exports will be that to Germany, which took 10% of the 1938 exports.

In spite of the increased output, employment in the industry continued to decline, and on Aug. 5, 1939 was 765,200, or 1.2% less than a year previous, which would indicate some improvement in output per man-shift, which averaged 22.96cwt. in 1938.

Due to the open character of many colliery structures, required by the work being carried on in them, the control of lighting under Air Raid Precautions regulations presented some difficult problems, and some of the schemes to overcome the difficulties are novel and interesting. For outside lighting, ultra-violet light was adapted by painting nearby objects with a fluorescent paint; the light itself is invisible to the eye, and while the fluorescence renders the painted objects clearly visible in the immediate vicinity, they are indistinguishable at a distance.

For indoor lighting, to avoid the necessity of blocking windows and using artificial light in daytime, yellow sodium light may be used for illumination, with the windows treated with a blue varnish; the complementary character of the two colours prevents the yellow light from penetrating the blue varnish, and being visible from the outside, while the varnish still has a sufficient

United States Production of Coal

transparency for sunlight to give a reasonable degree of illumination in daytime.

Germany.—German production in 1938 included 186,405,000 metric tons of bituminous coal and 198,511,000 tons of brown coal, a total of 384,916,000 tons, of which 366,764,000 tons were from Germany proper, 3,759,000 tons from the former Austria, and 14,393,000 tons from the Saar. Data available for 1939 are limited to bituminous coal for the first half, which was 94,062,000 tons, an increase of 2% over the same period of 1938. It is not clear whether this figure applies to the former area of the Reich, or to the current boundaries, but presumably the latter. Final figures for 1939 output may be expected to increase considerably above those for 1938, since they will include the former outputs of Czecho-Slovakia and Poland, which in 1938 were respectively 26,600,000 tons (about evenly divided between bituminous and brown coal), and 38,114,000 tons (practically all bituminous). The area now comprised in the new Reich had a total output of 449,630,000 tons in 1938, but this level can hardly have been maintained in 1939, for several reasons. It is a question as to what extent adverse effects on general consumption and export trade (which alone has been taking nearly 10% of the output) will be offset by increased demand by the war industries, but much more important is the extent to which sabotage and other related factors will have reduced the outputs in the former Czech and Polish mines.

Export trade is bound to suffer materially, as one-sixth of the past exports have been going to France. Another factor that will affect exports statistically is the extent of the trade that has in the past existed between Germany, Austria, Czecho-Slovakia, and Poland, most of which will now disappear from the export record, even though the trade itself still remains; this has amounted to a total only slightly less than the exports to France so that the total loss in recorded exports will reach considerable magnitude. Lack of ability to ship on the open seas will not seriously affect German exports, since the bulk of these has gone by land to European countries, or if by sea, to the Baltic countries. Less than 10% of the 1938 exports went outside the continent of Europe. In this connection it might also be well to mention that just as Germany will be cut off from imports from France, so also will she be barred from imports from Great Britain, which in the past has supplied large amounts of coal of grades lacking in Germany.

In the first partition Czecho-Slovakia lost to Germany about 54% of her former productive areas, including practically all of the brown coal, and another 21% was later lost to Poland; eventually, however, this latter went also to Germany, as well as the 25% still remaining at the final absorption of Moravia and Bohemia.

U.S.S.R. (Russia).—Russian production is estimated to have been 132,900,000 metric tons in 1938, 97,700,000 tons from European and 35,200,000 tons from Asiatic Russia. This was an increase of 5% over 1937. The division into types of coal has not been reported for several years, but is about 22% anthracite, 64% bituminous, and 14% brown coal. No data whatever are available on production in 1939. The Russian industry is practically self-contained, there being practically no imports, and very little surplus for export.

France.—French coal production is so far short of demand that imports amount to about one-half of production. The 1938 output included 46,502,000 metric tons of bituminous and 1,057,000 tons of brown coal, a total of 47,559,000 tons, and an increase of 5% over 1937; this was supplemented by imports of 18,705,000 tons of coal, 2,262,000 tons of coke and 1,034,000 tons of briquettes, equivalent to a total of about 23,000,000 tons of coal. During the first half of 1939 production rose to 26,014,000 tons, an

increase of 10% over the same period of 1938. Consumption remained practically unchanged, imports declining by about the same tonnage difference. In 1938 France imported 5,538,000 tons of coal, 985,000 tons of coke, and 242,000 tons of briquettes from Germany, and 1,570,000 tons of coal from Poland. This is equivalent to 8,825,000 tons of coal during the year from sources which are no longer available, and which must be made up from elsewhere.

Belgium.—Production in 1938 was 29,575,000 metric tons, a fractional decrease from 1937. The 1939 output seems to have been little affected by the war, as the October output was reported at 2,513,000 tons. Since 1936 imports have somewhat exceeded exports, but imports have been decreasing, and the import surplus for 1939 through August had shrunk to about 600,000 tons, from 4,200,000 tons in 1937.

Netherlands.—In 1938 the Dutch production dropped 5% to 13,659,000 metric tons, 99% of which was bituminous coal. Although Netherlands maintained imports in 1938 equalling 40% of production, exports were at a still higher rate, giving a 12% exports surplus, in addition to which a further 22% was used as bunker coal.

Canada.—Preliminary figures for 1939 show an increase in coal output to 15,507,000 short tons, as compared with 14,295,000 tons in 1938, a rise of 8%. Imports amount to almost as much as production, increasing in 1939 in a somewhat smaller proportion.

India.—Production in 1938 rose by about 10% to 29,000,000 long tons.

South Africa.—Production in 1938 increased 5% over 1937, to 17,950,000 short tons. Sales for the first three quarters of 1939 were 13,697,000 tons, or at the rate of 18,263,000 tons for the year.

Australasia.—The coal output of Australasia totalled 17,578,000 long tons in 1938, a decrease of 1% from 1937; of this, 88% was from Australia and 12% from New Zealand; the total included 72% of bituminous coal, and 28% of brown coal.

(G. A. Ro.)

Coast Guard, U.S. The activities of the United States Coast Guard in 1939 dealing with the saving of life and property may be summarized by stating that there were 9,383 instances of lives saved and vessels assisted, this being 658 more instances than during 1938; the total value of the vessels assisted, including cargoes, was \$63,723,566, and the number of persons on board the vessels assisted was 32,645. There were 10,615 instances of lives being saved or persons being rescued from peril, and an additional 4,858 instances where assistance of one form or another was rendered.

In carrying out its functions as the Federal maritime police agency and its duties of law enforcement, the Coast Guard boarded and examined the papers of 32,655 vessels, and it seized 6 vessels. The fines and penalties incurred by vessels reported amounted to \$470,081. Coast Guard vessels removed or destroyed 266 derelicts; they patrolled 443 marine parades and regattas; and Coast Guard officers examined 3,495 persons for certificates as life-boat men.

In the hurricane which struck the New England coast in Sept. 1938 the Coast Guard rendered assistance with all equipment available, rescuing 1,011 persons from positions of peril, and aiding 509 vessels. Emergency radio communication was provided, mail was transported, vessels and automobiles were recovered, and aerial surveys made. Three members of the service lost their lives incident to rescue activities.

The Coast Guard provided an armed detail for the guarding and supervision of the transfer of approximately 77,000,000 lb. of silver bullion by the Treasury Department from New York city to

AFTER TAKING ABOARD a ship's passenger stricken with pneumonia, this U.S. Coast Guard plane fell into the Atlantic July 15, 1939, killing both pilots and the sick man. Five others in the plane were rescued by the ship's crew

the depository at West Point, N.Y. Coast Guard cutters maintained the International ice patrol on the North Atlantic during the iceberg season, a duty to which they have been assigned since 1913, and while on this duty co-operated with the Weather Bureau in the study of the upper air conditions as a means of promoting greater safety in air navigation.

Under President Roosevelt's Reorganization Plan No. II, the Lighthouse Service, of the Department of Commerce, was transferred to and consolidated with the United States Coast Guard, in the Treasury Department. This consolidation, made in the interests of efficiency and economy, resulted in the transfer of the system of approximately 30,000 aids to marine navigation, including lighthouses, lightships, radiobeacons, fog signals, buoys and beacons. These aids are maintained upon the sea and lake coasts of the United States, on the navigable rivers of the country, and upon the coasts of all other territory under the jurisdiction of the United States with the exception of the Philippine islands and the Panama canal proper. Plans were in progress at the close of the fiscal year providing for a complete integration with the Coast Guard of the personnel of the Lighthouse Service, numbering about 5,200.

(R. R. W.)

Coast Guard Academy, U. S. During the calendar year 1939, the United States Coast Guard Academy, which is maintained for the professional education of young men who are candidates for commissions as officers in the Coast Guard, graduated 23 cadets who were commissioned ensigns in the Coast Guard on May 23, 1939. The annual competitive examination of applicants for appointment as cadets at the Coast Guard Academy for the class of 1943 was held on June 14, 1939. Of the 1,189 applicants who competed in this mental examination, 257 were successful in passing. In Aug. 1939, 88 appointments as cadets were made from those standing highest as a result of this examination.

In Sept. 1939, the Coast Guard was called upon to maintain a strict neutrality patrol as the result of the unsettled conditions in Europe. To carry out the enforcement of the neutrality laws, it became necessary to augment the personnel of the Coast Guard, and in anticipation of a continuing need, the class of 1943 was in-

creased at that time by 36 additional appointments. At the close of the year, the Coast Guard Academy had 207 cadets under instruction, the largest cadet corps in the history of the academy. This number included 21 in the first class, 25 in the second class, 39 in the third class, and 122 in the fourth class.

In its endeavour to improve constantly the curriculum at the academy, Professor H. L. Seward of Yale university, recognized as an outstanding authority in maritime matters, was appointed on Feb. 20, 1939, as head of the Department of Maritime Economics, this course assuming particular importance as officers of the Coast Guard now administer the United States Maritime Service, an organization training merchant officers and seamen of the American merchant marine. Two additional instructors were also added to the staff of the academy as the result of the increase in the cadet corps.

The annual visit to the Coast Guard Academy by the Congressional Board of Visitors, required by law, was made on April 20, 1939. The board, which was composed of three Senators and four Congressmen, was very favourably impressed with the academy and the administration thereof, and found it to be a thoroughly modern educational institution of high standards.

In a manner analogous to the practice at the United States Naval Academy, the Coast Guard cadets of the first and third classes made the annual practice cruise during the months of June, July, and August aboard the Coast Guard Cutter "Bibb" to a number of ports on the western coast of South America. The cadets of the second class made a similar cruise to ports in New England and eastern Canada.

Coaxial Cables: see TELEPHONE: *Coaxial Cable.*

Cobalt. There was no great commercial importance attached to the metal cobalt until the early years of the nineteenth century, when extensive deposits were discovered in Ontario (Canada), which yielded a plentiful supply of a metal heretofore obtained only in small quantities as a by-product in the smelting of other metals, and stimulated the development of new uses. For a time Canada supplied most of the world's demand, but more recently even more extensive deposits have been discovered in Northern Rhodesia, Belgian Congo, and French Morocco. Canada produced 209 metric tons in 1938, and Northern

Rhodesia 1,461 tons. Cobalt is now produced to the extent of some 3,000 metric tons annually, about half of which is used as metal, and the other half in compound form. The chief metal use is in the so-called stellite alloys, combinations of cobalt and chromium, with sometimes other metals added, and in special alloy steels, mainly for permanent magnets. The main compound utilized is the oxide, which has long been used as a blue colouring agent in the glass and ceramic industries, while smaller amounts of other compounds are used as driers in paint and varnish.

(G. A. Ro.)

Cochin-China: *see* FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). Exports of principal cocoa-producing countries are given by the International Institute of Agriculture as follows for the 11 months from Oct. 1, 1938, to Aug. 31, 1939, and for the similar period ending Aug. 31, 1938:

Cocoa Exports from Principal Producing Countries
(in Thousands of Pounds)

	11 mos. to Aug. 31, 1939	11 mos. to Aug. 31, 1938
Gold Coast	610,347	469,399
Nigeria & Cameroon	241,017*	200,339*
Brazil	195,961†	188,256†
Ivory Coast	102,533†	100,392†
Cameroon, Fr.	63,396†	50,755†
Dominican Republic	52,060†	34,421†
Ecuador	28,067†	29,866†
Sao Thomé & Principe Islands	20,501*	21,215*

†Oct. 1 to June 30, of year noted.

†Oct. 1 to May 31, of year noted.
(S. O. R.)

Coco-Nuts. World production of coco-nuts, in copra equivalent, is approximately 7,333,000,000lb. a year, the United States Department of Commerce reported in 1939 in its regular consular advices on food production and trade throughout the world. Of this, 22% is produced by the Philippine Islands, 25% by Netherlands Indies, 18% by British India, 9% by Ceylon, and 8% by Malaya. Practically all coco-nut oil and copra imported into the United States is from the Philippines, owing to the fact that excise taxes on such products are rebated back to the Philippine Government by the United States, thus giving the Philippines an advantage. Imports of coco-nut oil into the United States approximate 350,000,000lb. annually; copra, about 500,000,000 pounds. Coco-nut oil and copra are included in the vegetable oils, of which the British Food Ministry took complete charge following the outbreak of war in September, to safeguard supplies of cooking fats and to prevent wide fluctuations in prices. In Jamaica, exports of copra and oil were prohibited, at the outbreak of war, to conserve the supply of oil for manufacturing oleomargarine, cooking fats and soap and to do away with the necessity of importing those products. In the Netherlands Indies early in 1939 the governor general announced an ordinance to prevent natives of Celebes from losing their coco-nut plantations as a result of binding themselves by contracts with copra dealers.

Coffee. The outbreak of war Sept. 1939, with its loss and curtailment of coffee markets, so demoralized the foremost industry of Brazil, coffee production, that the Government declared a four-day holiday as an antidote to panic psychology. Immediately, however, orders for coffee flowed into Brazil, owing

to the announcement of steamship companies that cargo rates would be advanced approximately 25% on October 1 because of war risks. September shipments of coffee from Brazil were 1,575,315 bags, the largest monthly shipment in many years. Heavy war-scare buying also caused reshipments of coffee from the United States to Scandinavian countries and Italy. Germany imported 1,529,828 bags of coffee in 1938. War blockade closed that market to Brazil. Coffee substitutes, known as "60-40s," were in use in Germany some months before the outbreak of war. Coffee shippers in Sept. 1939 were in a much better position than at the beginning of war in 1914, as they had only about 2,700,000 bags of coffee in Europe in 1939, whereas in 1914 they had approximately 8,000,000 bags, much of which was confiscated. As a result of war restrictions on credit the Venezuelan Government announced a loan of 4,000,000 bolivares (\$1,260,000) to coffee planters. The National Coffee Department in Brazil has arranged war risk insurance. Indemnities are to be paid in coffee, taken from the annual surplus that otherwise would be destroyed to keep it off the market. From June 1931 to June 15, 1939, Brazil destroyed 66,434,000 bags of coffee in its national coffee control program. Exports from Brazil for the crop years ending June 30, were 16,384,286 bags in 1939 and 14,616,289 bags in 1938 (bags of 60 kilos each). World deliveries of coffee for the crop years ending June 30, 1939 and 1938, were reported by the New York Coffee and Sugar Exchange as follows, in bags of 132lb. each:

	1939	1938
	bags	bags
World	26,727,107	25,471,714
United States	13,817,107	12,564,714
Europe	11,508,000	11,517,000
Elsewhere	1,312,000	1,390,000

Canada on September 12 imposed a war revenue tariff of 10 cents a pound on imports of coffee grown in British possessions, which previously had been admitted duty free. Coffee from other countries, which had under favoured nations' agreements paid a duty of 3 cents a pound, was raised to a duty of 13 cents a pound. Canada imports about 40,000,000lb. of coffee annually. (*See also* BRAZIL; GUATEMALA.)

Coiffures: *see* FASHION AND DRESS.

Coinage. The United States Mint service is an adjunct of the Treasury Department. It consists of eight field institutions in widely scattered localities, administered by the Director of the Mint, from the Bureau of the Mint in Washington. The eight institutions are three coinage mints, located in Philadelphia, Pa., Denver, Colo., and San Francisco, California; assay offices in New York, Seattle, Wash., and New Orleans, La.; a bullion depository for storage of gold, at Fort Knox, Ky., and a bullion depository for storage of silver, at West Point, New York.

Coinage.—Coinage manufactured by the U.S. Mints for the United States during the calendar year 1939, amounted to 674,089,105 pieces, valued at \$38,289,169.80.

Half dollars	13,655,934 pieces
Quarter dollars	43,268,795 pieces
Dimes	102,683,321 pieces
Nickels	130,771,535 pieces
Cents	383,709,520 pieces

The nickel was the Jefferson design, adopted in 1938; it superseded the Buffalo nickel, which, however, continues in circulation.

All Mint records for monthly coinage in the United States, were broken in Oct. 1939, when 126,977,909 pieces were struck, the largest production in any one month since the founding of the Mint in 1792. November production was the second largest in Mint history, reaching 124,242,518 pieces.

Coinage executed for foreign Governments amounted to 15,725,-

ooo pieces. The U.S. Mints, in 1939, executed coins for Cuba, the Dominican Republic, and Honduras.

Gold and Silver Acquisitions.—Gold acquisitions by the Mints and Assay Offices of the United States, during the calendar year 1939, amounted to approximately \$3,132,000,000. Silver acquisitions of the Mints and Assay Offices of the United States in 1939 amounted to 343,620,000 ounces (approximate). (N. T. R.)

Coke. The production of coke centres in the more heavily industrialized countries, particularly those with a large pig iron output. World production, including both oven coke and gas-house coke, increased about 11% in 1937, to an estimated 191,000,000 metric tons, the approximate distribution being: United States 28%; Germany 25%; United Kingdom 15%; U.S.S.R. 11%; France 5%; Belgium 3%; Japanese Empire 2%; Netherlands 2%; Czechoslovakia 2%; India, Canada, Poland, and Italy 5%. Figures are incomplete for 1938, but there was a decrease of probably about 10%, most of which was in the United States.

The United States produced 32,633,000 short tons of oven coke in 1938, of which 98% was by-product and 2% beehive; this is a decrease of 38% from 1937. Of the total, 55% was used in the production of pig iron and ferro-alloys. Production recovered somewhat in 1939, the output for the first 10 months being 14% above that for the corresponding period in 1937. Foreign trade plays very little part in the industry, exports and imports each being of the order of 1% of the output. Coke production took 14% of the bituminous coal production of the United States in 1937, aside from that used in gas works.

After the United States, Germany is the next largest producer of coke; in 1938 oven coke increased 6% to 43,511,000 metric tons; in addition, gas works coke is approximately 5,000,000 tons, and brown-coal coke 2,000,000 tons. Germany is a heavy exporter of coke, but net exports in 1938 took only 12% of the output, as against 20% in 1937.

Coke production increased 6% in the United Kingdom in 1937, to 29,045,000 long tons; gas-house coke is much more important there than in other countries, making up 45% of the total, while by-product coke is 54%, leaving 1% for beehive ovens. Coke production consumed 13% of the bituminous coal output in 1937. Coke exports were 2,450,000 tons, or 8% of the total output.

Colchicine: see HORTICULTURE.

Cold, Common. Variation in individual resistance is recognized as an important factor in the acquisition of the common cold. Locke made more than 1,000 tests on healthy students observing the oxygen-use under standard exertion and recorded the incidence of colds in the same subjects. He then compared the efficiency of performance with the frequency of reported colds. He succeeded in demonstrating a correlation between the ability to avoid the common cold in man and the ability to maintain a capacity for good response to effort and exposure, which had previously been shown to indicate maximal ability to resist infection in the rabbit. It was therefore suggested that the causal agent in the common cold may be capable of precipitating onset most readily when normal defence has been made temporarily vulnerable as the result of fatigue.

Most of the latest articles on vaccines for prevention of colds have continued to reflect unfavourable views. As the result of an army study, Blich and Doyle concluded that cold vaccines as today available do not prevent colds or their complications, nor do they cut down on the duration or severity of the illness to any appreciable extent. Hauser and Hauser in a controlled study of students at the University of Michigan, with the subjects

divided into three groups, found that over 66% of those subjects who received sterile water instead of vaccine stated they had fewer colds than during the preceding year. Over 64% of those who had received the vaccine intradermally similarly considered themselves improved, and 80% of those who received the vaccine subcutaneously reported a like effect. Although the report of improvement was greater in the group receiving the vaccine subcutaneously, the percentage difference was within the limits of possible error.

An attempt was made by a large industrial concern to estimate the value of some current methods of cold prophylaxis on over 1,600 employees. The only method found of any value was ultra-violet irradiation (sun lamp) which, it was believed, reduced both the severity and the number of colds in the employees so treated. Cathartics are still frequently given for colds, but in an army study no evidence was obtained that either castor oil or magnesium sulphate shortened the duration of acute upper respiratory disease, and in fact these drugs appeared to prolong recovery. No striking new local treatment has been discussed. The tendency is to return to general measures as outlined by Bock: "Common-sense treatment of acute upper respiratory tract infections, including the common cold, with or without fever, requires bed care, a return to the principle established by Hippocrates. Time, trouble, and money will often be saved by the early institution of this method. Whatever the specific etiological factors may be, it appears clear to us that fatigue of body and mind in adult patients plays a role in the precipitation of these infections not generally recognized. The main principle of treatment should be rest."

Collier, Barron (1873–1939), U.S. advertising executive, was born March 23 in Memphis, Tenn., and was educated in the public schools of Memphis and at Oglethorpe university, Atlanta, Georgia. In 1890 he joined an advertising firm in Memphis. Ten years later he moved to New York city, where he organized his own company. At the time of his death he was president of 14 advertising companies and real estate brokerages and was reputedly the largest land-owner in Florida. The best known of his organizations was Barron G. Collier, Inc., brokers for advertising space in the cars of many municipal transportation systems. Collier, who was decorated by seven foreign nations, died March 13 in New York city.

Colombia, a republic in northern South America bordering both the Pacific and the Caribbean; language, Spanish; capital, Bogota; president, Eduardo Santos; area, 448,794 square miles. The population according to the census of April 1938 (made public in 1939), is 8,724,839. The principal cities are: Bogota, 331,400; Medellin, 170,622; Barranquilla, 152,348; Cali, 110,579; Cartagena, 86,197; Manizales, 83,346; Ibague, 61,860; Cucuta, 57,251; Bucaramanga, 49,891; Pasto, 49,533; Neiva, 34,699; Santa Marta, 33,163; Popayan, 24,479; Tunja, 20,417. The areas of densest population are the eastern Andean plateau, the interior departments of Antioquia and Caldas, and the upper Cauca valley.

History.—In 1939, under the administration of President San-

Rhodesia 1,461 tons. Cobalt is now produced to the extent of some 3,000 metric tons annually, about half of which is used as metal, and the other half in compound form. The chief metal use is in the so-called stellite alloys, combinations of cobalt and chromium, with sometimes other metals added, and in special alloy steels, mainly for permanent magnets. The main compound utilized is the oxide, which has long been used as a blue colouring agent in the glass and ceramic industries, while smaller amounts of other compounds are used as driers in paint and varnish.

After the United States, Germany is the next largest producer of coke; in 1938 oven coke increased 6% to 43,511,000 metric tons; in addition, gas works coke is approximately 5,000,000 tons, and brown-coal coke 2,000,000 tons. Germany is a heavy exporter of coke, but net exports in 1938 took only 12% of the output, as against 20% in 1937.

Coke production increased 6% in the United Kingdom in 1937, to 29,045,000 long tons; gas-house coke is much more important there than in other countries, making up 45% of the total, while by-product coke is 54%, leaving 1% for beehive ovens. Coke production consumed 13% of the bituminous coal output in 1937. Coke exports were 2,450,000 tons, or 8% of the total output.

Cold, Common. Variation in individual resistance is recognized as an important factor in the acquisition of the common cold. Locke made more than 1,000 tests on healthy students observing the oxygen-use under standard exertion and recorded the incidence of colds in the same subjects. He then compared the efficiency of performance with the frequency of reported colds. He succeeded in demonstrating a correlation between the ability to avoid the common cold in man and the ability to maintain a capacity for good response to effort and exposure, which had previously been shown to indicate maximal ability to resist infection in the rabbit. It was therefore suggested that the causal agent in the common cold may be capable of precipitating onset most readily when normal defence has been made temporarily vulnerable as the result of fatigue.

Most of the latest articles on vaccines for prevention of colds have continued to reflect unfavourable views. As the result of an army study, Blicht and Doyle concluded that cold vaccines as today available do not prevent colds or their complications, nor do they cut down on the duration or severity of the illness to any appreciable extent. Hauser and Hauser in a controlled study of students at the University of Michigan, with the subjects

divided into three groups, found that over 66% of those subjects who received sterile water instead of vaccine stated they had fewer colds than during the preceding year. Over 64% of those who had received the vaccine intradermally similarly considered themselves improved, and 80% of those who received the vaccine subcutaneously reported a like effect. Although the report of improvement was greater in the group receiving the vaccine subcutaneously, the percentage difference was within the limits of possible error.

An attempt was made by a large industrial concern to estimate the value of some current methods of cold prophylaxis on over 1,600 employees. The only method found of any value was ultra-violet irradiation (sun lamp) which, it was believed, reduced both the severity and the number of colds in the employees so treated. Cathartics are still frequently given for colds, but in an army study no evidence was obtained that either castor oil or magnesium sulphate shortened the duration of acute upper respiratory disease, and in fact these drugs appeared to prolong recovery. No striking new local treatment has been discussed. The tendency is to return to general measures as outlined by Bock: "Common-sense treatment of acute upper respiratory tract infections, including the common cold, with or without fever, requires bed care, a return to the principle established by Hippocrates. Time, trouble, and money will often be saved by the early institution of this method. Whatever the specific etiological factors may be, it appears clear to us that fatigue of body and mind in adult patients plays a role in the precipitation of these infections not generally recognized. The main principle of treatment should be rest."

Collier, Barron (1873–1939), U.S. advertising executive, was born March 23 in Memphis, Tenn., and was educated in the public schools of Memphis and at Oglethorpe university, Atlanta, Georgia. In 1890 he joined an advertising firm in Memphis. Ten years later he moved to New York city, where he organized his own company. At the time of his death he was president of 14 advertising companies and real estate brokerages and was reputedly the largest land-owner in Florida. The best known of his organizations was Barron G. Collier, Inc., brokers for advertising space in the cars of many municipal transportation systems. Collier, who was decorated by seven foreign nations, died March 13 in New York city.

Colombia, a republic in northern South America bordering both the Pacific and the Caribbean; language, Spanish; capital, Bogota; president, Eduardo Santos; area, 448,794 square miles. The population according to the census of April 1938 (made public in 1939), is 8,724,839. The principal cities are: Bogota, 331,400; Medellin, 170,622; Barranquilla, 152,348; Cali, 110,579; Cartagena, 86,197; Manizales, 83,346; Ibague, 61,860; Cucuta, 57,251; Bucaramanga, 49,891; Pasto, 49,533; Neiva, 34,699; Santa Marta, 33,163; Popayan, 24,479; Tunja, 20,417. The areas of densest population are the eastern Andean plateau, the interior departments of Antioquia and Caldas, and the upper Cauca valley.

History.—In 1939, under the administration of President San-

tos, Colombia continued the progressive development instituted under his predecessors. Politically, the most outstanding event was the decision of the Conservative Party to resume active participation in politics after an abstinence of nearly nine years. The marked freedom of the press and the willingness of the politically dominant Liberal Party to tolerate criticism and opposition gave promise of a continuance of Colombia's record, unique in Latin America, of constitutional government and unbroken acquiescence in the verdict of the ballot box for over a third of a century.

The country showed notable progress in internal development in 1939. An extensive program of asphaltting the nation's trunk highways was begun. Completion of extensive harbour works at Barranquilla, the principal port, just inside the mouth of the Magdalena river, made possible for the first time the unloading there of ocean-going vessels instead of at Puerto Colombia seven miles away on the sea. Much-needed waterworks were put into service in Bogota and in Cartagena. Dwarfing all else in internal development, however, was the completion of a 263-mi. pipe line connecting the rich Barco concession, one of the world's greatest oil fields, with the new port of Covenas on the Caribbean. This completed an epic engineering battle during which 12-in. pipe, much of it transported by air, was laid through a 5,284-ft. pass in the Andes and across the steaming jungles of the Catatumbo and Magdalena basins, part of the way in the face of attack by the fierce and primitive Motilón Indians. An original daily delivery of 25,000 bbl. of oil at Covenas will eventually be increased, it is planned, to 70,000 bbl. a day.

Throughout 1939 Colombia continued to maintain the friendly relations with the United States which had characterized her foreign policy for over a decade. President Santos' formal declaration for closer co-operation with the United States and other American nations was enthusiastically supported in congress and in the press, despite some fears that the Roosevelt Good Neighbour Policy, which Colombia has thoroughly approved, might be adversely affected by subsequent political changes in the United States. Conversely, there was general opposition to the program of the totalitarian nations, and especially to their activities in the Americas.

With the outbreak of war in Europe, Colombia took steps to defend her interests and her neutrality. On September 5, radio stations were ordered to broadcast only in Spanish and to observe strict neutrality in news presentation. In October, partly at the instigation of the United States, and motivated mainly by considerations of Panama canal defence, Colombia formally nationalized the German-controlled German-Colombian Air Transport Co. (the "Scadta"), oldest commercial air transport system in Latin America, which had employed German reserve officers as pilots. The Colombian Government's action resulted in the formation of the Colombian Air Navigation Co., directed by a Colombian and staffed by North American and Colombian pilots. The close co-operation of Colombia and the United States in military and naval matters was further marked by the visit (in April) of five Colombian officers to the Panama canal, where they virtually became part of the American military organization during a week of observation. An outstanding development of 1939 in Colombia's relations with her Latin American neighbours was her move to raise her legation in Ecuador to the rank of embassy. Ecuador, whose relations with Colombia had been extremely cordial, reciprocated.

Education.—In 1937 there were 8,714 primary schools (enrolment 573,617), largely supported by the national or local Governments; and 436 secondary (enrolment 32,585), over 80% of them privately controlled, although with Government financial assistance and determination of standards. There are several universities of which the National university, at Bogota, and the Univer-

sity of Medellin are the most important.

Finances.—The monetary unit is the peso (value: 58 cents U.S.). A scheduled \$8,000,000 loan to Colombia was held up by the U.S. Export-Import Bank because Colombia had not resumed service on that part of its external debt held in the United States. Colombia attributed this failure not to unwillingness on her part to resume payments, but rather to her inability to reach a satisfactory agreement with economy as a result of the outbreak of the European war in September.

Trade and Communication.—Colombia has external communication by sea mainly through Cartagena, Barranquilla, and Santa Marta on the Caribbean, and through Buenaventura and Tumaco on the Pacific, and by international air transport. Highways connect the country with its neighbours Venezuela and Ecuador. Air transport is very important in internal communication, due to the inadequacy of land routes from the coast to the main centres of population. In 1937, 4,260 mi. of highway were in operation. Railroads in operation totalled 1,984 miles. Three short aerial cable-ways for the transport of freight and passengers measured 88 miles. The Magdalena river remains an important artery of commerce, despite difficulties of navigation during the dry season.

In 1938, imports (largely textiles and other manufactured goods) totalled 159,259,000 pesos (6.1% loss from 1937), with the United States leading (46.9%), followed by Great Britain and Germany. Exports were 168,637,000 pesos including 18,780,402 in gold bars (a decline of 8.4% from 1937), with the United States taking 59%, followed by Germany (17.3%), and Great Britain (12.3%). In 1937 coffee comprised 55.8% of all exports, petroleum 22.1%, gold 11.1%, bananas 5.2%, and hides 2.3%. In 1939, there was a considerable increase in petroleum exports; while the extensive oil development clearly increased the importation of machinery and manufactured goods. Colombia avoided serious disruption of her economy as a result of the outbreak of the European war in September because of her predominant commercial connections with the United States. Colombian trade with Germany ceased completely, and the United States tended to absorb it as well as most of the other belligerents' shares.

Agriculture and Mineral Production.—In addition to the principal agricultural exports, Colombia produces sugar, wheat, rice, cotton, cacao, and tobacco, largely for domestic consumption. The pastoral industry produces annually about 3,000,000 pesos value of hides for export. Mineral resources are extensive. Colombia is ninth in world petroleum production (22,998,000 bbl. in 1939, 21,660,720 in 1938). In platinum she is second, and first in emeralds, while gold also is mined in considerable quantity. Manufacturing for domestic consumption has advanced under the protective tariff policy, and employs 300,000 persons.

(L. W. BE.; J. F. KL.)

Colorado, a Rocky Mountain State of the United States, popularly known as the "Centennial State," admitted to the Union 1876; area 103,658 sq.mi., one-third occupied by mountains; population (1930) 1,035,791 and estimated (1937) at 1,071,000; equally divided between urban and rural; 961,117 whites, 57,676 Mexicans, 11,828 Negroes, 1,395 Indians, other races 3,775; native-born whites 875,711, foreign-born whites 85,406. Capital and largest city, Denver, 287,861.

History.—State officers are: Ralph L. Carr (R.), governor; John C. Vivian (R.), lieutenant-governor; George E. Saunders (D.), secretary of State; Homer F. Bedford (D.), State auditor; Charles M. Armstrong (R.), State treasurer; Byron G. Rogers (D.), attorney-general; Mrs. Inez Johnson Lewis (D.), State superintendent of public instruction. In the 32nd General Assem-

bly, adjourned in April 1939, the Senate was Democratic and the House Republican. Principal legislative measure with political significance was the diversion of a portion of income tax receipts into the State general fund to offset demands of public assistance program, such receipts having previously gone to school fund.

Public Assistance.—In Jan. 1939, 57,587 cases were receiving public assistance (pensions, aid to dependent children, aid to the blind, tuberculous hospitalization, and direct relief), the cost of these agencies during 1938 having been over \$18,000,000, including \$6,710,000 in Federal grants. The number receiving old-age pensions increased from 34,604 at the beginning of 1938 to 39,369 in Sept. 1939. Although the pension amendment, twice upheld by popular vote, provides for \$45 a month, the average of 1938 payments was \$29.99, due to insufficient income. Colorado's pension payments are the second highest in the United States.

Water Development.—In 1939 one large storage reservoir was completed and two others were well under way, all designed to store surplus flood waters for late summer irrigation. A \$44,000,000 project for the diversion of Colorado river waters through a 13-mi. tunnel to supplement the flow of the South Platte through rich irrigated areas was commenced, and on the lower Arkansas river, near the Kansas line, a flood-control project to cost more than \$10,000,000 was inaugurated.

Highways.—In 1939 the State completed its \$25,000,000 highway program, financed by the issuance of anticipation warrants against future gasoline tax collections. Including Federal aid, construction total for 1938 was \$13,676,000 and for 1939, \$9,009,000. Although tremendously advanced, the program of essential highway construction is not yet considered complete.

Public Buildings.—Largely with Federal aid through PWA, the State's \$12,000,000 program of new buildings at 19 State institutions was 85% complete at the end of 1939. State financing was accomplished by means of tax anticipation warrants authorized by the legislature in 1937.

Charities and Correction.—State Hospital for the Insane, two homes and training schools for mental defectives, soldiers' and sailors' home, two industrial schools for boys and girls, workshop for the blind, Colorado General hospital, State Psychopathic hospital, State penitentiary, State reformatory and State Home for Dependent and Neglected Children.

Agriculture, Manufactures, Mineral Production.—Farm products, \$116,000,000; manufactures, \$237,838,000; tourist business, \$65,000,000; all minerals, \$67,339,000; 161 banks with total assets of \$358,079,875. (E. D. F.)

Columbia University, in New York city, had in 1939-40 a registration of 32,211 resident students, including 11,822 in the summer session of 1939. The total number of officers of instruction and administration was 3,266. There were 69 university buildings on Morningside Heights. In 1938 the university capital endowment was \$86,980,474.61 and the total resources were \$158,868,638.04. The budget appropriation for 1938-39 was \$14,719,134.11. Tuition fees range from \$390 to \$500. Its main library, containing 1,662,883 volumes, is housed in a new building, the gift of Edward S. Harkness, and known at present as South Hall, opened in 1934. A number of special collections remain in the former library, now known as Low Memorial Library. The department of home study courses, Seth Low junior college in Brooklyn and New College, have been dis-

continued. New accommodations have been erected at the College of Physicians and Surgeons for the Crocker Cancer Research Laboratories, formerly at Amsterdam avenue and 116th street, and the vacated Crocker building has been turned into studios for drawing, painting and sculpture. (M. H. T.)

"Columbus": see EUROPEAN WAR: *The War at Sea*.

Colville, Sir Stanley (Cecil James) (1861-1939), British admiral, was born on February 21. He served in the Zulu war of 1879, the Egyptian campaign of 1882, the Nile expedition of 1884-85, and was severely wounded in the Dongola expedition of 1896, when Kitchener's forces recaptured the Anglo-Egyptian Sudan province from the Mahdists. Sir Stanley became a rear admiral in 1906. As vice admiral in command at the Shetland and Orkney islands at the outbreak of the World War, 1914-18, he directed the vital task of organizing the defences of the British fleet at Scapa Flow. He was appointed admiral in 1914, and from 1916 to 1919 he was commander-in-chief at Portsmouth. From 1912 to 1914 he had commanded the First Battle Squadron of the fleet. Sir Stanley, who was placed on the retired list in 1922, died at London on April 9.

Comiskey, John Louis (1885-1939), U.S. baseball executive, was born at Dubuque, Ia., on August 12, the son of Charles A. Comiskey, a one-time star player and manager who became owner of the Chicago White Sox team, which his son inherited in 1931. John Louis Comiskey in eight years became known as one of the most enterprising executives in baseball, and by a series of shrewd purchases and trades of players he made his team a consistent contender in the American League. He died at Eagle River, Wis., on July 18.

Commonwealth Fund, The. This fund, established by Mrs. Stephen V. Harkness in 1918 "to do something for the welfare of mankind," appropriated approximately \$1,900,000 in 1939. Of this total some two-thirds was devoted to the promotion and maintenance of physical health, nearly 10 per cent more to mental health. Public health activities, designed to raise standards of rural service, centred in Tennessee, Mississippi, Massachusetts, Oklahoma and Alabama. The tenth in a group of rural community hospitals built with aid from the Fund was opened in 1939; two more are under way. These hospitals stress opportunities for professional education as well as standards of medical, nursing and technical service. Fellowships were offered in 1939 to junior instructors in medical schools, without restriction as to field of study, as a means of encouraging able young investigators and strengthening teaching resources; continued aid was given to departments of preventive medicine and psychiatry, to extension teaching and other forms of post-graduate medical education, and to teaching arrangements designed to promote interplay between pediatrics and psychiatry. Appointments were made as usual to the Commonwealth Fund Fellowships for British graduate students at American universities: the war held some appointees at home. The Fund continued to subsidize medical research; aided child guidance enterprises in England; maintained an advisory service for community mental hygiene clinics

in the United States; made small grants for studies in administrative law and legal history; and published in 1939 eight books and pamphlets of educational significance in its fields of operation.

Communism, or revolutionary Marxism, is the system of government evolved under the leadership of Lenin and Stalin in the Soviet Union. Communism believes in the dictatorship of the proletariat for a transitional period, after which a free society would come into existence in which everybody would contribute to the common weal according to his capacities, and receive a reward according to his needs. This ultimate goal seems yet very far away in the Soviet Union; meanwhile the Soviet Union represents a dictatorship of the Communist Party with State ownership of all the important means of production. Communism proclaims the equality of all peoples and races and believes in the final establishment of an international order. Within this general frame Communist policy has undergone since 1920 several fundamental and sometimes sudden changes. One of these changes occurred during 1939 and impressed its stamp upon the policy of the Soviet Union as well as upon the Communist Parties outside the Soviet Union. During the past years the Soviet Union, and under its direction the Communist Parties in the whole world, pursued a policy of co-operation with the democratic nations and with liberal and progressive groups, both as regards foreign as well as domestic policy. This attitude aimed at the creation of a common front against the "fascist danger" represented especially in the anti-Comintern pact which bound Germany, Italy, Japan, and some smaller vassal countries into an alliance directed against the Soviet Union and against the spread of Communist influence. This alignment continued until Aug. 1939. Then the conclusion of the pact of non-aggression between the Soviet Union and National Socialist Germany announced a sudden and complete reversal. It found its expression in the new policy of the Soviet Union as well as in the attitude of the Communist Parties outside the Soviet Union.

The Soviet Union was primarily motivated in this step by her old distrust of the "capitalistic democracies." She may have hoped to stay thus out of war and to strengthen her position by the acquisition of important strategic territories without being involved in a major war, for which her army, her supply, and her transportation systems appeared in no way adequate. These expectations seemed at the beginning realized with the easy acquisition of eastern Poland and of naval, military, and air bases in the Baltic States. But the resistance of Finland changed the picture. It aroused public opinion in the world against the Soviet Union, and it drove the Soviet Union into closer co-operation with Germany. The Soviet Union now took her definite stand at the side of Fascist Germany which until 1939 had been regarded as the arch-enemy of peace, of the working class, and of Communism itself, and followed Fascist Germany in her attack against the western democracies and against the League of Nations. The Communist Parties outside the Soviet Union took up immediately and obediently the new policy. Their rigid dependence upon Moscow has been long responsible for their lack of vitality and of success. The new and sudden turn-face, which first threw the parties and the leaders into a state of complete confusion, weakened further their position outside the Soviet Union. They had now, practically overnight, to pursue a policy diametrically opposed to that which they had defended for the last five years. They broke up the Popular Front, the movement of co-operation with moderate social democrats and progressive liberals, and returned to the policy of violent attacks upon progressive liberalism, evolutionary socialism, and democracy. In these attacks they found themselves frequently in accord with National Socialist and Fascist propaganda. The position taken by the Soviet Union

EARL BROWDER, general secretary of the U.S. Communist Party, was jailed Oct. 23, 1939, after being indicted on charges of using a false American passport

and the Communist Party in the European war led to the dissolution of the Communist Party in France, the only remaining country where as the result of the former policy of the Popular Front the Communist Party had reached a certain numerical strength. In the other countries the Communist Party remained negligible in numbers and in practical influence. But the new attitude of the Soviet Union carried some confusion into the ranks of progressive liberals with regard to the character of the war which had broken out in Sept. 1939.

The new attitude of the Soviet Union and her rapprochement with Fascism had been prepared by several trends in recent Communism. The position of Stalin had undergone a profound transformation as compared with that of Lenin. Lenin had been the exponent of an objective idea, of a social evolution; Stalin became now a personal leader, endowed with individual creative capacities similar to Fascist leaders. Lenin had been the disciple of Marx; Stalin was now extolled above Marx and Lenin who were regarded as his forerunners; they had been theoreticians who prepared the ground; Stalin now became the man who had realized the program and who, through his personal leadership, had built up the Soviet Union. The old Communists and co-workers of Lenin had all been liquidated in the great purges from 1936 to 1938; a new generation which had grown up entirely under Stalin's regime and which was animated entirely by the vision of a Stalinist Soviet Union had completely replaced the older generation in administration and in economic executive positions. Not only the history of the Russian Revolution and of the Communist Party was being rewritten according to Stalinist conceptions, but the whole history of Russia was reinterpreted in a spirit entirely different from that prevailing under Lenin. A new Russian patriotism was fostered, the Russian political and cultural past glorified. Not only historiography, but also literature and the arts, especially the theatre and the movies, were put into the service of this new conception. The effect of these changes began to make itself felt in the policy inaugurated in 1939 by Communism. (See also DEMOCRACY; FASCISM; PACIFISM; SOCIALISM.)

(H. Ko.)

Communist Party.

Communist parties in both hemispheres felt the impact of the Nazi-Soviet non-aggression treaty of 1939 and the subsequent Russian invasion of Finland. Although the exact number of defections by party members is not known, it was undoubtedly considerable. In the United States several prominent members, including the former business manager of *The Daily Worker*, announced their resignations. Earl Browder, general secretary of the party, denied any mass withdrawals and declared on September 11 that "the Communist party has never been so firm . . . as it is today." In his appearance before the Dies committee in 1939 he claimed a membership of 100,000, of whom one-third resided in New York State. This figure was roundly disputed by others, who estimated the number at 50-60,000. In the presidential election of 1936, Communists polled 80,159 votes, a decrease of approximately 20,000 from the vote in the election of 1932. The budget of the U.S. Communist party is approximately \$250,000 annually. The national office is at 35 East 12th street, New York city. William Z. Foster is chairman of the party. Earl Browder was indicted Oct. 23, 1939 on charges of using a fraudulent U.S. passport and was sentenced Jan. 22, 1940 to four years' imprisonment. He was also fined \$2,000.

The French Communist party, whose leader is Maurice Thorez, fared badly after the start of the European war. It was dissolved Sept. 26, 1939 and many of its prominent leaders were jailed. Three days later the party (which claimed a membership of 280,000 in 1937) reorganized and adopted a new name—the French Workers and Peasants Group. British Communists were not seriously molested. Their membership is estimated at 10,000.

Community Chest,

a term used to describe a local co-operative organization of citizens and social welfare agencies. It has two general functions: (1) to raise funds each year by a community-wide appeal for affiliated social welfare and health agencies and to distribute those funds by a budget procedure; and (2) to promote the social welfare and health of the community by co-ordinating services, improving standards, studying local problems, and developing better public understanding. Closely allied with the community chest is the Council of Social Agencies.

In 1939 there were 529 community chests, 513 of them in continental United States, one in the Virgin Islands, two in Hawaii, eleven in Canada and two in South Africa. All but six cities in the United States with more than 100,000 population have community chests. In 1939, 518 campaigns were reported, raising a total of approximately \$83,000,000. The 480 chests reporting campaign results for both 1938 and 1939 showed an average decrease of 3.1% for 1939 as compared with 1938.

The all-time peak for community chests was \$101,181,949, raised in 1932 when private agencies were trying to cope with unemployment relief and before Federal relief was under way. Subsequently chest funds declined somewhat until 1936. In that year the decline halted and chest funds increased until 1938, when they had reached 90.2% of the 1929 funds.

The history of the modern community chest movement is traced from 1913, when the Federation for Charity and Philanthropy was organized in Cleveland, Ohio.

Community Chests and Councils, Inc., 155 East 44th st., New York city, the national organization of community chests and councils of social agencies, was organized in 1918 as a clearing house for information for the 21 chests then organized. Today, 312 community chests and 16 councils of social agencies are affiliated with the organization on a voluntary membership basis. An advisory committee of local chest and council executives and a board of directors guide the organization policies. It is financed by dues from its corporate members.

An important activity of Community Chests and Councils, Inc., is administration of the annual Community Mobilization for Human Needs, which is sponsored by 36 co-operating national social agencies to give nation-wide backing to local campaigns. Charles P. Taft was chairman of the Mobilization from 1937 to 1940.

Officers for 1939 were George E. Vincent, honorary and acting president; John Stewart Bryan, Geoffrey E. Smith, vice-presidents; J. Herbert Case, treasurer; Pierce Atwater, secretary; Allen T. Burns is executive vice-president.

(A. T. B.)

Community Trusts.

During the quarter century since the establishment of the first community trust—at Cleveland, Ohio, on Jan. 2, 1914—the philanthropic resources of 78 subsequently created community foundations rose to approximately \$50,000,000. Apart from several such trusts in Canada and one in Hawaii, their development has occurred principally in continental United States. Characteristically, they are charitable administrative agencies comprised of multiple funds from diverse sources and for varied purposes, with several fiduciary institutions supplying fiscal management to the funds and a central distributing committee supervising appropriations of expendible sums. Usually a portion, and frequently a majority, of the distributing committee is named by the incumbents of positions of public trust, such as the head of the Association of the

HOW THE TWO CHIEF "ISMS" attempted to influence American public opinion in 1939, according to Hutton of *The Philadelphia Inquirer*

Bar or the Academy of Medicine, Federal judicial officials or those responsible for the authentication of wills. Each community foundation is, thus, a framework within which many charitable funds may be administered. Its distinctive procedure—subject to local variations—is ordinarily found in the circumstance that, though the distributing committee will undertake to give expression to the desires of a founder concerning the specific application of a fund established by him, discretionary power is vested in the committee to amend and adapt any such originally expressed desire if unforeseen changes in conditions make its literal execution impossible or impracticable.

The aggregate resources of community trusts reached \$25,000,000 in 1928, \$35,000,000 in 1930, and \$45,000,000 in 1935. Their combined appropriations in 1938 totalled \$1,700,000. The largest of these foundations, measured by capital held at the beginning of 1939, was the New York Community Trust with resources approximating \$8,600,000 followed by those in Chicago, Cleveland, Boston, Winnipeg, and Indianapolis.

With the probable diminution in the contemporary accumulation of large individual fortunes from which most of the great "personal" foundations of the present century sprung, it appears not unlikely that the numerous gifts of donors of more moderate means, reflected in the growth of these community trusts, may become an increasingly significant element of private philanthropy in the United States.

Conference of Commissioners on

Uniform State Laws. The National Conference of Commissioners on Uniform State Laws is composed of commissioners, usually three in number, from each of the States and insular and territorial possessions of the United States. Its purposes are to promote uniformity in State laws and to draw model acts on subjects suitable for interstate compacts, and in which uniformity will make more effective the exercise of State powers and promote interstate co-operation.

The Conference was organized in 1890, has held 49 annual meetings and adopted 79 uniform acts, among which the best known are the Uniform Negotiable Instrument Act, adopted in 53 jurisdictions, the Warehouse Receipts Act, adopted in 48 jurisdictions, the Bill of Lading Act, Declaratory Judgment Act, Machine Gun Act, Narcotic Drug Act, Sales Act, and Stock Transfer Act. Every State has adopted one or more of its uniform acts and many States have accepted 25 or more.

Each draft of a proposed act is subjected to thorough analysis by the entire Conference, is then revised, resubmitted, and frequently rewritten again before final adoption. All acts are approved by the American Bar Association before promulgation.

Members serve without compensation. The Conference is supported by an allowance from the American Bar Association and by contributions from certain States and State and city bar associations.

Congo, Belgian: *see* BELGIAN COLONIAL EMPIRE.

Congregational Church.

There are in the United States 6,096 churches with 1,043,276 members in the Congregational and Christian denomination. The records for 1938 show an increase of 12,362 in net membership of the churches and 6,431 in the church schools. This is the best record since 1925. These churches raised \$2,224,945 for benevolences and \$15,126,142 for the support of the local congregations,

showing increases in both of these items.

Because of the democratic nature of its organization, the denominational machinery is of the simplest sort. No State or national body has any authority over any local congregation, which is free to order its life to suit the needs of its people. At the same time, the churches maintain State and national agencies for mutual helpfulness. The State Conference office is a clearing house for the churches of the State and a central office for general church activity. In the nation the denomination has a central office, the General Council, at 287 Fourth avenue, New York, and also both home and foreign mission societies; the American Board of Commissioners for Foreign Missions, 14 Beacon street, Boston, and the Board of Home Missions, with which is affiliated the Council for Social Action, 287 Fourth avenue, New York.

During 1939, the New England churches damaged by the hurricane of Sept. 1938, were rebuilt and repaired, at a cost of more than \$2,000,000. Along with this necessary raising of funds for the work of local churches, benevolence giving for budgeted work and approved objects in 1938 show an increase of 16.9% over 1937.

The war in the Far East brought many serious problems to the American Board for Foreign Missions. Hospitals and schools in China have been damaged and orderly processes of life destroyed. But mission doctors have remained doing greatly increased service though seriously handicapped, and other missionaries and teachers have stayed by their work with the loyal support of the American churches. The European war did not affect mission work of the Congregational Church.

Abroad.—International Congregationalism maintains an international organization known as the International Council of Congregational Churches. This body meets once in ten years, and publishes a decennial volume on the life and work of the Congregational Churches around the world. Normally, the next meeting would have been held in Wellesley, Massachusetts, in 1940, but on account of war conditions it has been postponed until peace comes.

The principal regions in which Congregational Churches flourish, with the number of members, are as follows:

Congregational Churches (Abroad)

Africa	74,968	Madagascar	39,990
Australia and New Zealand	20,777	Near East	4,541
Brazil	6,349	Papua	6,666
China	33,070	Polynesia (excluding Hawaii and New Zealand).	24,831
Czecho-Slovakia	4,322	Philippines	6,110
England and Wales	419,561	Scotland	39,695
India and Ceylon	53,137	Sweden	110,569
Japan	32,860		

The International Moderator is the Rev. J. D. Jones of Bournemouth, England. The British office is at Memorial Hall, Farringdon st., London.

Congress of Industrial Organizations,

a federation of labour unions in the United States and Canada, of which John L. Lewis, president of the United Mine Workers, is president.

Formed on Nov. 9, 1935, as the Committee for Industrial Organization, the committee held its first constitutional convention in Pittsburgh on Nov. 14-18, 1938, changed its name, adopted a constitution, named Mr. Lewis president, Philip Murray and Sidney Hillman vice-presidents, and James E. Carey secretary. At the 1939 convention four additional vice-presidents were named.

The C.I.O. was formed by representatives of eight international unions affiliated with the American Federation of Labor to promote the development of industrial unions within the American Federation of Labor. They announced their purpose to encourage and promote organization of workers in the mass-production and unorganized industries of the nation.

The 1939 convention reported 45 national and international unions. The reported membership was (1938) 3,787,000.

The first objective of the C.I.O. was to organize the employees in the mass-production industries, such as steel, automobiles and textiles, into industrial unions. In 1938 the C.I.O. reported the membership of the Amalgamated Association of Iron, Steel, and Tin Workers had grown from approximately 10,000 to more than 525,000; the United Automobile Workers from 30,000 to 381,000, and the textile union from 25,000 to 450,000. In 1939 the C.I.O. ventured into new fields, notably the building construction field which had hitherto been the monopoly of the A.F. of L. (See also AMERICAN FEDERATION OF LABOR; CALIFORNIA: History; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (L. STA.)

Connecticut, one of the original States of the United States, popularly known as the "Nutmeg State" and

the "Land of Steady Habits"; land area, 4,820 sq.mi.; population (U.S. census, 1930), 1,606,903, estimated by the Bureau of Vital Statistics, July 1, 1939, 1,811,097. Capital, Hartford, 164,072. Other cities of over 50,000 population in 1930: New Haven, 162,655; Bridgeport, 146,716; Waterbury, 99,902; New Britain, 68,128. Of the State's population 1,131,770 were urban, or 70.4%; 1,576,673 whites; 29,354 Negroes; 1,222,267 native born; 384,636 foreign born.

History.—The principal State officers for 1939-40 are: governor, Raymond E. Baldwin (Republican, elected 1938, with 230,237 votes to 227,549 for Cross, Democrat, and 166,253 for McLevy, Socialist); lieutenant-governor, James L. McConaughy; secretary of State, Mrs. Sara B. Crawford; chief justice of the Supreme Court of Errors, William M. Maltbie (term 1930-46).

The general assembly of 1939 (Senate: 16 Republicans, 17 Democrats, 2 Socialists; House: 202 Republicans, 63 Democrats, 2 Socialists) was unusual for the leadership of young men with little previous experience and for freedom from the undesirable influences of lobbyists and bosses. In spite of severe cuts in departmental and institutional appropriations, unusual mandatory expenses produced the largest recorded biennial budget, \$106,206,491. The only additional taxation, an increase in the liquor tax, and the transfer of part of the cost of the State police to the highway account were, however, expected to provide a balanced budget for the first time in several years.

New legislation included reform of the minor court system, together with a proposed constitutional amendment to alter the appointment of the judges for those courts; revision of statutes concerning foods, drugs, and cosmetics to harmonize with Federal regulations; permission for alternate jurors in civil and criminal cases; requirement of uniform audit of town and municipal accounts; an anti-injunction law; and significant modifications of social security, labour, and liquor laws. Some desirable measures failed to pass because funds were not available for their administration. The current expenditures for the fiscal year ended June 30, 1939, were \$65,250,000. The State operated on a balanced budget and contemplates doing so in the current fiscal year.

No obvious change in political trends was revealed by the town and municipal elections of 1939, the only ones held during the year. With Judge Ernest A. Inglis presiding at one of the longest trials in the history of Connecticut's superior court, most of those under indictment for the Waterbury scandal were convicted. Various convictions were also obtained in connection with the Merritt parkway cases. The effects of these exposures and convictions have been salutary.

Education and Charities.—In the year 1938-39 there were 211,503 pupils enrolled in public elementary schools, and 84,926 in public high schools. A thorough reorganization of the State department of education was completed during the year; standards for the certification of teachers were improved; and a comprehensive study of the history of education in the State was inaugurated. The name University of Connecticut replaces that of The Connecticut State college, located at Storrs, where a \$3,000,000 building program is in progress. The State, in co-operation with the Federal Public Works Administration, is also erecting several new buildings at various State institutions, especially those for the care of mental cases, and is establishing a new school for the feeble-minded at South Britain and a new veterans' home at Rocky Hill.

Banking and Finance.—On Sept. 30, 1939, the 72 mutual savings banks in the State had total deposits of \$720,499,318 and total assets of \$812,565,097, being a slight increase over the previous year. The number of accounts increased to 977,993. In nearly all cases the dividend rate was 2½%. The 65 State banks and trust companies had total assets of \$358,767,197, a considerable

increase for the year. Hartford is the headquarters of most of the 25 large insurance companies operating under Connecticut charters. The admitted assets of the five life companies of Connecticut have grown to \$2,253,594,633, with 2,045,157 policies in force. In all companies there were 1,760,003 life policies in force in the State.

Highways.—The practical completion of the Merritt parkway and the beginning of work on the Wilbur Cross highway, which will continue the route through Hartford to the Massachusetts line, have been the notable achievements of the year in highway development. Special commissions have also been established to arrange for the construction of new bridges across the Connecticut at Hartford and across the Thames at New London. The system of State roads has nearly reached the point where it will no longer be necessary to develop new routes but rather to carry forward reconstruction of the existing ones on a more modern basis. The number of car registrations on Oct. 1, 1939 (468,312) and of licensed operators (549,259) exceed the record for any preceding full year. The ratio of accidents to highway use reached the lowest point recorded in 1938. Apparently this low record will be approximately equalled in 1939, thanks to the extensive campaign to promote highway safety.

Agriculture, Manufacturing.—Agricultural production of the State in 1939 showed increases for some crops but for others the yield was somewhat reduced by the prolonged dry weather in the summer. Both in acreage and in value the principal crops are tobacco, hay, potatoes, and corn. Fruit growing, gardening, and poultry raising are also conducted extensively. In number of chickens, turkeys, and cattle, especially milch cows, there has been some increase over previous records. Connecticut is, however, pre-eminently a manufacturing State. In 1937 the 2,892 factories employed 262,620 hands and produced goods valued at \$1,261,788,693, an increase of 40% over 1935. There was a similar increase in wages paid. Metal industries, notably brass, were the most important. In recent years the manufacture of aeroplanes and their parts has grown rapidly and the State now ranks third in the field. Industrial activity during 1938 was below the 1937 level but in 1939 there was considerable improvement. Time lost because of strikes was small.

Contract Bridge. The year 1939 brought no changes in Contract Bridge. Paradoxically, however, it enjoyed one of its most successful years. Its continued popularity was attributed to three major causes: (1) the laws, prepared in 1935 by the Whist Club of New York, the Portland Club of London and the Commission Française du Bridge of Paris, acting as a body, remained in force unchanged; (2) increased standardization in bidding methods, and (3) the bickering between rival factions in America and Great Britain was reduced to almost nothing.

When the present code of laws was adopted in 1935, the three collaborating committees promised there would be no material changes until 1940. This promise was kept and it wasn't until late 1939 that negotiations were entered into for the purpose of revising the laws. Meetings of the American Co-operating Committee started summer of 1939 and the new code will appear late in 1940. A new code governing Tournament Bridge is also being prepared by the American National Laws Commis-

sion and this code will also be published in 1940.

One of the major changes suggested to the Committee was the "Equalizing of the suits," that is, placing the minor suits (diamonds and clubs) on a par with the major suits (spades and hearts). Thus, four-odd in the minors would make game, as in the majors. This would leave the five-odd zone open. To fill this void, a "sub-slam" has been suggested with a small bonus—two or three hundred points—for the successful fulfilment of a five-odd contract. The Association of Playing Card Manufacturers and the *Bridge World* magazine sent out a questionnaire to thousands of players on these two proposals, and the vote was overwhelmingly in favour of them.

The Culbertson system, used by over 90% of the estimated 15,000,000 followers of the game, remained virtually the same except for two minor changes. The first was grafting to the system the Blackwood convention of slam-bidding. This convention caught the public's fancy and was made an auxiliary to the Culbertson 4-5 Notrump convention. The second change was the dropping of the Two-Way Three Bid and substituting for it a "strong" three bid. With a few variations, the three-bid now calls for a solid suit (at least six cards long) in the minors, a within-one-trick of solid suit in the majors, and no more than one honour-trick outside the suit. The hand, in general, should contain between 6 and 7½ playing-tricks. Both these changes added power and flexibility to the system and did much to bind the Culbertson adherents into a more compact group.

The wars going on throughout the world did not affect contract bridge to any extent. The Eighth Annual World Bridge Olympic was held as usual in 1939 and among the warring nations competing were England, France, China, Japan, Finland, Russia, and Germany. In the latter country, the date was changed to the night following the regularly scheduled one because of a conflict with Hitler's birthday. The World Bridge Olympic Committee granted this change. In all, 52 countries took part in the Olympic and over 180,000 players competed.

An interesting sidelight on the effect of war on contract bridge was the report from England that the black-outs have caused a decided swing from club to home play. Fear of air raids has taken a secondary position to fear of traffic accidents, and as a result home play has been given a great stimulus—as proved by increased sales of playing cards and all bridge accessories. From the Maginot Line have come hurry calls for more cards and bridge scores, thus attesting to the popularity of bridge over the World War's favourite games—poker, blackjack, and red dog.

The American Contract Bridge League (an amalgamation of the American Bridge League and the United States Bridge Association) reported more interest and greater attendance than ever before at tournaments. Records of long standing were broken at the annual national championships at Asbury Park, N.J., and Pittsburgh, Pennsylvania.

The League instituted an annual nation-wide card party on St. Valentine's Day, the proceeds of which are for the relief of crippled and undernourished children. Over 50 cities held games, and in each case, the money taken in was used for some worthy charity for children. A local newspaper usually collaborated and the slogan of the card party, "Have a Heart—Take a Hand" was popularized in bridge circles all over the United States. Plans are under way to tie this movement up with the charitable activities of the American Legion.

Ely Culbertson went into temporary retirement for eight months during which time he wrote his autobiography, *The Strange Lives of One Man*. This book, he announces, will tell the full inside story of bridge—from its original idea to the paste-board empire it is today. In addition, Mr. Culbertson tells of his early life in Russia, Mexico, Canada, and France. (E. CUL.)

Co-operatives: see FARMERS' CO-OPERATIVES; MARKETING.

Copper. Nine copper-producing countries with outputs, present or past, in excess of 50,000 tons, accounted for 90% of the world total in 1929, and 86% in 1938, which is only a comparatively small change, but in the meantime there has been a radical change in the status of many of the individual producers. The United States proportion of the total has decreased from 49% to 25%, Belgian Congo from 7% to 6%, Mexico from 4% to 2% and Peru from 3% to 2%; on the other hand, Canada has risen from 6% to 13%, Chile from 16% to 18%, the Soviet Union from 1.3% to 5%, and Rhodesia from a fraction to 11%; Japan has remained approximately unchanged. All major countries except the United States, Mexico, Peru, and the Congo, and many of the minor ones, were still well above the 1929 level in 1938. Canada alone showed a material increase over 1937-10%, while the United States declined 34%, Belgian Congo 18% and Chile 15%.

World Production of Copper
(In thousands of metric tons)

	1929	1932	1936	1937	1938

Ex. U. S.	990.5	673.7	1,120.0	1,514.2	1,479.5

Statistics for 1939 are very incomplete since data are lacking for nearly all countries since the beginning of war in Europe. Such information as is available indicates a material improvement in United States output, probably about 30% for mine output, 33% for smelter output, and 26% for refinery output; sales to domestic consumers were up much more, pointing toward heavy withdrawals from stocks, which by mid-year had doubled since 1936. Canadian production rose 6% to 275,000 metric tons. During the first three quarters of 1939 output in Chile was at the rate of 298,000 metric tons; Mexico 43,500 tons; Peru 33,500 tons; and all of Africa 325,000 tons. Total world output should be somewhat greater than in 1938. During 1938, the international

COPPER PRODUCED in the United States; smelter output from domestic (including Alaskan) ores

copper cartel made three changes in production quotas; on Jan. 1, 1938, the operating rate was set at 100%; on March 1, at 95%; and on August 16, at 105%. The members of the cartel supply about 75% of the world total, and the percentage figures on which quotas are based refer to the operating rate at the time the cartel was formed, and not to the actual capacity of the plants, which is about 50% greater.

All of the countries listed in the table, with the exception of the United States, Japan, and the Soviet Union, are comparatively small consumers of copper, and hence produce mainly for export. The chief copper consuming countries, in order of importance, are the United States, Germany, the United Kingdom, Japan, the Soviet Union, and France, which cover 80-90% of the total consumption. The United States is the only major consumer with an export surplus; all others are dependent on imports for a large proportion of their supply. In spite of the fact that on the average 22% of the output is exported, consumption of copper in the United States far exceeds the new copper supply, the remainder coming from secondary metal recovered from previous use, a source which yielded a larger amount of copper during the depression years than was obtained from the primary production.

The United Kingdom, now third largest consumer, has only a nominal output, and secures practically its entire supply from imports, a growing amount of which is re-exported. About 55% of the imports is from Empire sources, 35% from the United States, and 10% from Chile. Ore and matte make up only about 2% of the imports, the remainder being divided in about equal proportions between rough copper and electrolytic. In 1938 Germany took second place as a consumer of copper, replacing the United Kingdom, while in 1937 Japan had replaced the Soviet Union in fourth place. Germany in 1938 consumed about 447,000 tons, 37% of which came from crude imports, 30% from refined imports, 9% from imported ore, 7% from domestic ore, and 18% from secondary recovery; exports are negligibly small. Russian production supplies about two-thirds of the demand, and imports one-third, while in Japan production is slightly less and imports proportionately higher. France has practically no domestic output, and imports almost the entire supply. (See also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION; STRATEGIC MINERAL SUPPLIES.) (G. A. Ro.)

Copra: see COCO-NUTS.

Copyright. During the year 1939, with the exception of the Print and Label Law, which transfers jurisdiction over these types of copyrightable material from the Patent Office to the Copyright Office effective July 1, 1940, no change has occurred in the provisions of the American Copyright Act.

On January 30 a decision was handed down by the Supreme Court of the United States in the case of *The Washingtonian Publishing Co. Inc., Publishers, v. Drew Pearson, Robert S. Allen, and Van Rees Press, Inc., et al.* Under Section 12 of the Copyright Act the mandatory duty is imposed upon him who publishes with copyright notice and thereby secures copyright, of promptly thereafter filing with the Copyright Office two copies of the work accompanied by application for registration of claim of copyright therein. The section provides that "no action or proceeding shall be maintained for infringement of copyright in any work until the provisions of this Act with respect to the deposit of copies and registration of such work shall have been complied with." The facts before the Supreme Court were that A had published a book with copyright notice but had failed promptly to deposit and register as required by Section 12; that before such deposit and registration B infringed the copyright, whereupon A deposited and registered and brought suit for infringement against B. The

question before the Supreme Court was "Can A, after having deposited and registered, sue the infringer for infringement which occurred before such deposit and registration?" The answer of the Supreme Court was that the action would lie; and the point was emphasized that Section 12 did not provide that the delinquent depositor could not bring suit *unless* he registered promptly, but did provide that he could not bring suit *until* he registered. Under the Copyright Act the existence of the copyright is not made to depend upon deposit or registration. Once secured by publication with notice, copyright can only be lost in the ways designated in the statute, and failure promptly to deposit or register does not constitute one of these ways. (C. L. B.)

Corn (MAIZE). New, all-time high records of corn yields were established in 1939 in Illinois, Iowa, Ohio, Indiana, and Minnesota while for the entire United States the yield was the highest in 19 years, 28.6bu. to the acre, compared to 27.7bu. in 1938 and a ten-year (1928-37) average of 23 bushels. Although the United States Government has been encouraging reduced acreage of corn since 1934 the higher yields are attributed to the planting of more productive hybrid varieties of corn and the restric-

Table I. Corn Production by States in 1938 and 1939
(Reported by U. S. Department of Agriculture, Nov. 1, 1939)

	1939 bu.	1938 bu.	Average 1928-37 bu.

*United States foreign service reports.

November 1 as 2,591,063,000bu., compared to 2,542,238,000bu. in 1938 and a ten-year (1928-37) average of 2,309,674,000 bushels. In Canada, October estimates by the Dominion Bureau of Statistics placed the 1939 crop for husking at 7,566,000bu., as against 7,690,000bu. in 1938.

The Institute reported the corn acreage of Germany in 1939 as 255,000ac. compared to 347,000ac. in 1938 when 14,944,000bu. of corn was harvested, including Austria and the Sudeten; in France a 1939 acreage of 814,000 compared to 841,000ac. in 1938 when the crop was 22,779,000 bushels. In Bulgaria the 1939 acreage was 1,527,000 as against 1,731,000ac. in 1938 when the crop was 20,955,000 bushels. No 1939 estimates for Russia were available, but the 1938 crop was reported as 108,592,000bu. while that of Manchoukuo was 98,814,000bu., Egypt 61,834,000bu., and Turkey 23,759,000 bushels. (See also CEREALS.) (S. O. R.)

Cornell University. A non-sectarian, co-educational institution in Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill Act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law, and medicine (located in New York and operated in conjunction with the New York Hospital), and the State-supported colleges of agriculture, home economics, and veterinary medicine. Two experiment stations, at Geneva and Farmingdale, are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school. During the academic year 1938-39, there were 7,055 students, of whom 1,597 were women. The faculty, which had 1,691 members, included 50 emeritus professors, 318 professors, 273 assistant professors, 23 lecturers and associates, 464 instructors, and 563 assistants. An important development on the campus during the spring of 1939 was the establishment of a Federal nutrition research laboratory, the program of which will be co-ordinated with the programs of the related departments of the university. Productive funds on June 30, 1939, amounted to \$30,872,433. Land and buildings were valued at \$19,692,679, and equipment at \$7,841,343. The library contained 1,036,404 volumes. President, Edmund Ezra Day, Ph.D., LL.D. (E. E. D.)

Corundum. The United States has no production of corundum, the natural oxide of aluminium, and depends entirely on imports, which vary from 2,000 to 4,000 long tons annually, mainly from South Africa. Extensive deposits are known in the Zoutpansberg, Pietersburg, and Leydsdorp district of Northern Transvaal, and these now furnish the bulk of the world supply; the 1938 sales were 1,549 short tons, against 4,851 tons in 1936. From 1905 to 1921 Canada was the leading producer. (G. A. Ro.)

Costa Rica, a Central American republic; language, Spanish; León Cortés, capital, San José (pop. 63,436); president, León Cortés; area, 23,000 sq.mi.; population (1936 estimate), 606,581.

Costa Rican activity during 1939 was largely in connection with foreign relations. Throughout the year efforts to adjust the country's foreign debt were made, but without success. In March, Congress levied a 100% duty on goods from countries whose sales to Costa Rica exceeded their purchases by 50%. Japan was the chief nation affected. Early in the year proposals in the United States Congress that Cocos island, uninhabited Costa Rican territory in the Pacific, 300mi. from the mainland, be leased or pur-

chased as part of the Panama canal defences, attracted considerable attention, and, in September, a military detachment was sent to occupy Cocos to prevent its use by belligerents during the European war. Efforts by Nicaragua to induce Costa Rica to sign a treaty for the canalization of the San Juan river were made in October, but without result. In December, Costa Rica vigorously protested Russian aggression against Finland.

Costa Rica has external communication by sea and by Pan American Airways, supplemented by the partially complete Inter-American highway. Internal communication is by several domestic airlines, 450mi. of railway, and an 1,800mi. highway system.

In 1938, imports (principally foodstuffs and manufactured goods) increased slightly, to \$12,620,721 (United States, 49.1%; Germany, 19.8%); exports declined 12½%, \$10,145,614, going largely to the United States, Great Britain, and Germany. Coffee and bananas, supplying 48.7% and 27.6% of exports, are the mainstay of Costa Rican economy, although cacao is also important. Banana production rose during 1938 and 1939 due to development of plantations on the disease-free Pacific coast. Gold production in 1938 was in excess of \$500,000 value.

The monetary unit is the colon (value: 17.79¢ U.S.). In 1939 the national expenditures were estimated at 31,299,000 colones, but unexpected decline in revenues compelled downward revision. Education was allotted 17%. Costa Rica, cultural centre of Central America, has 606 public elementary schools, with an enrolment of 54,750 in 1937. (L. W. BE.)

Costigan, Edward Prentiss (1874-1939), U.S. senator and lifetime liberal, was born in King William county, Virginia, on July 1. After graduating from Harvard in 1899 he established law practice in Denver. He was a founder of the Progressive or "Bull Moose" party which nominated Theodore Roosevelt for President in Aug. 1912. Costigan ran for governor of Colorado on the same political ticket but was defeated. Later he made his peace with President Wilson, who appointed him to the U.S. Tariff Commission in 1917. His espousal of the flexible tariff met with constant criticism from the Republican administrations of 1920 and 1924, and he resigned in 1928. He was in the Senate from 1931 until his retirement in 1937, and sponsored such legislation as a sugar-quota bill and the famous Costigan-Wagner anti-lynching bill which was a political football in the Senate for several years. Costigan died in Denver January 17.

Cost of Living. The upward trend of the cost of living characteristic of almost the entire world after 1933 continued into 1937-38, but only in France and Norway (excluding war areas) did 1937-38 indexes of food prices go higher than in 1929. In most nations 1937-38 food prices were higher than 1936 and higher again in 1939. The outbreak of the European war was stimulating the upward movement of prices during the last half of the year. Great Britain, Finland, Belgium, Norway, and Switzerland experienced almost a 10% increase in food prices in 1937-38 but during the first half of 1938 cost of living stabilized at approximately the 1937 levels in most of the nations. In 1939 there was a slight increase during the early part of the year and a more substantial upward movement during the late summer and fall.

The inclusion of rent, clothing, fuel and sundries in a cost of living index tends to increase its stability as compared with an index based upon food prices only. The latter fluctuate faster and more sharply. This is apparent when the British, Canadian, and American indexes are examined. The accompanying table includes a varied assortment of items and not merely food costs.

The detailed figures of the United States, Canada and the

Indexes of Cost of Living for Specified Periods for the United States and Certain Foreign Countries

Cotton. The "cotton year" begins August 1 and ends July 31. Thus, in the year 1939-40 the cotton crop in the northern hemisphere is harvested in 1939 and the southern hemisphere crop in 1940. World supply of all growths of cotton for the year 1939-40, ending July 31, 1940, was estimated by the U.S. Department of Agriculture on Nov. 27, 1939, as about 49,300,000 bales. This is only slightly less than the record supplies of 50,046,000 bales in 1937-38, and 50,550,000 in 1938-39. It includes world production in 1939-40 of 27,800,000 bales and a world carry-over Aug. 1, 1939, of 21,500,000 bales. World production in 1938-39 was 27,407,000 bales and the world carry-over 22,639,000 bales. In 1937-38 world production was 36,784,000 bales and world carry-over 13,766,000 bales.

World mill consumption in the period 1939-40 is expected to be about the same as the year's production, increased consumption in the United States offsetting decreased mill activity in parts of Europe.

World mill consumption in the period 1938-39 was 28,500,000 bales. The record year in world mill consumption was 30,600,000 bales in 1936-37.

The world supply of United States cotton in 1939-40 was estimated at 25,700,000 bales. This is only slightly below the peak of 26,224,000 bales in 1932-33. It includes a world carry-over of United States cotton of 14,030,000 bales of 478lb. net, which is a new high. World supply of United States cotton in 1938-39 was 25,377,000 bales, with 13,712,000 bales in the carry-over; in 1937-38 world supply of United States cotton, 24,647,000 bales, with a carry-over of 6,235,000 bales. The United States crop harvested in 1939 was estimated Dec. 1, 1939, by the Department of Agriculture as 11,792,000 bales of 500lb. gross each, with an indicated yield of 235-qlb. of lint cotton per acre from 23,928,-

000ac. harvested after abandonment of 3.6% of the 24,832,000ac. in cultivation July 1, 1939. The United States crop harvested in 1938 was 11,943,000 bales and the ten-year (1928-37) average 13,800,000 bales.

Close governmental control over cotton and cotton goods was established by practically all European nations with the outbreak of war in Sept. 1939. Belligerents declared cotton a conditional contraband, subject to seizure. Non-combatants adopted control to conserve supplies and to avoid violation of neutrality. Germany had had increasingly comprehensive cotton

control since 1933, including compulsory use of substitutes, chiefly rayon, as a part of cotton fabrics. On Dec. 1, 1939, Great Britain, revived the "Navi Cert" plan which was adopted March 11, 1916, during the World War, and which provides for certification of neutral export cotton at ports of shipment, thus avoiding or expediting inspection for contraband at sea.

France and Great Britain both instituted complete Government control of imports and trade in cotton and cotton goods, British control being under the Board of Trade, with a cotton board set up to administer control, including the primary duty of providing for governmental needs; also, to promote exports of cotton goods and, if necessary, to allocate supplies.

In the United States during the first three months of the European war the average farm price for cotton was 8.85¢ per pound, about 7% higher than a year earlier, but 2.2¢ below the ten-year (1928-37) average. In support of an export market the Federal Government on July 27, 1939, adopted a plan to pay an export subsidy of 1.5¢ per pound. This, with the subsequent war demand, greatly increased exports. On Dec. 6, 1939, the Government reduced payments on export cotton to 0.75¢ per pound. Two days later payments were reduced to 0.40¢ per pound, and on December 11 to 0.20¢ per pound. On June 23, 1939, the United States arranged to exchange more than 600,000 bales of Government

COTTON CROP in the United States. The figure for 1939 is the Department of Agriculture's December estimate

COTTON was "the white elephant from the south" in 1939, according to Elderman of *The Washington Post*

owned cotton with Great Britain for rubber. As a further effort to broaden foreign markets for United States cotton the Department of Agriculture subsidized a one-variety program of exports to counteract complaints of foreign spinners that United States cotton lacked uniformity and was badly packaged. In 1938-39, under this program, 3,800 bales of especially-prepared cotton were exported. This, the department announced, is to be increased to 30,000 bales in 1939-40. From August 1 to November 24 United States cotton exports of 2,200,000 bales were almost 50% larger than the unusually low exports for the same period in 1938, exports to Great Britain being nearly four times larger and to other European countries, other than German controlled, 15% to 70% larger, while exports to Japan were 16% smaller. Cotton mill operations in Japan in 1939 were curtailed by Government restrictions on electric current and fuel. Chinese cotton imports, however, for the year ending Sept. 30, 1939, were 1,020,546 hales, the highest since 1931-32 and 25 times more than in 1938. The Japanese effort to produce cotton in Taiwan had its third successive unsatisfactory year, the 1939 crop being estimated at 5,000 bales from 28,764 acres. The 1939 Chinese crop was estimated at 2,000,000 hales, the smallest in more than 20 years.

The United States Government held in late November more than 10,100,000 hales of cotton (excluding cotton in the rubber barter with Great Britain). Of this, 6,100,000 hales were owned by the Government and 4,000,000 hales were held as collateral for Government loans to farmers. On Dec. 9, 1939, United States farmers voted for the third consecutive year in favour of the Department of Agriculture marketing program. Preliminary returns showed that 812,420 farmers voted for, and 78,047 voted against, marketing quotas for the 1940 crop. (S. O. R.)

Cotton Manufacture.—The cotton-textile industry of the United States and the world, which in recent years has suffered from the disturbing and, to some extent, contracting effects of

complex competitive impulses such as (1) synthetic fibres, (2) new industries in hitherto agricultural countries and sections of countries, (3) new technique, and (4) new forms of governmental participation, experienced a new impact in 1939: that of the war in Europe. The importance of this as a factor contributing toward further dislocation in both combatant and neutral countries is obvious. Its influence may not be as permanent or far-reaching, as that of a long-term trend such as the expansion of synthetic fibres for example, but for 1940 at least the war is Industry Problem No. 1.

War's first effect on the cotton-textile industry of the United States can best be described as that of a shot in the arm. Prior to the outbreak of hostilities, mill activity had been proceeding at a higher rate than that of the depressed year 1938, in the face of a rather listless demand with resultant inventory accumulation and profitless prices. The war changed all that. Sudden demand, largely speculative in character, forced prices up, restored profit margins, and impelled capacity operations of all cotton mills. The net result was a 25% higher rate of mill activity in 1939 than in 1938 and one which exceeded the previous record rate of 1937. The year 1939 closed with the industry optimistic, and with apparent prospects for a lasting return of profits in cotton manufacture. Coupled with improved conditions within the United States was expectation of expanded export markets. However there were so many imponderables in the situation that it was difficult to see much beyond three months at a time.

Wage-Hour Legislation.—Second only to the war abroad as a factor in the development of the United States cotton-textile industry in 1939 was what threatened to be another War Between the States, at least so far as this industry was concerned. The cause was the recommendation of a minimum wage of 32½¢ under the wage-hour law, for the cotton, rayon, and silk divisions of the textile industry. The law, which became effective Oct. 24, 1938, set a mandatory minimum of 25¢ for all industries covered, commencing with that date, and a minimum of 30¢ to take effect Oct. 24, 1939. The first industry committee appointed by the wage-hour administration was the textile committee. Its recommendation, in March, of a flat 32½¢ wage aroused a storm of protest from the cotton-textile industry of the South, on the basis that it was entitled to a differential below the rate for the North. Prolonged hearings were held before the administrator, and much heat was engendered on both sides. Finally, on September 13, the wage-hour administrator announced the acceptance of the 32½¢ recommendation, to take effect Oct. 24, 1939, instead of the 30¢ wage mandatory under the law. What had threatened to be a major explosion, however, turned out to be only a little firecracker, since by that time the industry was in the first stages of activity induced by the war in Europe, and the minimum wage advance became a minor issue. However, the controversy promises to rise again when slack times return in cotton manufacture. In addition, the importance of the minimum wage is its potential stabilizing effect as a factor to prevent wage-chiselling and subsequent market collapse during times of depression.

Another activity of Government affecting the American cotton manufacturing industry during 1939 was the imposition of an export subsidy of 1½¢ per pound, effective July 27. This represented an attempt to win back the export market for cotton. So sharp was the increase in export sales during the succeeding months, however, due largely to the outbreak of the war and to the removal of the uncertainty which had preceded the decision on the subsidy, that subsidy funds were quickly exhausted and in the late fall a series of cuts reduced and practically eliminated subsidy payments.

Of major importance in the outlook for 1940 was the question of revival of a processing tax to finance farm payments. Although

known, as the Certificate Plan, the proposed scheme is essentially the same as the processing tax. Prospects for and against its adoption were about even as Congress convened early in 1940.

The Battle for the Markets.—Despite the stimulating effect of the war on cotton consumption in 1939, cotton continued to be on the defensive during that year. It still had to fight desperately to hold its markets not only against the competition of the old-line fibres but against the encroachment from new synthetics as well as from products of other industries such as paper, etc. Of the new fibres the best publicized was Nylon, but its initial threat was directed largely against silk, in full-fashioned hosiery. Vinyon, which also came into fruition in 1939, was more directly a cotton competitor in that much of the early experimentation was in the industrial-fabric field, where cotton has held sway. More important than either of these, however, was the growing use of staple fibre, which differs from the ordinary or continuous-filament rayon, in that it is supplied in cut lengths to be spun on standard textile equipment. Consumption of staple fibre in the United States alone grew from less than 1,000,000lb. in 1930 to approximately 100,000,000lb. in 1939. The latter year showed nearly 100% increase over 1938. The competition from outside products such as paper continues to be most serious from the standpoint of the cotton manufacturer. Excellent merchandising on the part of manufacturers of paper products, particularly those intended for the home, has been a threat to manufacturers of towels, table linen, etc.

However, the cotton industry has accepted the challenge from these various sources and is putting up a good fight for its markets. Active programs launched by the cotton manufacturers themselves, by groups of interests allied with the raw cotton trade, by large retailers who have been pushing the use of cotton bags, and by Government departments, have been co-ordinated gradually into an aggressive movement. New uses such as employment of cotton fabric for covering cotton bales, for erosion control, for lining of irrigation ditches, etc., hold promise for the cotton industry. The projection of four regional research laboratories under the U.S. Department of Agriculture, to be located at Peoria, Ill., New Orleans, La., Philadelphia, Pa., and San Francisco, Calif., is an important potential in the fight. National Cotton Week in 1939 set a new record.

Technological Developments.—The trend toward increased efficiency, higher speeds, and more completely automatic operation in textile equipment has continued unabated. In fact, that trend has been accelerated by the increases in mill costs arising from Federal wage-hour legislation. By reducing the possibilities for price-cutting through wage-cutting, the minimum wage has forced manufacturers to adopt modern equipment if they are to continue to exist. Most of these improvements had their start earlier than 1939, but one interesting development belonging to that year was the introduction of paper bobbins for use on cotton spinning frames. This practice, which had already been adopted quite widely in Europe, had for its purpose the elimination of vibration resulting from operation of the frames at increasingly high speeds. In addition to the expanded use of more efficient equipment, new and versatile finishes such as pre-shrunk finishes, crease-resisting finishes, etc., are playing an important part in the technological progress of the cotton industry.

Employer-Employee Relations.—One of the interesting developments in 1939 in industrial relations in the cotton-textile industry was the start of the movement to put the mill village in southern cotton mills on a more rational basis. These villages have been carried at a loss, representing a financial burden on the operation of the mill, and also inviting unfair wage comparisons with other sections of the country. A number of mills took steps in 1939 to arrange for the sale of their villages to

the employees, not only to eliminate these disadvantages but also to encourage home-ownership. At the same time, consideration was being given to the possibility, in those mills where the villages were not to be sold, of separating the finances of the village from the mill, and placing the differential in the pay envelope. This promises to progress and to eliminate one of the difficult phases of industrial relations in the South. In addition, steps have been taken to inform both the general public and the employees concerning the actual status of working and living conditions in southern cotton mills, with excellent results. Campaigns such as those conducted by the Cotton Manufacturers Association of Georgia, and the Cotton Manufacturers Association of South Carolina, as well as the publication of the book *Faces We See* by Mildred G. Barnwell of the Southern Combed Yarn Spinners Association—a photographic record of mill life in the plants of that group—and the release of an industry-financed moving picture have been constructive influences.

Conclusion.—From the above it will be recognized that, although the cotton industry has faced and is facing a strenuous fight, it has been organizing on several fronts for the successful waging of that fight. Through promotion, co-ordination, technical advance, and industrial relations effort, it has launched a constructive and positive program. Cowles, Henry Chandler (1869–1939), U.S. botanist and educator, was born at Kensington, Conn. on February 27 and was educated at Oberlin college (A.B., 1893) and at the University of Chicago (Ph.D., 1898). After teaching in Nebraska and acting as a special field assistant for the U.S. Geological Survey, he joined the faculty of the University of Chicago in 1902, later advancing to a professorship. From 1925 until his retirement in 1934 he was chairman of the university's department of botany. He specialized in plants of the Chicago area and was one of the first botanists to do research in plant ecology. In 1918 he was president of the Ecological Society of America, in 1922 president of the Botanical Society of America, and in 1930 president of the ecology section of the International Botany Congress. He died at Chicago September 12.

Crane, Charles Richard (1858–1939), American industrialist and diplomat, was born in Chicago on August 7. From 1894 to 1912 he was first vice president of the Crane company, manufacturers of plumbing equipment; he was president from 1912 to 1914. President William Howard Taft appointed him minister to China in 1909, but the Japanese Gov't strongly protested his nomination on the grounds that he was anti-Japanese. At the instance of Sec'y of State Philander Knox, Crane was recalled before he had left the country to take his post. He then broke with the Republicans and became vice chairman of the finance committee for Woodrow Wilson's campaign in 1912. President Wilson appointed him a member of a special diplomatic commission to Russia in 1917. He was American commissioner on mandates in Turkey in 1919 and U.S. minister to China from 1920 to 1921. He died February 15 at Palm Springs, Calif.

Cricket. The 1939 cricket season in Great Britain was interrupted by plentiful rain and finally cut short by the outbreak of war. But it was made most enjoyable by the visit of a West Indian side, captained by R. S. Grant and including such heroes of the past as Headley and Constantine.

There were three test matches. The first, played at Lord's, was won by England, by eight wickets, with half an hour to spare. Hutton and Compton batted finely, but the feature of the match was a century in each innings by George Headley.

The second test match at Manchester was drawn, largely owing to Manchester's proverbial rain. The third, at the Oval, also ended in a draw, after high scoring on both sides. Hutton and Hammond for England, Weekes and Constantine for the West Indies, all giving splendid exhibitions of batting. All through their tour the West Indians endeared themselves to the crowds by their brilliant fielding, free batting and that air of jollity with which they always seem able to invest their cricket. Grant led them just as such a side of happy cricketers should be led, and every lover of the game was glad to see them give an excellent account of themselves.

The county championship was again won by Yorkshire, with Middlesex second and Gloucestershire third. Yorkshire, as so often in past years, brought into the field an all-round excellence and a will to win which were too much for most of their opponents, though they were twice beaten by Gloucestershire. Even when test matches made heavy calls on their front line players, a second line of "unknowns" appeared and made one wonder at the limitless resources of this great cricketing county. Sutcliffe showed much of his old form and finished with an average of over 54. Hutton batted in great style while Verity and Bowes finished first and second in the bowling averages. The Oxford and Cambridge match was won by Oxford, by 45 runs, but only after Cambridge had made a most gallant second innings effort, totalling 384 runs, Dickinson making roo and Webster (the side's fast bowler) a very brave 60. The Eton and Harrow match was perhaps the match of the year. It was won by Harrow for the first time since 1908.

Towards the end of the year came news of the Sheffield Shield matches in Australia. Don Bradman was in his usual terrific form and began scoring century after century for South Australia. O'Reilly seemed to be bowling as craftily as ever, and Grimmett showed what a grave mistake was made when he was omitted from the last Australian side to visit England.

War started just before the cricket season was due to end, and leading cricketers made haste to offer their services to their country. It will be good to hear the sound of bat and ball again on village greens and county grounds.

*Includes one win in one-day match (8 points).

†Includes two points for tie on first innings in match lost.

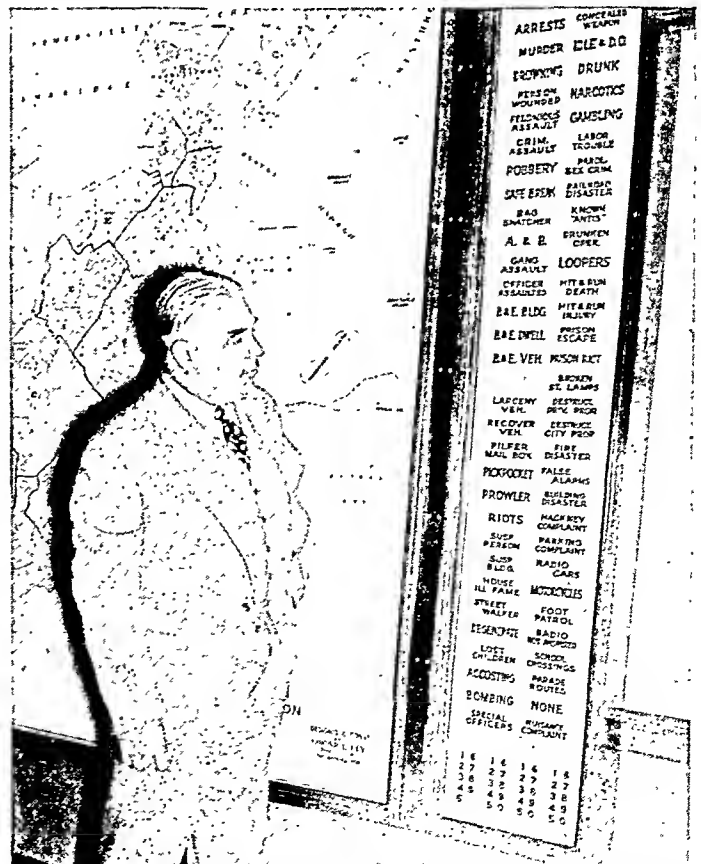

Crime. The *Uniform Crime Reports*, which have been continuously published since 1930, continue to grow both in scope and in completeness. As of Dec. 1, 1939, these reports cover 93.6% of all cities and towns in the U.S. with over 10,000 population, and 98.0% of the total population of this group of communities. In addition, crime reports are compiled for a large number of small municipalities, and some rural areas. Using these sources as an index for the country as a whole, the Federal Bureau of Investigation estimates that a total of 1,433,812 "reportable offences" (comprising eight selected types of crimes) were committed in the United States during 1938. This represented an increase of 1.3% over the total of a similar estimate for 1937.

Crime in Cities, Towns and Villages.—For the ten-year period beginning with 1930, there was a gradual decline in all classes of reportable crimes, except for rape and larceny, which increased perceptibly. In addition, aggravated assaults and burglaries increased in 1939, as compared with their 1938 levels. Whether these recent changes foreshadow a return to the higher levels recorded in the first half of the decade, is as yet uncertain. Auto thefts continued their almost unbroken decline, and reached a new low.

The following comparisons are based upon returns from 1,964 cities, towns and villages in 1939; from 1,894 such communities in 1938 and 1,759 in 1937:

Offences Known to the Police
January-September, Inclusive; 1937-1939; Rate per 100,000 of Population

Offence	1937	1938	1939	Offence	1937	1938	1939
Murder and Non-negligent Manslaughter . . .	4.6	3.9	4.0	Robbery	40.0	42.4	40.7
Manslaughter by Negligence . . .	4.1	3.1	2.9	Aggravated Assault or Entering . . .	35.5	32.8	34.3
Rape	6.5	6.3	6.8	Burglary—Breaking or Entering . . .	237.4	243.0	259.4
				Larceny—Theft . . .	559.9	584.9	652.1
				Auto Theft	157.9	134.8	128.8

THE TYPE OF CRIME and where it was committed is speedily recorded on a new device invented in 1939 by a member of the Boston police department

It was again demonstrated in 1939 that there are fairly well-defined areas of both low and high crime frequency. The New England and Middle Atlantic States continue to have the lowest urban crime rates, with the South Atlantic, East South Central and Pacific Coast States reaching the highest levels.

With respect to the broad generalization that the larger the city, the higher the crime rate, 1939 showed an impressive consistency in the application of the rule. With all cities grouped according to size, the largest cities had the highest rates, and the others followed in regular order of descending scale. Group I cities (those having in excess of 250,000 population) and Group II cities (those having a population between 100,000 and 250,000), were as usual so nearly equal that a very slight change would affect their relative standing. Thus in 1937, Group I cities held the lead; in 1938, Group II cities went into first place by a narrow margin; and now in 1939, a slight shift has again placed Group I cities in the highest crime bracket. The other four groups followed in their usual order.

In 1939, the relative frequency of reportable offences showed the following crimes in a leading position; larceny, 57.7%; burglaries 23%; auto thefts 11.4%; robbery 3.6%. As compared with 1938, larcenies increased in relative frequency from 55.7%; the others listed above showed small declines. All of these, representing 95.7% of the total, are crimes against property involving unlawful gain as a motive. The rather small residue of 4.3% represents attacks upon persons, viz., homicides, rapes, and aggravated assaults. The following table presents the per capita rate of offences known to the police, for the first three quarters of 1939, in 1,964 cities, towns, and villages having a total population of 62,271,928:

Crime Rates per 100,000 Population
January-September, Inclusive, 1939
(000 omitted)

	Population Groups of Cities						Total
	I Over 250	II 100-250	III 50-100	IV 25-50	V 10-25	VI under 10	
Murder and Non-Negligent Manslaughter	4.5	4.5	4.3	3.0	2.7	2.5	4.0
Manslaughter by Negligence	4.0	3.2	2.1	1.5	1.4	1.5	2.9
Rape	8.2	5.7	5.1	5.6	5.0	6.6	6.8
Robbery	56.5	39.3	32.3	23.3	18.0	16.4	40.7
Aggravated Assault	36.2	40.1	40.2	30.1	26.3	17.3	34.3
Burglary—Breaking or Entering	281.5	324.2	268.1	253.2	195.0	172.2	259.4
Larceny-Theft	713.6	751.2	674.3	602.3	547.0	377.4	652.1
Auto Theft	157.7	156.1	122.2	114.1	82.6	61.0	128.8

The prominent position occupied by larceny in the foregoing table, and the gradual rise in the frequency of this crime during the past decade, invite a further breakdown of the total figures. The following brief tabulation shows a distribution of the value of property involved in larcenies, (not including auto thefts), during the first three quarters of 1939, as compared with the corresponding period of 1938:

Value of Property Stolen	Per Cent of Total Larcenies	
	1939	1938
Over \$50.00	11.8	13
\$5.00 and under \$50.00	64.9	65
Under \$5.00	23.3	22

The proportion of stolen property which was subsequently recovered, showed an increase during 1939. During the first three quarters of that year, 67.2% of the stolen property (in value) was recovered, as compared with 63.6% in the corresponding period of 1938, and 64.6% in 1937. A similar rise was shown with respect to the recovery of stolen cars. The number of cars recovered in 1937 and 1938 represented 93.5% of the number stolen. In 1939 the figure reached 96.0%.

Rural Crime.—Although the rural crime reporting area is much less developed than that for cities, towns, and villages, current data are collected in sufficient volume to justify the generalization that rural crime rates are lower than those of urban communities. Thus the direct relationship between population density and crime frequency, as noted above for urban places, is extended to rural areas as well.

But although all crimes are generally less frequent in rural than in urban areas, crimes against the person are relatively more frequent in the country. The relative standings for each class of reportable offence in 1938 are given below in terms of average groups of 100 urban and 100 rural crimes:

Offences against Property	Per Cent		Offences against the Person	Per Cent	
	Urban	Rural		Urban	Rural
Larceny	56.6	47.6	Aggravated assault	3.0	5.6
Burglary	22.7	29.0	Rape	.6	2.3
Auto theft	12.5	8.6	Murder	.3	1.4
Robbery	4.0	3.5	Manslaughter	.3	1.1

Similar urban-rural ratios are recorded annually in the United States, and have repeatedly been observed by commentators upon crime in Europe. The relative preponderance of rural murders, manslaughters, and rapes, as shown in the foregoing table, is especially pronounced. (See also CHICAGO; CRIME DETECTION; FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; POLICE.)

BIBLIOGRAPHY.—*Uniform Crime Reports* (quarterly) for 1938, and for the first three quarters of 1939 (Federal Bureau of Investigation, Washington); "Prisoners in State and Federal Prisons and Reformatories, 1937" (U.S. Bureau of the Census, 1939); "Judicial Criminal Statistics, 1937" (U.S. Bureau of the Census, 1939). (Br. S.)

Great Britain.—In 1937, the latest year for which complete statistics are available, the number of persons found guilty of offences of all kinds in Great Britain rose to 805,336, of which no fewer than 60% were for traffic offences; under 10% were in respect of indictable offences (*i.e.*, crimes), the remainder being non-indictable cases, including drunkenness (showing a rise to 52,425), betting, and offences against by-laws and police regulations. The daily average prison population was 10,562 (in 1938, 11,086).

Of the 77,529 persons found guilty of indictable offences, about one-half were adults (over 21); in the great majority of cases the charge was theft or fraud, 77% of these being in respect of property valued at under £5 and only 1% at over £100. Only 5% of the total were guilty of sexual offences or acts of violence against the person, among the latter being 78 cases of murder of 87 persons—the lowest since 1930. In 27 of these the murderer or suspect committed suicide, in one, he died through injuries received at the time of the murder, in two, he escaped, and in the remaining 48, arrests were made. Nine thousand, eight hundred and eighty-one persons were found guilty of "breaking and entering;" of these 39% were children under 14 and over 75% were under 21. Juvenile crime generally was on the increase; but most persons found guilty of indictable offences are casual offenders, and the "old lag," for whom crime is a livelihood, is becoming scarce.

In 1939, though figures are not complete, there was a considerable increase of indictable crime of a serious nature, attributable partly to the activities of the I.R.A. (Irish Republican Army), whose bomb outrages, in many provincial centres as well as in London, were met by the Prevention of Violence (Temporary Provisions) Act, passed in July. The "black-out" and the heavy call on the police to provide personnel for other essential services, as in air raid precautions, did not, as might have been expected, occasion any marked increase in petty crime in the early months of the war. In Sept. and Oct. 1939 the total number of crimes (mostly small thefts) in the Metropolitan area was 12,283 as

against 16,023 in 1938, cases of "breaking and entering" falling from 2,171 to 1,503 and of bag-snatching from 66 to 53. In the three months, Sept.-Nov., while larcenies from the person rose from 90 to 99 and thefts of bicycles by some 35%, house breaking and burglaries fell from 1,461 to 1,153. (L. H. D.)

Crime Detection. So that every phase of criminal investigation can be aided by scientific methods, groups of technicians equipped with laboratories are now employed by many law-enforcement agencies. Among the technicians employed are those who apply the science of physics to such problems as the identification of firearms and the determination of trajectory and force of projectiles. Like most of the technicians in the field of crime detection, they find the microscope and camera indispensable.

The chemist or toxicologist is called upon for such things as identifying poisons and stains, detecting unburned nitrates on the hand of an individual suspected of firing a gun, restoring serial numbers effaced from automobiles or firearms, and identifying and comparing innumerable substances that may assist in apprehending a criminal.

The examiner of questioned documents studies a variety of features of handwritings, typewritings, inks, papers, and other types and materials of writings for the purpose of solving problems of identification, sequence, and age. In examining wills, notes, checks, ballots, letters, and various documents, this technician employs microscopy, photography, and chemistry, as well as infrared and ultra-violet lamps and other scientific devices and procedures.

Biologists, botanists, geologists and metallurgists furnish invaluable aid in identifying or comparing substances discovered at the scene of a crime with material incriminatingly associated with a suspect. Physicians and pathologists are essential artisans in crime detection, for it is they who determine causes and times of deaths, the nature of injuries and suspicious illnesses. Psychologists and psychiatrists are consulted with increasing frequency for the purpose of determining the mental conditions of suspects and witnesses.

Prior to 1930 only the Police Department of Berkeley, Calif., employed a Polygraph (lie-detector). In 1939, 37 law enforcement agencies were given deception tests with an accompanying decrease in third-degree brutality. Banks, department and chain stores, and many other business institutions are employing the services of Polygraph operators to detect and prevent losses. Some organizations have all applicants examined as a means of determining their integrity.

Traffic studies and application of scientific methods of controlling traffic and preventing accidents constitute one of the most important of 1939 police-science contributions. Police are gathering evidence at accident scenes by the use of photography and the application of other scientific procedures. Chemical tests to determine intoxication were adopted by more than a score of departments during the year. The assignment of traffic patrolmen on the basis of accident records rather than by guesswork gained wide acceptance. Through pioneering efforts of outstanding police executives and university authorities, scientific procedures in all branches of police service have been adopted and advanced. (See also FEDERAL BUREAU OF INVESTIGATION.) (L. KE.)

Cristea, Miron (1868-1939), Rumanian patriarch and, at the time of his death, premier of Rumania, was born on July 20, the son of a Transylvanian farmer. After his consecration as bishop of Caransebes in 1899 he rose rapidly in the hierarchy of the Rumanian Greek Orthodox church until

IDENTIFICATION OF TYPEWRITER TYPE demonstrated at the annual re-training session of the Federal Bureau of Investigation in July 1939

he became Metropolitan primate in 1919. As patriarch after Feb. 1925, he was the spiritual ruler of the church's 13,000,000 communicants and a powerful influence in the nation's politics. Upon the death of King Ferdinand in July 1927, he became one of the triumvirate which ruled the country during the minority of Michael, until Carol returned from exile and seized the throne in 1930. Cristea was strongly opposed to a concordat with the Roman Catholic church, but as one of the regents he was obliged to sign the agreement after the Rumanian senate had approved it in 1929. During this period he publicly deplored all anti-Semitic activities—an attitude which he reversed ten years later when he became premier. Octavian Goga, his nephew, resigned as premier on Feb. 11, 1938, and Cristea was asked by King Carol to succeed him.

Cristea continued his predecessor's harsh measures against the Jews, though in considerably more diluted form; also under his Government the fascists led by Codreanu were ruthlessly suppressed.

Cristea died March 6 at Cannes, on the French Riviera.

Crop Control: see UNITED STATES: *The Farm Problem.*

Crop Insurance. An estimated production of 64,000,000bu. of wheat on 6,600,000ac. was insured in 1939 by the Federal Crop Insurance Corporation in the first governmental wheat crop insurance. Wheat growers in 30 States paid premiums in wheat or cash equivalent totalling 6,769,120bu. of wheat for 108,500 policies on winter wheat and 47,300 policies on spring wheat. Applications for policies were made by 205,000 growers in 22 winter wheat States and 100,000 growers in eight spring wheat States. Policies were issued, however, only on the payment of premiums in wheat or cash equivalent. Policies did not insure the price a farmer would receive, but insured only that he would receive in wheat 75% of an average crop. Payment of indemnities was in wheat or cash equivalent and amounted to 9,461,730bu., a loss of 2,691,610bu. or cash equivalent of about \$1,800,000 for the Government insurance corporation. Ninety-nine per cent of the farmers buying policies paid premiums in cash, which the insurance corporation converted into a reserve of wheat. For the 1940 wheat insurance program a more decentralized administration is contemplated and effort was made to

make the basis of averages more accurate, especially for States that recently suffered from recurrent droughts. Research is now being made by the Department of Agriculture, with a view of extending crop insurance to cotton, as suggested by the Federal Crop Insurance Act. The department's Bureau of Agricultural Economics has submitted a cotton crop insurance plan similar to that for wheat. (See House Document No. 277 of the 76th Congress, first session, which contains the bureau's report.) In its Aug. 26, 1939, number *Wallace's Farmer and Iowa Homestead* reported the results of an Iowa survey made by that farm magazine on the subject of crop insurance for corn. Farm owner-operators favouring corn crop insurance amounted to 51% in 1939 and 46% in 1938. Renters to the extent of 59% favoured such insurance in 1939 while 48% favoured it in 1938. (S. O. R.)

Crosley, Walter Selwyn (1871-1939), U.S. rear admiral, was born at East Jaffrey, N.H., on October 30. He was appointed to the U.S. Naval academy in 1889, received his commission as ensign in 1895. For bravery in action during the battle of Nipa Bay, Cuba, in 1898, he was advanced two numbers in rank. He saw service also in the Brazilian revolution of 1893, the Philippine insurrection of 1900, the West Indian campaign, the Haitian occupation of 1915, and the Dominican occupation of 1916. From 1910 to 1912 he was naval attaché at Constantinople and during the World War was attaché first at Petrograd, then at Madrid. In Nov. 1925 he was appointed U.S. Navy hydrographer, in which position he directed important surveys of Caribbean and other waters. He died at Baltimore January 6.

Cruisers: see NAVIES OF THE WORLD.

Cryolite. The only known commercial deposit of cryolite in the world is at Ivigtut, Greenland. Shipments in 1938 dropped 15% from 1937 to 44,000 metric tons, 23,000 tons to Denmark and 21,000 tons to the United States. In some years shipments have been made direct to Canada, but in general the Canadian demand is supplied by re-export from the United States, while Denmark supplies the rest of the world. Since cryolite is a necessary ingredient in the electrolytic bath for the production of aluminium, countries producing this metal are the chief consumers of cryolite, with the United States heading the list. Cryolite is also used in the manufacture of opaque glass, and small amounts are used in enamels, glazes, and insecticides. During recent years some manufactured cryolite has been used in the place of the natural product. (G. A. Ro.)

Cuba, a republic occupying the largest of the West Indian islands; language, Spanish; capital, Havana; president, Federico Laredo Bru; area, 41,634 sq.mi. excluding small neighbouring islands. Population (census, 1931) 3,962,344; (estimate, 1936) 4,108,650, including about 68% whites. The chief cities (with 1930 populations) are: Havana, 542,522; Santiago, 103,525; Cienfuegos, 87,699. The United States has a leased naval base at strategic Guantánamo bay.

History.—Cuba is under constitutional Government, with an elected president and bicameral congress. Since 1933, however, the personal prestige and political power of Colonel Fulgencio Batista, Chief of Staff of the Constitutional Army of Cuba, has been such that he has dominated the country, ruling it extra-constitutionally through the regularly elected officials. Growing dissatisfaction over the policies of the present administration, however, augmented by the badly depressed economic situation, caused the power of Colonel Batista to wane. He suffered the worst defeat of his political career in the November 15 elec-

tion of the Constituent Assembly, which met in December to begin drafting a new constitution. The Government parties elected 35 of the 76 delegates, while the opposition elected 41. Nevertheless, Colonel Batista gained prestige from one feature of the election, for general praise was given him, even by his opponents, for the honesty and fairness with which the Assembly election was conducted. The status of the Assembly from the legal standpoint was vague. Government adherents insisted that it had power only to approve a new constitution, while the opposition claimed that it represented the will of the people and should be the sovereign and supreme power in the nation in the period of its functioning. Further indications that Colonel Batista was losing popularity were seen by some in the reception accorded him upon his return from a good-will tour made to Mexico in February. There was a marked difference between the reception upon this occasion and the enthusiastic reception accorded him upon returning from his trip to the United States in 1938.

Uncertainties over the presidential elections in Feb. 1940, and the part Colonel Batista would play in them, were set at rest early in December, when he resigned as *Minister of War* and formally announced his candidacy for the presidency. He was nominated by five political parties, which united for the purpose as "The Social Democratic Coalition."

President Laredo Bru, on January 25, asked Congress to draft legislation to terminate the mortgage moratorium and to scale down all indebtedness. The bill drawn up, and known as the Mortgage Revalorization Law, provided that indebtedness contracted prior to 1931 should be reduced by 50% and debts contracted between that date and Jan. 1, 1933 should be reduced by 20%, and granted long repayment periods at low interest. The bill had the full support of Colonel Batista, but various groups made vigorous protests against the bill, charging that its passage would result in the destruction of Cuban credit, emigration of capital, paralysis of business, and the stoppage of further investments in Cuba. With such strong opposition evident, the President vetoed the bill.

Two trade treaties were ratified by the Senate in January. A treaty with Italy gave advantages to certain Cuban products in return for most-favoured-nation treatment with the exception of the United States. A similar "most-favoured-nation" treaty was made with Portugal.

Following the general plan of social improvement formulated by the Government, legislation was passed which provided for the regulation and control of rentals of dwelling houses. To compensate the landlords, new tax exemptions were laid down by the law.

In March, a day apart, died ex-President General Gerardo Machado and his successor, Carlos Manuel de Céspedes. Machado died in exile in the United States while Céspedes died in Havana.

The comic weekly *Zigzag* and the newspaper *La Prensa* were suppressed for causing the displeasure of Government officials. President Laredo Bru, however, signed a decree annulling the suppressions after the Supreme Court had held the action to be unconstitutional. When the German steamship "St. Louis" arrived in Cuban waters in May and attempted to discharge 907 Jewish refugees from Germany, the boat was refused permission to land its passengers on the ground their papers were not in order. President Laredo Bru ordered the ship to leave immediately, but fear of suicides among the despairing refugees caused the President to grant conditional permission to land the hapless people on the Isle of Pines, where they might stay in a temporary concentration camp. The decision came too late, however, as the ship had already begun the return trip to Germany, having found no other place at which it could discharge its passengers.

Upon the outbreak of the European war, President Laredo Bru issued a proclamation declaring that Cuba would maintain strict neutrality. The Government declared itself favourable to any

plan for collective neutrality of the Western Hemisphere. Later, the President asked Congress to grant him special emergency powers to cope with the problems resulting from the hostilities in Europe. Upon the Russian invasion of Finland in December, Cuba formally protested and expressed her sympathy for Finland.

A new tax law providing for the first income tax in the history of Cuba, and increasing a number of other taxes, was passed by both houses of Congress and sent to the President for consideration. Charges of profiteering by raising the prices of prime necessities were filed against a number of Spanish, Cuban, and Chinese merchants. To forestall any recurrences of such attempts, President Laredo Bru signed a decree September 9, setting maximum prices for certain essential foodstuffs.

Education.—During the 1937-38 school year 4,115 school-houses, with more than 8,300 classrooms, were in use as primary schools. The total enrolment was 423,420. It was estimated, however, that 4,000 more classrooms were needed to meet the educational demands of the country. Approximately 40,000 lunches and 30,000 breakfasts were served daily to needy children by the department of education. Reorganization of the 211-year-old University of Havana continued during 1939.

Army and Navy.—The Cuban Army numbers 15,000 men and officers, the rural guard 6,000. The navy includes 16 ships. Both army and navy have air services.

Finances and Banking.—The monetary unit is the peso, theoretically equivalent to the United States dollar. During 1939 its value declined and in December it was selling at a discount of approximately 10%. The budget for 1940 calls for \$75,992,000. The public debt as of Feb. 28, 1939, was \$141,278,000.

Trade and Communication.—Cuba has numerous good ports and regular, frequent external communication by steamship, with daily service from Key West, Florida. It is on the main route of the Pan American Airways, and enjoys excellent external as well as internal air transport facilities. Land communication is provided by a railway system (3,850 mi., including 250 mi. electric), based on an east-west trunk line, and by a highway network (2,500 mi. of improved roads), dominated by the 706-mi. Central highway, which runs the length of the island from Havana to Santiago. Telephone and telegraph facilities, with 52,740 telephones and 10,939 mi. of telegraph lines, are superior to those of any other Hispanic American country. There are 54 radio broadcasting stations in Cuba.

In 1938, imports totalled \$106,007,000, while exports totalled \$142,678,000, a favourable balance of \$36,671,000, and represented declines of 18.2% and 23.3% respectively. Approximately 76% of the exports were to the United States which, in turn, provided 70.9% of the imports. Great Britain was second in Cuban trade, providing 4.2% of the imports, and taking 13.8% of the exports. For the first time in many years Germany replaced Great Britain as the second largest source of Cuban imports.

The principal characteristic of Cuban exports in 1938, when compared with 1937, was a severe decrease in value but only a slight decline in volume. This was true, not only for the leading export commodity, sugar, but for virtually all the leading exports. In 1938, the shipments of raw sugar dropped only 2.3% in volume, but fell 21.4% in value; refined sugar exports declined 4.2% in volume and 22.6% in value. Raw sugar was exported to the extent of 2,587,945 tons valued at \$104,845,000, while 358,011 tons of refined sugar valued at \$22,441,000 were exported. The outbreak of the European war was momentarily cheering in some respects as it was felt that the result would be an increase in the exportation of sugar and an increase in its value, inasmuch as a large portion of European consumption is derived, normally, from the countries of Central and Eastern Europe. Moreover, Cuban sugar requires less time in transit to Great Britain than that from

most of the sugar-producing regions of the British Empire, including the Lesser Antilles. Presumptive increase in demand for Cuban sugar initially gave rise to great optimism in Cuba, with expectation of strong advances in price in the event of prolonged war. So, too, did the sugar panic of Sept. 1939 in the United States. Although seemingly of benefit to Cuba, the lifting of sugar quotas by the United States in September had an adverse effect, for under the reciprocal trade agreement between the United States and Cuba, the United States import duty was automatically raised from 90¢ to \$1.50 per 100 pounds. Consequently, such shortage as existed in the United States was filled largely from United States possessions and territories, as Puerto Rico, the Virgin Islands, and Hawaii, and Cuban sugar producers began to lose their principal market. Throughout the last months of 1939, the Cuban Government sought to reach some *modus vivendi* under which the lower tariff rate of the United States could be restored.

Tobacco is the export of second importance. Imports are foodstuffs, textiles, machinery, and other manufactured items. Tourist traffic to Cuba in 1938 comprised 158,013 tourists and excursionists, a smaller number than the record high of 178,396, set in 1937, but greater than the number arriving in 1936.

Agriculture and Mineral Production.—Cuba is primarily agricultural, with sugar, above all, and tobacco the outstanding crops, but intensive efforts at further diversification are being made by the Government. Overproduction of sugar resulted in an international agreement to restrict its production and the quota granted Cuba for 1939 was 2,696,517 long tons (2,240 lb.), that for 1938 was 2,950,000 long tons. All but 150,000 tons for local consumption were for export. The quota granted to Cuba by the United States for 1939 was 1,720,607 long tons, an increase over the 1,663,554 tons allowed in 1938. Coffee is increasing in importance, with 152,460 ac. planted, and an estimated production of over 71,000,000 pounds. To permit Cuban coffee to compete in foreign markets on equal terms with that of other countries an export subsidy is given. The exportation of fresh fruits and vegetables, principally tomatoes, was almost 21% less for 1938-39 than for the 1937-38 shipping season. From Nov. 1938, to May 1939, 62,039,546 lb. of fresh vegetables were shipped to the United States via the port of Havana. Cuba has valuable but undeveloped iron, oil, gold, and other mineral resources. Cuba produced \$136,126 in gold in 1938 as compared to \$37,660 in 1937, an increase of 262%. Further increases are not expected as the Congress failed to pass favourable mining laws. (See also WEST INDIES.)

Curaçao, a colony of the Netherlands, including the islands of Curaçao, Aruba, and Bonaire in the Leeward group, off the coast of Venezuela, and Saba, St. Eustatius, and St. Martin in the Windwards. Language: officially Dutch. Capital: Willemstad (pop. 27,231). The area of Curaçao is 212 sq. mi.; of the entire colony 436 square miles. Population (1937 official estimate), 94,945, with 60,883 on Curaçao, and 23,719 on Aruba. The colony is administered by an appointed governor and partially elected council. Upon the outbreak of European war in Sept. 1939, Curaçao became the haven of a number of German vessels. To protect the colony, the Netherlands Government took extensive precautions to insure safety against air raids, appropriating 2,000,000 florins for anti-aircraft defences. In 1937, the latest year for which statistics are public, imports aggregated 297,286,309 florins in value, a 50.8% increase (Venezuela, 75.4%; the United States, 12.8%; Colombia, 3.4%; and the Netherlands, 3%). Crude oil (principally from Venezuela) represented over 90%. Exports (1937) aggregated 269,943,953 florins, of which

petroleum and its derivatives represented 99½%, chiefly to Great Britain (32.8%), the Netherlands (10.2%), and the United States (12.1%), with 5,088,886 florins value in oil products to ships. Oil-refining is the chief industry, although Willemstad is assuming increasing importance as a transshipment point for cargoes bound for shallow ports in Venezuela. Phosphate production is likewise important, with exports valued at 873,404 florins in 1937. The monetary unit is the Netherlands florin (value: approx. 53.5¢ U.S.). The colony (1937) had 49 schools, mostly parochial, with total enrolment of 13,457. The population is over 75% Roman Catholic. (See also WEST INDIES.) (L. W. BE.)

Cushing, Harvey (1869–1939), American surgeon and neurologist, was born in Cleveland, Ohio on April 8. He graduated from Yale in 1891 then went to Harvard, where he received his master's degree and his medical degree in 1895. In that year also he began the practice of surgery, and in 1902 he was appointed associate professor of surgery at Johns Hopkins medical school in Baltimore. Ten years later he was named professor of surgery at Harvard medical school and surgeon-in-chief of the Peter Bent Brigham hospital in Boston, both of which positions he occupied until his retirement in 1932. In the early days of the World War (1914–18) he joined an ambulance service in France, served later with the British Expeditionary Force, and directed U.S.A. Base hospital No. 5. For these services he received the American Distinguished Service medal. In 1923 he was president of the American Neurological Association and of the American College of Surgeons. In 1933 he became the first Sterling professor of Neurology at Yale's school of medicine. Dr. Cushing was the world's foremost authority on surgery of the brain. He developed the technique of operating with local anaesthesia, was one of the first to recognize the importance of the X-ray in medical treatment, pioneered the study of the basal metabolic rate, and was the first to employ blood pressure determinations in the United States (1901). He was likewise internationally known for his studies in endocrinology, and his monograph, *The Pituitary Body and Its Disorders* (1912) is a classic in the literature of clinical medicine. His *The Life of Sir William Osler*, published in 1925, was awarded the Pulitzer prize as the best American biography of that year. Dr. Cushing, whose daughter Betsey married James Roosevelt, eldest son of President Roosevelt, died at New Haven, Conn. on October 7. See also *Encyclopaedia Britannica*, vol. 6, p. 902.

Cycling. Arie Van Vliet of the Netherlands was the only world champion to retain his title in cycling during 1939. He kept his world professional sprint championship by default after he and Josef Scherens of Belgium had reached the final of the competition at Milan, Italy.

In the heat to decide the championship, Scherens was injured and thus the title stayed with Van Vliet automatically.

War activities compelled the abandonment of many cycling events, among them those designed to produce the professional motor-paced and professional road champions. Thus the above-mentioned sprint crown was the only world professional championship contested for during the year. The world amateur sprint honours went to Jan Derkens of the Netherlands, who succeeded his countryman, Jan van der Vyver. George Shipman of Brooklyn took the national professional sprint crown, and Tino Reboli, Newark, retained the national professional motor-paced championship. The national amateur sprint laurels were won by Howard Rupprecht of Maplewood, N.J., Robert Stauffacher of San

Francisco took the national A.A.U. senior crown, and Eddie Caragnini became the National Cycling Association senior champion.

Despite the fact that the war situation curtailed certain international cycling events, there was an obvious upswing in cycling in the United States during 1939. The leading bicycle manufacturers reported tremendous advances in sales and predicted for cycling a return to its halcyon days around the turn of the century.

In New York, and in other progressive cities in the United States, city governments appropriated a total of well over several million dollars to be used to construct bicycle paths along popular highways and in the city parks. Several leading hotels opened bicycle bars to meet the growing popularity of the sport. (T. J. D.)

Czecho-Slovakia, a republic of Central Europe, had on Jan. 1, 1939, an area of 38,189 square miles. The population in this area amounted according to the census of Dec. 1930 to 9,807,096. The area was divided into three parts. The most western part, inhabited by a very large Czech majority, with a negligible minority of Germans living nowhere in compact settlements, consisted of Bohemia with an area of 12,525 sq.mi. and a population (always according to the census of 1930) of 4,472,354, and of Moravia with an area of 6,533 sq.mi. and a population of 3,332,522. Farther to the east, less densely populated and backward in its economic, social, and cultural life, was Slovakia, with a very large majority of Slovak inhabitants and small minorities of Hungarians and Germans. Its area amounted to 14,848 sq.mi., its population to 2,450,096. The most eastern part of the republic, at the same time the least densely populated and most backward one, was Carpatho-Ukraine or Ruthenia, the large majority of whose inhabitants were Ukrainians, sometimes called Ruthenians. Its area was 4,283 sq.mi., its population 552,124. The three peoples, the Czechs, the Slovaks, and the Ruthenians, were all three Slav peoples; the Czechs and the Slovaks most closely related and speaking and writing languages not more differentiated than dialects. The capital of the whole republic and of Bohemia and Moravia was Prague (Praha), the largest city,

VLADIMIR HURBAN, Czech minister to the U.S.A., refused to relinquish his legation to Nazi diplomats after Germany had absorbed his country on Mar. 15 and 16, 1939

situated in the centre of Bohemia. The capital of Slovakia was Bratislava, the capital of Ruthenia was Hust. Brno, the capital of Moravia, was the second largest city of the republic.

Czechoslovakia, as founded in 1918 as the result of a long struggle for independence of the Czech and the Slovak peoples, and of the victory of the democratic nations over the Central European empires, had undergone a profound change in the fall of 1938 as the result of the Pact of Munich and ensuing events. Czechoslovakia lost 16,056 sq.mi. of her territory with a population of 4,922,440. Of this area 11,071 sq.mi. with a population of 3,653,292 went to Germany; 4,566 sq.mi. with a population of 1,027,450 to Hungary, and finally 419 sq.mi. with a population of 241,698 to Poland. The name of the republic was changed to Czecho-Slovakia, and its constitution was re-written so that it now consisted of three autonomous parts (Bohemia and Moravia, Slovakia, Carpatho-Ukraine), giving each of the three component peoples a large measure of autonomy. At the same time, under pressure of National Socialist Germany and as the result of the abandonment by the western democracies, the constitution of Czecho-Slovakia lost its formerly democratic character. The Czechs, who had been the outstanding democratic people in Central and Eastern Europe, the only people there with a long-lasting and vital intellectual democratic tradition, were forced to accept a semi-Fascist regime and to curtail many of the democratic liberties which they had previously enjoyed. These Fascist tendencies became even more pronounced in more backward Slovakia where the peasant masses had not been trained for a democracy previous to 1918. By the force of circumstances the new Czecho-Slovakia found herself following by the end of 1938 in the political, economic and cultural orbit of National Socialist Germany.

At the beginning of 1939 the Czecho-Slovak Government was headed by Dr. Emil Hacha who had been elected president of the Republic on Nov. 30, 1938, and by a cabinet with Rudolf Beran as prime minister and Dr. Frantisek Chvalkovsky as foreign secretary. The cabinet represented the party of National Unity which had been formed in the fall of 1938 as a party uniting all the rightist and centre parties of the former regime in a strong semi-Fascist organization. The former Social Democratic Party was allowed to organize itself into an opposition group called National Workers Party, joined by progressive liberals and moderate social democrats, the Communist Party having been dissolved and outlawed immediately at the beginning of the new regime. The Government was faced by the difficult task of economic adaptation to the new situation. The country had lost about one-third of her industries, and more than two-thirds of her coal mines. By the amputation of her frontiers, her system of communications had been entirely dislocated. Railway lines and motor roads had to be rebuilt according to the new geographic conditions.

Soon it became clear that the solution found at Munich had been in reality no solution at all. The Czechs had expected that after cession of all the territory inhabited by Germans, and in addition to that a very large number of Czechs had been transferred to Germany, they would find themselves in a homogeneous and consolidated state. But the German Government continued to interfere in the Czech internal affairs. It did it after Munich much more than before, and Czecho-Slovakia was helpless against this continuously growing pressure. The tiny German minority, still living in Czecho-Slovakia, demanded not only special privileges and the constitution of a practically independent state within the state, but also a decisive influence upon Czech cultural, economic, and political life. The German Government demanded more and more the complete subordination of the still nominally independent Czecho-Slovakia to the economic and strategic needs of Germany and a complete co-ordination of the cultural and political outlook of the Czechs with the principles regulating the life of

EMIL HACHA, ex-president of Czecho-Slovakia, inspected a guard of honour in Berlin Mar. 15, 1939, during his visit to Hitler which resulted in his nation's extinction

National Socialist Germany. Strategically and economically, the wisdom of the frontiers laid down for Bohemia and Moravia by the Treaty of Versailles became completely vindicated by the events and experiences after the Pact of Munich. The so-called Sudetenland had not only formed a historical and geographic unity with the remainder of Bohemia and Moravia, but had been proven to be entirely indispensable economically and strategically to Bohemia and Moravia if the 7,500,000 Czechs were to lead an independent existence and not to be subjected to German domination. Soon it became apparent that the compromise established in Munich to Germany's advantage was not to last, as German demands were growing fast in their insistence upon the complete subjugation of Czecho-Slovakia.

For that purpose the Germans promised their support to some extreme elements in Slovakia who wished to achieve the complete independence of Slovakia and to sever all connections with the Czechs. This group of pro-National Socialist Slovak extremists under the leadership of men like Dr. Bela Tuka, Sano Mach, and Dr. Ferdinand Durcansky, would have had no chance of success without the direct support of Germany. In a similar way Germany had promoted the pan-Ukrainian movement in Ruthenia. In face of these treasonable plots the Prague Government decided to take a strong stand, to dismiss some of the ministers who were guilty of plotting with Germany and to name in their place other men ready to work for the new constitution of Federal Czecho-Slovakia. The efforts of the Prague Government seemed successful at the beginning, but were soon thwarted by the open support given by Germany to the extremists in Slovakia. The German Government seized upon this opportunity to declare that Czecho-Slovakia had entered into a state of disintegration. At the same time the German radio broadcasted again, as in Sept. 1938, completely unfounded reports about Czech aggressive intentions against Germany and described alleged disorders and brutalities against Germans in Bohemia and Moravia. The president of Czecho-Slovakia was summoned to Berlin. There Dr. Hacha signed in the night of March 14 a document according to which he requested the establishment of a German Protectorate over Bohemia and Moravia. Of course Dr. Hacha was in no way authorized by the Czecho-Slovak constitution to sign such a document, even

if the signature had not been obtained under pressure. On March 15 German troops moved with great rapidity into Bohemia and Moravia and occupied the whole country. Chancellor Hitler himself came to Prague on March 15 and spent the night in the ancient castle of the Bohemian kings, the famous Hradčany. On March 16 Chancellor Hitler issued a lengthy proclamation according to which Czecho-Slovakia had ceased to exist. He asserted that by reason of their greatness and their qualities, the Germans alone were fitted to maintain peace in the lands of Czecho-Slovakia, a peace which, by the way, had not been threatened nor disturbed by anybody but the Germans. By this annexation of Czecho-Slovakia Chancellor Hitler broke all the promises and guarantees which he had given at Munich. Bohemia and Moravia were incorporated as a nominally autonomous Protectorate into the Reich. Only the inhabitants of German race became, however, citizens of the German Reich. The others remained subjects of the Protectorate and were regarded as inferior in their status to German citizens. The Czech army was disbanded, German troops remained in occupation of Bohemia and Moravia. The foreign affairs of the Czechs were to be conducted exclusively by Germany. Bohemia and Moravia became a part of the German customs territory, and Germany took also complete charge of all means of communication and transportation and of the postal, telegraph and telephone services. The German Government reserved the right to take over any part of the administration and to put into effect any measures which it deemed necessary for its own interests. At the head of the Protectorate was to remain an official, approved by the Reich, with the title Head of the State. Dr. Emil Hacha was allowed to continue in this position. He has at his side a cabinet whose members, however, can occupy the office only with the agreement of the Reich. The real power is in the hands of the Reichsprotector, appointed by Chancellor Hitler, and his staff. In the middle of March the other constituent parts of Czecho-Slovakia changed also their status. Slovakia had proclaimed her independence as a republic on March 14, 1939. The new state signed on March 18, 1939, in Vienna a treaty with Germany according to which Germany guaranteed for a period of 25 years the independence and the boundaries of Slovakia. For that purpose Germany received the right to construct military works and to garrison German troops in certain strategic portions of Slovakia. Slovakia was declared at liberty to join the German customs union. At the same time Ruthenia, which on March 14 had made an ephemeral effort at proclaiming its independence, was occupied by Hungarian troops and incorporated into Hungary, where the new province was granted a certain limited autonomy. Thus Czecho-Slovakia ceased to exist. Her conquest was, however, not recognized by the democratic powers, among them the United States, Great Britain and France. The diplomatic and consular representatives of Czecho-Slovakia continued to function in these countries. The occupation of Bohemia and Moravia by the German troops was also a turning point in the general history of 1939.

Those circles in the democratic countries which so far had believed in the possibility of an appeasement of Germany and had been responsible for the conclusion of the Pact of Munich, now began to realize that there was apparently no limit to Germany's aspirations and that she was bent upon the subjugation of non-Germanic peoples. The conquest of Czecho-Slovakia became thus the point of departure for a policy of checking further aggression. The European war which broke out as the result of this effort aroused in the Czechs and in the Slovaks the expectation that the hour of liberation may come for them again, and that Czecho-Slovak democracy and independence may be revived. At the beginning of 1940 the fate of Czecho-Slovakia, as the fate of the whole of western civilization, depended upon the outcome of the

"STILL UNITED." A grim footnote to the disappearance of Czecho-Slovakia in Mar. 1939; by Eldermen of *The Washington Post*

war. The Czechs and Slovaks in the democratic nations organized themselves under a Czechoslovak National Committee headed by Dr. Edward Benes, to co-operate with the democracies in their fight for freedom.

Dairying. The trend in dairy production and herds accelerated to such an extent in 1939 that by Jan. 1, 1940, preliminary estimates of the number of heifers being saved for milk cows reached 5,800,000, a new peak and about 3% larger than on Jan. 1, 1939. This is a much larger number than needed for normal replacements in dairy herds in 1940 and 1941, and indicates still further increase in production of dairy products. The size of herds will depend on the rate of culling old cows, which rate was high in 1939 since the price for beef was high as compared with prices for butterfat. The prices for manufactured dairy products were lower in the summer of 1939 than for any time since 1933. Widespread drought in the autumn months reduced the milk flow considerably. Abundance of feed grains, forage and feed by-products, together with more favourable weather in late autumn, reversed this situation so that 1939 milk production was reported at somewhat higher than the 107,000,000 lb. production of 1938, which was 4% higher than that of 1937.

With the outbreak of war in Europe in September prices for dairy products advanced in line with the rise in other commo-

ties and the increased industrial activity. Ice cream, fluid milk and butterfat are the dairy products most directly affected by increases or decreases in urban prosperity. (See MILK and BUTTER for data on Government loans to the Dairy Products Marketing Association to support the price of butter in July, 1939, and for activities of control boards in urban milk sheds.) The peak in the number of milk cows on farms was in 1934. Owing to the droughts of 1934 and 1936 and to low prices the trend was downward until 1938, which year marked an upturn that was continued through 1939 to the extent of possibly making a new peak in 1940. Stocks of dairy products in 1939 were considerably smaller than in 1938 so that a generally more favourable situation for production prevailed at the outbreak of war.

Regardless of a possibly increased war demand for dairy exports, the World War (1914-18) demonstrated that war in Europe lessened imports of dairy products, principally cheese and butter, very materially. Imports of dairy products, in terms of milk, were 780,000,000lb. in 1914 but were only one-fifth of that amount in 1918. During the World War, the U.S. Department of Agriculture reports, "with this decline in imports and the rapid expansion in exports the United States shifted from a net import of dairy products amounting to about 400,000,000lb. per year in the period 1910-14 to a net export of 2,100,000,000lb., milk equivalent, in 1918." See E. E. Vial, "The Dairy Outlook for 1940," *The Agricultural Situation*, Nov., 1939, U.S. Dept. of Agriculture, pp. 22-24. (See also BUTTER; CHEESE; MILK.)

Dakar: see FRENCH COLONIAL EMPIRE.

Daladier, Edouard (1884-), French politician, of whom a biographical notice will be found in the *Encyclopædia Britannica*, vol. 6, p. 985. The son of a baker, he was educated at Lyons, was a school-teacher until the World War (1914-18), in which he served, retiring as a captain (*Croix de Guerre*, *Légion d'Honneur*). In 1919, he entered the chamber as a Radical-Socialist. Minister of war in 1925, president of the Radical Party since 1927, he formed in 1933 a ministry which lasted ten months, and then served under Sarraut and Chautemps. In 1934 he formed another Government which, as a result of the riots following the Stavisky scandal, lasted only a few days. Minister of war since 1936 in various *Front Populaire* Governments, in April 1938 he became prime minister.

He began the year 1939 with a tour of Corsica and the French North African colonies, calculated to show Italy that France had not the slightest thought of yielding to her neighbour's "justified demands." On March 18, after Germany's final dismemberment of Czecho-Slovakia, the chamber of deputies granted Daladier semi-dictatorial powers to rule by decree. After Mussolini's speech of March 26 in which he vaguely recommended that France should invite Italy to discuss the "problems" that divided the two nations (Tunisia, Jibuti and the Suez canal), Daladier called upon Il Duce, in an international broadcast, to declare his hand and clarify his demands; he repeated that France intended to yield not a square inch of her colonial empire. This speech was roundly applauded in France but drew no public answer from Mussolini. During the "war of nerves" that preceded the beginning of war in September, Daladier showed no signs of retreating from the strong position France and Britain had taken after the events of March. He merely reiterated his promise to march to the aid of Poland if that country were attacked, and on August 25 he reminded his countrymen that another surrender to force would leave France without friends and surrounded by enemies. Then he addressed an appeal, to Hitler, as "an old front-fighter," not to resort to war. The day after Germany invaded Poland, the chamber of deputies

voted Daladier the implied right to declare war, which he did after Berlin refused to comply with the terms of the French-British ultimatums. On September 13 he formed a war cabinet and took over the portfolio of foreign affairs. Daladier paid scant attention to Hitler's proposals for peace and formally replied to the Fuehrer's speech of October 6 before the Reichstag by declaring that France would continue the war until she had certain guarantees of security.

Dams. An increase of the activity of Governments throughout the world in the regulation and use of water is evidenced by the table on p. 197, which was condensed from a list of over 75 important dams recently completed or under construction in 1939.

The United States leads in this field with some of the largest dams. Grand Coulee, world's largest concrete dam, is more than 75% complete. The year's (1939) construction saw new concrete-placing records set as 20,684 cu.yd. went into the dam on May 25, to surpass the 15,844 cu.yd. set by the contractor for a 24-hr. period on the base of the dam in 1937. A new monthly record of 397,994 cu.yd. was established in August, only to be increased in September to 449,689 cubic yards.

The Central Valley project in California, with its two large dams, was the centre of attention. Shasta dam, second largest concrete dam in the world, was (Dec. 31, 1939) nearly ready for concrete pouring to commence, following extensive foundation excavation of over 3,000,000 cubic yards. The 28-ft. diversion tunnel has been completed and the Southern Pacific railroad has been temporarily routed through it. The final relocation of the railroad outside of the reservoir area requires 30mi. of new line, involving nearly 5,000,000 cu.yd. of grading, of which about 1,500,000 has been completed.

Construction of Friant dam, another large concrete structure for this project, was also started in 1939.

Investigations early in 1939 of the slide which occurred at Fort Peck dam Sept. 22, 1938, indicated that the weathered shale and bentonite seams in the foundation were too weak to hold up under the tremendous shearing force exerted by the dam. The situation was remedied by flattening the upstream slope of the dam. Although this change increased the total volume of earth required for the embankment by 22%, the placing of the hydraulic earth fill was completed. The remaining 25ft. of height will be built of rolled fill, taking the material needed from the downstream slope of the dam itself.

The Kingsley dam, second in size to Fort Peck, also being built by the hydraulic fill method, was in 1939 approximately 30% complete. The core pool was formed and the work proceeded at the average rate of about 300,000 cu.yd. of earth per week.

On the same river, the North Platte, the Seminole dam is already in service. At this site faulted areas were encountered under the dam and construction procedure necessitated cleaning out two large seams after the dam was partly built. Mining methods involving shafts, tunnels and drifts were used and the excavated material was replaced with concrete.

In Mexico, considerable progress was made on several large dams being built by the National Commission of Irrigation. A newly created body, the Federal Electric Power Commission of Mexico, has also started construction of a few small dams.

Conditions in Europe placed some restraint on dam building. In France, however, war needs lent impetus to hydro-electric developments such as the Genissiat project with its 330-ft.-high dam. This dam, under construction in 1939, is Europe's largest. In its proposal stage it attracted wide interest due to its similarity of

location and arrangement to Boulder dam in the United States. It appeared to be almost an exact replica on a smaller scale.

Some changes were made in the plans, such as placing the power houses across the river at the base of the dam instead of parallel to the river along the base of the canyon walls as at Boulder, but the resemblance is still remarkable.

The accompanying table gives data on 20 of the more important dams completed or under construction during 1939. (See also IRRIGATION; WATER POWER.) (W. P. C.)

Dance. Social dancing in America, during 1939, responded markedly to international influences. Three well-defined forces are discernible; namely, English importations, Cuban importations, and the European war crisis. The widespread popularity of the Lambeth Walk, which reached its peak late in 1938, waned in the early months of the new year; but such was its success, if short-lived, that other English dances were imported in its wake. In quick succession followed the Palais Glide, the Chestnut Tree, and the Booms-a-Daisy, none of which enjoyed the popularity of the Lambeth Walk. The Chestnut Tree is a "game dance," calling for pantomime on the part of the participants. It is danced (performed would be a more descriptive word) to a syncopated version of the widely known English nursery rhyme. Since the dance depended upon the tune, a decline in popularity of the tune pre-determined a similar fate for the dance.

In the summer of 1939, Arthur Murray imported still another English dance, the Booms-a-Daisy. Unlike its predecessors, this was danced to waltz time; but it was similar in that it was danced to a single tune and performers were called on to act out movements called for in the lyric.

Introduction of these new dances caused no diminution in widespread use of the waltz and fox trot. Nor was there any diminution of "jitterbug" dancing among the younger set. The Big Apple, or more correctly, the various acrobatic steps which comprised the Big Apple, were no longer being danced; but lively steps, similar in spirit and vigour, were popular among the avowed "jitterbugs"—ardent enthusiasts of "swing" music.

As the year went into its third quarter and war crisis bulletins began to pour into the U.S., there was a noticeable increase in dancing. It was the first manifestation of the country's jittery nerves and vividly recalled the dance craze which flourished immediately before and immediately after the outbreak of the World War. Open air public dances were particularly popular in 1939 and, some weeks before the New York World's Fair closed, they were staged daily, proving a successful attraction. New ballrooms

were opened to accommodate large crowds of dancers and New York witnessed its first "danceteria" in operation, three floors devoted to dancing and located at 42nd st. and Broadway.

The opening of the fall social season quickly revealed a definite trend toward such dances of Cuban origin as the rhumba and the conga. The rhumba was by no means a new dance but whereas heretofore it had been confined to higher economic groups simply because only the more expensive night clubs could afford to hire a rhumba band, it had by the fall of 1939 broken out of its confines.

Virtually a newcomer to America, la conga became an overnight dance sensation. It was accepted eagerly by dancers everywhere because it is simpler than the rhumba in execution and requires less dexterity. Moreover, it is a group participation dance—the performers forming a "line," one arm outstretched and hand rest-

THE OLD-FASHIONED SQUARE DANCE returned to popularity in the United States in 1939

"THE CHEMICAL BALLET," produced by chemists of Johns Hopkins university April 4, 1939, before the annual meeting of the American Chemical Society at Baltimore

ing on shoulder of the person in front—which adds to the merri-
ment. The increasing popularity of the conga led to the creation
by Arthur Murray of a new dance, the "Americonga," a combina-
tion of the Virginia reel and the conga, designed to give an Ameri-
can flavour to the Cuban dance. Before the year was out, the
Americonga was already experiencing a vogue. (A. Mv.)

Folk Dancing.—The year 1939 marked a high point in the still
rising tide of interest and activity in the realm of folk dancing
throughout the western world. The outstanding event of the year
was the Third International Folk Dance Festival and Scientific
Congress held in Stockholm, Sweden, from August 1 to 6. Fifteen
nations, including the United States, sent either dance groups,
speakers, or both.

These great International festivals in Europe have dem-
onstrated how large a part the social type of folk dance is playing
in the life of each nation. In nearly every European country there
is an organization or movement devoted to nurturing the folk
tradition. Important among them, in eastern and central Europe,
are: *Gyöngyös Bokréta* or Pearly Bouquet in Hungary; *Hrvatski
Seljački Pokret* (Croatian Peasant Movement) and *Skład* in
Yugoslavia; *Lyceon ton Hellenidon* (Lyceum of Greek Women)
in Greece; *Strajeri* in Rumania; and the *Théâtres Populaires* in

Poland. Important annual national festivals are held: for 12 days
in August in Budapest, Hungary; for the month of June in
Zagreb, Croatia; during May in Bucharest, Rumania; on August
4 at the stadium in Athens, Greece; and for a week in August in
the mountains in south Poland.

Since 1921, Denmark, Finland, Norway and Sweden have
united annually in a Nordic festival held alternately in the dif-
ferent countries. The societies guiding the dance movement in
these countries are as follows: for Denmark, *Foreningen til
Folkedansens Fremme*; for Finland, *Suomen Kansantanshuliitto*
and, also, Finland's *Svenska Folkdansring* for the Swedish speak-
ing group; for Norway, *Noregs Ungdomslag*; and for Sweden,
Svenska Ungdomsringen för Bygdekultur.

The English Folk Dance and Song Society holds a festival in
London every January which, in 1939, included groups from
seven other European countries. Scotland has its famous (High-
land) Braemar gathering in August.

The fostering folk societies in other European countries are as
follows: in Estonia, *Ülemaaline Eesti Noorsoo Ühendus*; in
Lithuania, a group at the University of Kaunas; in Italy, *Opera
Nazionale Dopolavoro*; in France, the Society of the Friends of
Popular Arts and the *Musée National des Arts et Traditions
Populaires*, Paris; in Germany, *Reichs Gemeinschaft der Deut-
schen Volksforschung Abteilung Deutsche Volkskunde*; and in
Switzerland, the *Fédération Suisse des Costumes Nationaux*. The
greatest of all Swiss dance festivals took place in August at the
National Exposition in Zurich.

Turning from Europe to the United States, 1939 finds a greater
number of people folk dancing than ever before in the history of
the country, and everywhere signs indicate continued increase.
This nation of many transplanted peoples is steadily growing
more appreciative of its folk inheritance.

Organizations of wide scope contributing to this expansion are
of greatly diversified character. Among them may be listed:
American Folk Dance Society, with headquarters in the Folk Arts
Center, New York, N.Y.; The English Folk Dance and Song
Society of America, with headquarters in New York, with affili-
ated centres in 12 cities, 11 additional affiliated groups, an annual
spring festival in New York and a summer school camp in Massa-
chusetts; National Folk Festival Association, holding its Sixth
Annual National Folk festival in Washington, D.C. in 1939; Folk
Festival Council in New York city, holding its eighth annual course
"Folk Dances and Songs of Many Peoples" at The New School
for Social Research; American Association for Health, Physical
Education, and Recreation, guiding the activity in schools and
colleges; National Recreation Association, conducting Institutes
throughout the country; Recreation Service of the Conference of
Southern Mountain Workers, holding its Fourth Annual Mountain
Folk festival in Berea, Kentucky; Co-operative Recreation Ser-
vice in Delaware, Ohio; Co-operative Society for Recreational
Education, conducting its Fourth Annual National School in Mill-
town, Wisconsin; Recreation Division of the Works Projects Ad-
ministration, co-ordinating and developing folk activity in many
States; Farm Bureaus, Granges, and 4-H Clubs; International
Institutes of the Y.W.C.A. and the National Institute of Immi-
grant Welfare, holding seasonal festivals and folk dance courses
in leading cities; International Houses of Berkeley, Calif., Chi-
cago, and New York; the American, Southeastern, and Texas
Folklore Societies; Camp Fire Girls; Girl Scouts of America;
Amalgamated Clothing Workers of America, with a department
of cultural activities serving a membership of nearly a quarter
million; and the Youth Hosteling movement with its chain of
hostels connecting 19 countries.

Additional noteworthy 1939 dance events include the Fifth
Festival of Nations of the International Institute, St. Paul, Minn.,

the Fourth Annual Dauphin County festival in Harrisburg, Pa., the Golden Gate Exposition festival in San Francisco, Calif., the Daily Mirror festival at the New York World's Fair, the Seventh Annual Folk festival in Vancouver, Canada, the Ninth Annual festival at the Traipsin' Woman's cabin, Kentucky, the Eighth Annual White Top festival on White Top mountain, Virginia, the 12th Annual Mountain festival in Asheville, North Carolina, and the 18th Annual Inter-Tribal Indian Ceremonial in Gallup, New Mexico; also, the year-round early American dance movement in the Detroit area conducted from Greenfield Village in Dearborn, Michigan. During the fall months of 1939, ground work was laid for the great Coronado Cuarto Centennial celebration of 1940 in New Mexico. (P. PA.)

Ballet, classic dance form and popular theatre art, felt the gathering war clouds of 1939 and suffered an almost complete black-out in Europe, its ancestral home, at the formal declaration in September, when many of its chief practitioners migrated to neutral United States, where receptivity has increased rapidly in the last few years, and a tendency to nationalize the art has steadily grown. In October, Massine's Ballet Russe arrived in New York with some difficulty, only in time to begin its fall season at the Metropolitan Opera House several weeks late.

Premières intended for the cancelled London season took place in New York: Massine's *Rouge et Noir* (Shostakovitch); Dali's surrealist *Bacchanale* (Wagner's "Venusberg" music); and Ashton's *Devil's Holiday*, scenario and score by Tommasini, on themes from Paganini. Massine's *Capriccio Espagnol* (Rimsky-Korsakoff) had its première in the spring season at Monte Carlo, with the Spanish dancer, Argentinita, collaborating in the choreography and creating the principal feminine role. The all-American *Ghost Town*, by Marc Platoff, was intended for American première in any case.

After a brilliant month in New York, this company began a five months' transcontinental tour. Massine, and other members, seeing no future for ballet in Europe for some time to come, took out citizenship papers, it is said. American dancers were added to the corps. Personnel of principals, with the exception of Panaieff at war, replaced by Eglevsky, remained as of previous season, i.e. Danilova, Markova, Slavenska, Krassovska, Theilade, Roudenko, Rostova, Youskevitch, Franklin, Zoritch, and the Americans, Platoff and Guerard.

Lichine of the former De Basil Ballet Russe, toured Australia with the division known as Educational Ballets, Ltd., then settled in Los Angeles, announcing that he was within one year of becoming an American citizen. Educational Ballets became known as the Covent Garden Russian Ballet during the London spring season, Colonel de Basil rejoining them as director. The company, now known as the Original Russian Ballet, Ltd., with almost the same personnel as last year and with De Basil as sole artistic director, sailed for Australia in December.

Living and working in California at least part of the year were Riabouchinska, Osato, Denisova, with Lichine; Baronova, making a motion picture sequence for M.G.M.; Verchinina, who rejoined De Basil's company for the London season; and Toumanova, who appeared in the stage musical, *Stars in Your Eyes*, in New York during the winter.

An ambitious new project of the fall season was the founding in New York of the Ballet Theater, an organization combining most of the big names outside of the active Russian companies. Three famous expatriates, long resident in the United States—Fokine, Bolm, and Mordkin—headed the list of choreographers. Added to a nucleus of Mordkin's company—Bowman, Conrad, Essen, Chase, Varkas and Romanoff, among the principals—were

the English visitors, Dolin, Tudor, Howard (dancers and choreographers), Laiing and Michael. For Americans, De Mille, Loring (on leave of absence from Kirstein's American Ballet Caravan) both dancers and choreographers, Gollner, Golden, Lyon, among others. Nijinska and Shabolevsky were later engaged. An elaborate program of new works, novelties and revivals, for the season opening Jan. 4, 1940, was announced.

The American Ballet Caravan started westward in October on its second transcontinental tour, with the new *City Portrait* (Loring) and *Charade* (Lew Christensen). The San Francisco Opera Ballet, directed by William Christensen, started eastward in November, playing engagements en route to Chicago. The Philadelphia Ballet returned for a second season at the Chicago City Opera. The Graff Ballet of Chicago made its first eastern tour.

The Polish Ballet, under Leon Woicikovsky, made a brief visit to the New York World's Fair, where the prospective dance season was otherwise voided by competing attractions and disturbed conditions in Europe. Thus the engagement of the Soviet Song and Dance Ensemble was cancelled.

TAMARA TOUMANOVA, formerly of the Ballet Russe, starred in the musical comedy *Stars in Your Eyes* which opened in New York city Feb. 9, 1939

In London, the Ballet Rambert carried on at the Mercury theater, in spite of war. The Vic-Wells Ballet, disbanding on the day war was declared, soon reassembled for a provincial tour, with tentative plans to carry on on a co-operative basis. The first performance of the Irish Ballet Production Society took place in Dublin in October.

The Ballets Jooss, intact as far as war was concerned, toured the British Isles in summer and early fall, with the new *Chronica* and *A Spring Tale*, reviving *The Green Table* by request after war began, and sailed for their fourth United States tour in December.

Trudi Schoop's Comic Ballet disbanded in the United States at the close of their tour in the spring, Trudi returning to Switzerland for a year's retirement, and several members of the company remaining in the United States.

Still the outstanding motion picture was *Ballerina*, starring Slavenska, Jean Benoit-Levy, director, which was made in France in 1938 and widely circulated in the United States in 1939. *On Your Toes*, with ballet background, and other Hollywood musicals, included ballet sequences. Experiments with ballet shorts and television continued without radical advancement. Ice ballets, on rink and screen, remained popular.

BIBLIOGRAPHY.—*The Book of Ballets, Classic and Modern*, edited by Gerald Goode, and profusely illustrated (1939); Arnold L. Haskell's *Balletoman's Album* (mostly pictures) (1939); Lincoln Kirstein's *Ballet Alphabet* (1939); and John Martin's *Introduction to the Dance* (1939). (M. L.)

Danish Literature: see SCANDINAVIAN LITERATURE.

Danzig, an important port on the Vistula river near the Baltic sea, was taken from Germany after the World War and created a free city—sovereign in some respects, controlled by Poland in others, and supervised by a high commissioner appointed by the League of Nations. Its area is 754 sq.mi. and its population 407,000, of whom 291,000 live in Danzig itself, the remainder in the surrounding rural districts. As Danzig had been under the Teutonic Knights from 1308 to 1454, under Poland from 1454 to 1793, and a part of Prussia from 1793 to 1919, it was furiously coveted by both Germany and Poland even after its establishment as a free city. Centuries-long emotional hatreds caused bitter German-Polish friction and constant appeals to the League of Nations for fifteen years after its separation from Germany.

With Hitler's coming into power in Germany in 1933 the conflict between the Nazis and the anti-Nazis in Danzig increased, but the German-Polish ten-year treaty of friendship of Jan. 26, 1934, agreeing that neither country would use force against the other averted open war until 1939. Meanwhile Poland's new port of Gdynia, founded soon after the World War, connected by railway with Warsaw, and favoured with Polish capital and railway rates, grew with such mushroom rapidity that it threatened economic disaster to the old Hanseatic city.

In Sept. 1938 Hitler signed the Munich Agreement, annexed the Sudeten Germans, and declared that he had no more territorial ambitions in Europe. Yet on October 24 he secretly demanded from Poland both Danzig and a strip of territory across the Polish Corridor to connect East Prussia and the Reich. On March 21, 1939, a week after he had completed the annihilation of Czechoslovakia by annexing Bohemia, Hitler repeated his demand. The Poles refused, fearing that compliance would simply mean the first step in the dismemberment of their republic. On April 28 Hitler denounced the German-Polish treaty of 1934. Nazis in Danzig began to smuggle troops and arms into the city as if in preparation for an armed revolt. To prevent this smuggling of weapons Poland increased her customs inspectors. This customs dispute became one of the factors which determined Hitler to invade Poland on

Sept. 1, 1939, and to announce that henceforth Danzig and the Polish Corridor were reunited with the Reich. Albert Forster, head of the Danzig Nazis, became District Leader (Gauleiter) of the city and the surrounding territory. (See also EUROPEAN WAR.)

See article DANZIG in *Encyclopædia Britannica*; and Ian F. D. Morrow, *The Peace Settlement in the German-Polish Borderlands* (Oxford Univ. Press, 1936). (S. B. F.)

Daranyi, Koloman (1886–1939), Hungarian statesman, was born at Budapest on March 22 and studied at Budapest university before joining the Imperial and Royal 13th Hussars as an officer during the World War. After the war he occupied various local political offices and in 1928 was appointed secretary of State. In Julius Goemboes' cabinet he was minister of agriculture (1934–36). Four days after Goemboes' death on Oct. 6, 1936 Daranyi became premier. His ministry was often caught in the political crossfire between pro- and anti-Nazi influences. He tried to placate the Nazis, notably by approving Hungary's first anti-Semitic law in March 1938, but the opposition successfully secured his resignation May 13, 1938, on the grounds that his Government had not proved its ability to withstand Nazi propaganda. Daranyi died at Budapest November 1.

Dartmouth College. During the 1939 academic year the faculty's new plan for regulating attendance of undergraduates at classes was given its first trial. There is now no allowance of "cuts" and the penalty for excessive absence from classes is discretionary with each instructor. It is recognized that the new regulations, which encourage self-discipline by the student, need longer experience before they can be truly evaluated, but the first year is judged successful.

Constant efforts are made by the faculty to effect improvements in the new survey course required of all freshmen, known as Social Science 1 and 2. The objective is to give the student in his first year a thorough acquaintance with the social sciences and a background of the world in which he lives. It is followed by a second year required of those students who do not plan to major in any of the social sciences. (S. C. HA.)

Daughters of the American Revolution.

The National Society, Daughters of the American Revolution, organized Oct. 11, 1890, makes eligibility for membership dependent upon direct descent from a patriot who aided in securing American independence. Membership Dec. 1, 1939, approximated 143,000 in 2,500 chapters in every State and in many countries.

Activities of 1939 included: publication in 18 languages and distribution of 304,000 manuals for citizenship, to aid in naturalization; instruction in right use of leisure and respect for rights of others of 117,000 children in Junior American Citizens clubs; gifts of \$86,000 for 16 approved schools for foreign-born, and Southern mountaineers. Improvements for these schools included a laundry, health house, completely furnished and endowed room; also annual gifts from the National Society of \$1,000 each to the two mountain schools on approved list entirely supported by D.A.R. funds. Loans were made to 721 students. Millions of Penny Pines were planted in all States of the Union in commemoration of the national society's 50th anniversary in 1940. Three social workers were maintained on Ellis Island. A high school girl from every State, winner as good citizen, was given a trip to Washington. Some 50,000 copies of *National Defense News*, designed to promote confidence in fundamentals of American democracy, were distributed and 3,000 medals for good citizenship were awarded. The Society publishes the *National Historical Maga-*

zine. A genealogical library and early American museum are open to the public in the Society's headquarters, Memorial Continental Hall, Washington, D.C. (S. C. Ro.)

Davies, John Vipond (1862-1939), American civil engineer, was born in Swansea, South Wales on October 13 and was educated at Wesleyan college in Taunton, England, and at the University of London. In 1889 he moved to New York city, where he was employed as an engineer, and five years later he established his own engineering firm of Jacobs and Davies. During his career as a consulting engineer, he designed and constructed four tunnels connecting New York city and Jersey City and Hoboken for the Hudson and Manhattan railway. He was also construction engineer for 26 aqueduct tunnels in Mexico and was one of the board of three which designed and built the Moffat tunnel near Denver, Colo. Davies died at Flushing, L.I., N.Y. on October 4.

Davis Cup: see TENNIS.

Dawson-Watson, Dawson (1864-1939), American artist, was born in London on July 21 and went to the United States in 1893 to become art director of the Hartford (Conn.) Art Society. Later he taught at Byrdcliffe colony, Woodstock, N.Y. and, for 11 years, at the St. Louis School of Fine Arts. Aside from his paintings in oil and water colours, he designed textiles and costumes and was a wood carver, mezzotint engraver, and scenic artist. He died at San Antonio, Tex. on September 3.

Deafness. The otologist's service for a hard of hearing patient has been greatly enhanced by the advent of the audiometer, an instrument to measure deafness. Formerly, the physician employed voice and whisper tests, tuning forks, reeds or similar devices, but now the multiple tone audiometer, in which frequency and intensity are controlled, enables the physician to diagnose hearing defects much better. Recently audiometers have appeared on the market that meet the requirements for acceptable audiometers adopted by the Council on Physical Therapy of the American Medical Association.

Hearing aids were improved considerably during the year 1939. The thermionic tube hearing aid is a new product and it bids fair to surpass the performance of other types of instruments. It is a miniature radio receiving set equipped with a small crystal microphone differing from the conventional hearing aid of the carbon granule microphone and the telephone circuit. For some conditions of deafness the carbon granule microphone hearing aid will probably not be replaced, at least for the present. The thermionic tube hearing aid is new and has not been tried very long. It may contain defects which are not discernible at the present time but may come to light in the future. The carbon granule microphone hearing aid, on the other hand, has been tried for many years and is perfected probably to the highest degree possible. To the normal ear the amplifying and intelligibility characteristics are superior for the thermionic tube hearing aid. Battery cost to energize the thermionic tube hearing aid at the present time is somewhat higher than that of the carbon granule microphone hearing aid. (H. A. C.)

Deaths (of prominent persons in 1939): see OBITUARIES.

Death Statistics. Since sickness statistics are far from complete, it is common to use death statistics to gauge health conditions in communities. Because communities vary in numbers of population, it is the practice to

compare death statistics in the form of death rates per 1,000 of population. According to official reports, there were 1,380,986 deaths in the United States during 1938; since the population for that year was estimated to have been 130,215,000, the death rate was 10.6 per 1,000 of population. In England and Wales, the death rate in 1938 was 11.6 per 1,000. These death rates compare very favourably with those for most countries of the world.

Among the few countries with death rates lower than those for the United States and England and Wales during the period 1936-38 are: Canada, with a death rate of 9.8 per 1,000; Denmark, 10.7; The Netherlands, 8.7; Norway, 10.3; Australia, 9.5; and New Zealand, 9.2. The following countries, among others, recently experienced death rates of 20 per 1,000, or more: Mexico, 23.0; Chile, 24.6; British India, 22.9; and Egypt, 27.5. In addition to these countries, there are many others with very poor health conditions which do not compile their death statistics. The death rates here cited, and those for several other countries, are shown in the accompanying table.

Death rates vary according to race, sex, age and marital status. Thus, among white persons in the United States during 1937, the latest year for which data by colour are available, the death rate was 10.8 per 1,000, while among coloured persons, it was appreciably higher, namely, 14.7 per 1,000. Considered in relation to sex, the death rate among males is higher than among females in most countries of the Western world. For example, white males in the United States had a death rate of 12.0 per 1,000 in 1937, while the figure for white females was 9.6 per 1,000. The corresponding death rates for England and Wales were 13.2 per 1,000

Average Annual Death Rates per 1,000 Total Population in Certain Countries for the Period 1936 to 1938 and for Each Year in the United States and in England and Wales from 1900 to 1938.

Country	Death rates per 1,000 1936 to 1938	Year	Death Rates per 1,000

(a) Average for 1935 to 1937.

(b) Average for 1934 and 1935.

(c) For years prior to 1933, the death rates relate to an expanding area within the United States.

males and 11.7 per 1,000 females. There is a striking variation in the death rate with age. According to the experience of the total population of the United States during 1937, the death rate was just over 50 per 1,000 babies in the first year of life, but fell rapidly at successive ages to a minimum of practically one per 1,000 children at age 10. The death rates per 1,000 then rose to 2.73 at age 20, to 3.85 at age 30, to 12.04 at age 50, and to 53.29 at age 70. When marital status is taken into consideration, it is usual to find, in Western countries, that the death rates are lowest among the married and highest for the widowed and divorced, while those for the single fall in between. An exception to this general situation is found at the early child-bearing ages, where the risks of maternity among married women are sufficient to bring their death rates to a level higher than that for the single, widowed or divorced women of the same ages.

There is a distinct gradation in the death rates in passing from the lowest to the highest social-economic classes of a community. In a study based upon the United States census of 1930 and death statistics for 10 States during that year, it was found that the death rates per 1,000 males between the ages of 15 to 64 in the several social-economic classes were as follows: unskilled workers 13.1; semi-skilled workers, 9.9; skilled workers, 8.1; clerks, proprietors, managers, and officials, 7.4; professional men, 7.0; and agricultural workers, 6.2 per 1,000. The low figure for agricultural workers calls attention to the low death rates in rural areas of the United States as compared with the urban communities; in 1930, white persons residing in rural areas had a death rate of 9.8 per 1,000, while those living in urban centres experienced a rate of 11.6 per 1,000.

Death statistics may also be analyzed according to the cause of death. Thus, the death rates from the ten leading causes of death per 100,000 total persons in the United States during 1937 were, in order of rank: heart disease, 268.0; influenza and pneumonia, 114.5; cancer, 112.0; cerebral haemorrhage, 86.5; accidents, 81.5; nephritis, 79.6; tuberculosis, 53.6; diseases of early infancy and congenital malformations, 49.0; diabetes mellitus, 23.7; and arteriosclerosis, 17.1. These ten causes of death accounted for 78.9% of the deaths from all causes.

There has been a steady decrease in the death rate in most Western countries since about the middle of the 19th century; the improvement has been particularly marked since 1900. Thus, in England and Wales, the death rate fell from 18.2 per 1,000 in 1900 to a minimum of 11.4 in 1930; following a slight rise to 12.4 in 1937, it dropped to 11.6 in 1938. In the United States, the death rates per 1,000 fell from 17.6 in 1900 to a record low of 10.6 in 1938. However, current reports indicate that there may be a slight rise in the death rate for 1939. Figures for the years from 1900 to 1938 are shown in the table on p. 201.

Aside from any other factors, the distribution of the population of a community according to age influences its death rate. Two communities may have identical death rates at each age of life, but the number of deaths of persons of all ages, per head of total population, may differ appreciably between the two communities, simply because one of them may happen to have a larger proportion of aged persons than the other. To overcome this difficulty, death rates may either be "standardized" to allow for the effect of variations in age distribution, or comparisons may be based upon the average length of life, which is also known as the expectation of life at birth. This figure is obtained from a computation which is based upon death rates at each age of life without being influenced by the age distribution of the community.

Sweden has the longest series of figures for the average length of life. Whereas males in that country had an average length of life of only 33.20 years in 1755-76, the figure increased steadily to 63.22 years in 1931-35.

The average length of life for white persons in the United States is much the same as that for England and Wales. In 1937, white males in the United States had an average length of life of 60.75 years and white females of 65.08 years, while the corresponding figures in England and Wales in 1937 were 60.18 years for males and 64.40 years for females. Figures for the average length of life in other countries are shown in the accompanying table.

Delaware, one of the 13 original States, popularly called the "Diamond State." Area, 2,399.2 sq.mi. (land, 1,961.7; water, 437.5) (see *Delaware Notes*, 12th ser., p. 111). Population (1930), 238,380. Capital, Dover, 4,800. The only larger city is Wilmington, 106,597. Public school attendance (Sept. 1939), 42,454.

History.—The 1939 legislative session, continuing intermittently until August, was marked by dissension between a Republican legislature and the holdover Democratic administration. "Ripper" legislation, passed over Democratic Governor McMullen's veto, gave the Republicans control of the New Castle county election machinery, and, after a contest in the courts, of the politically-important State Highway Department. The Democrats could do little in reprisal except hold up some appropriation bills.

The veto in April of a bill enabling Wilmington to legalize Sunday movies inspired agitation for the repeal or enforcement of Delaware's old "blue laws." Surveys by Wilmington police during the summer disclosed technical violations by the hundreds every Sunday—even the investigators were law-breakers in driving their cars on the Sabbath. Charges were brought against two merchants in December. State taxes on admissions and pari-mutuel betting at Delaware Park race track during its first three years of operation (1937-39) yielded \$818,000.

Business and Industry.—At the year's close Babson estimated current Wilmington business as 25% better than in 1938 (national average, 20%). For November New Castle county industrial employment was up 19%, payrolls 28%, above Nov. 1938. In the first nine months of 1939, passenger automobile sales increased 39%, refrigerators 43%, life insurance 27%, electricity output 19%, over a like period in 1938. Building in Wilmington totalled \$5,470,000, the best year since 1929 and almost double 1938's figure. Suburban residential construction flourished. From 1935 to Nov. 1939 3,838 families moved into the Wilmington area, mostly to the suburbs. A new industrial era for southern Delaware (still largely agricultural) began with the opening December 15 of the duPont Company's \$8,500,000 nylon plant near Seaford, to employ about 850 workers. (The Company applies the generic term "nylon" to a group of new synthetic polyamides which can be drawn into fibres, bristles, and other forms of great strength and elasticity.) Nylon "intermediates" are brought from a duPont plant in West Virginia to Seaford for processing into commercial forms, chiefly, at present, yarn for hosiery knitters.

Delaware agriculture registered a modest advance; 1939 cash income was expected to exceed 1938 by 5% to 10%, but to fall short of 1937. For the fiscal year ending June 30 Delaware received \$9,716,000 from the Federal Government for relief, pensions, agriculture, highways, etc. PWA grants of \$1,185,000 made possible a construction program costing nearly \$3,000,000. Largest project was a new building and additions to the library of the university, finished in December. Improvement of the year was trackless trolleys for Wilmington. The changeover from rails to rubber began in August 1939, was planned for completion in Jan. 1940.

Democracy is not only a technique of government, based upon freely elected representative institutions and upon an executive responsible to the people; it is based upon the fundamental assumption of the equality of all individuals and of their equal right to life, liberty (including the liberty of thought and expression), and the pursuit of happiness. The denial of this equality and individual liberty is characteristic of fascism, which has risen during the last years as a conscious and aggressive opponent of democracy. The victories which the resolute and ruthless policies of fascism accomplished, especially in the field of international relations, resulted in a revitalization of democracy in the democratic countries. This new strength expressed itself not only in the internal field. As far as elections were held during 1939 in democratic countries, they increased everywhere the strength of the democratic and liberal parties. The small and often rivalling fascist groups in the democratic countries were reduced to complete insignificance. On the other hand the communist parties and fellow-travellers who until the middle of 1939 had emphasized their willingness for co-operation with the democracies against fascism turned, after the conclusion of the pact of non-aggression between the Soviet Union and National Socialist Germany, against democracy. Their sudden turn-face cost, however, the sympathy of many democratic and liberal circles who had supported the idea of a common popular front of progressive and radical elements. On the whole, fascist and communist attacks upon democracy led to a reappraisal and a reassertion of the fundamental attitudes and truth inherent in the democratic position. This new strength expressed itself also in the field of international relations. Until 1939 the irresoluteness and the lack

of co-operation of the democratic powers had led, through a policy of neutrality and non-intervention, to the triumph of fascist aggression and to the collapse of the League of Nations. The year 1939 saw a fundamental change in the attitude of British and French democracy. The two nations abandoned the policy of isolation which they had pursued for the last years. Their effort to check fascist aggression involved them in the war which broke out in Sept. 1939. Thus they started to establish a close co-operation of the democracies in international affairs which alone can make a democratic world safe for democracy. It was generally realized that the effort for the protection of democracy and for the checking of aggression, which was undertaken by Great Britain and France in the European war, would have lasting results only if it would lead to some organized and permanent form of international co-operation. The well advanced and growing co-operation between Great Britain and France promised to develop into the nucleus of such a future organization. It may be a rejuvenated League of Nations, this time backed by the will of the peoples to establish collective security and to abandon isolation. At the beginning of Dec. 1939 the League of Nations assembled for the purpose of taking a stand against the aggression of the Soviet Union against Finland. In 1939 an American journalist, Clarence Streit, proposed in his much discussed book, *Union Now*, the establishment of a federated government among the democracies, following the example of the 13 North American States at the end of the 18th century. Generally it may be said that a new will grew up to apply democracy to the international field and thus to make democracy secure internally.

An International Congress of American Democracies opened at Montevideo in March for the purpose of forming an inter-American organization to combat fascism and race hatred in all their ramifications. The Argentine government issued a decree according to which all organizations must be organized on a democratic basis and are forbidden to wear uniforms or insignia. (See also COMMUNISM; FASCISM; FRANCE; GREAT BRITAIN; PACIFISM.)

Democratic Party. As 1939 opened, the Democratic party continued in control of the executive and legislative branches of the National Government. The elections of the preceding November, however, had reduced its huge majorities in House and Senate. When the 76th Congress convened on January 3, the Democrats held 69 Senate and 262 House seats, as compared with 75 and 333 respectively in the 75th Congress. Postmaster General James A. Farley remained as chairman of the Democratic National Committee. In the House, William B. Bankhead of Alabama held office as Speaker, with Representative Sam Rayburn of Texas as floor leader. Senator Alben W. Barkley of Kentucky continued as Democratic Senate leader.

Reflecting the conservative trend of the 1938 elections, many Democrats in Congress evidenced a more critical attitude toward the New Deal. It soon became apparent that the President, despite the Democratic majorities in Congress, would have trouble in securing the enactment of his legislative proposals. On many issues the Democrats were sharply divided.

Though Administration leaders in Congress succeeded in blocking amendments to the Wage-Hour and Labor Relations Acts, they failed to defeat a House Resolution, offered by Representative Howard W. Smith, Democrat of Virginia, to investigate the National Labor Relations Board, and they were unable to prevent the enactment of the Hatch bill to prohibit "pernicious political activities" by Federal office-holders. Many Democrats joined with the Republican minority in voting for the NLRB investigation and the Hatch bill.

In a letter to Senator James F. Byrnes of South Carolina, on June 21, 1939, President Roosevelt proposed a \$3,000,000,000 "spend-lend" program, to include self-liquidating loans by Federal agencies over periods ranging from two to seven years. As part of his new "pump-priming" plan, the President also asked Congress to increase by \$800,000,000 the borrowing-lending power of the United States Housing Authority.

As finally passed by the Senate on July 31, by a vote of 52 to 28, the spend-lend bill had been whittled down to an authorization of \$1,615,000,000. On August 1, a coalition of House Republicans and independent Democrats caused the rejection of a resolution calling for immediate consideration of the bill. The vote was 193 to 167. This action killed the spend-lend measure for the session. Though the Senate approved a bill to increase the lending power of the USHA, the House on August 3, refused to take it up before adjournment, another major reverse for the Administration. On January 17, in letters to the Chairmen of Senate and House committees, the President asked legislation to construct the Florida Ship Canal and complete the Passamaquoddy tidal power project, work on which had been halted by Congress in 1936. The Administration met defeat again when the Senate, on May 17, rejected a Florida Ship Canal bill by a vote of 45 to 36. Neither House considered the Passamaquoddy bill.

Though Congress voted \$2,539,805,000 for relief, only \$50,000,000 less than the amount requested by the President, it eliminated the theatre and art projects, and wrote into the bill drastic restrictions. Following charges that WPA funds had been used for political purposes, the House Appropriations Committee made an investigation of the administration of Federal relief.

In the acceptance by Congress of the large National defence program submitted by the President, the Administration won its most important single victory of the session. Congress, however, rejected a proposal to spend \$5,000,000 in developing the harbour at the island of Guam in the western Pacific. Early in the session, Congress approved a modified Government reorganization measure. In 1938, in a major set-back for the Administration, Congress had rejected a more comprehensive Government reorganization bill. Many Democrats joined with the Republicans in opposing the extension of the President's monetary powers. After a series of defeats for the President, Congress adjourned on August 5. Following the outbreak of the European war, the President on September 13, called Congress to meet in extra session to revise the Neutrality Act. After an extended debate, it repealed the arms embargo and approved a "cash-and-carry" Neutrality Act. Many Democrats who had opposed other Administration measures, supported its neutrality proposals. On October 1, Alfred E. Smith, Democratic candidate for president in 1928, who had opposed the New Deal in 1936, called on the Nation to stand behind the President in his fight to repeal the arms ban. As the special session ended on November 3, the President had done much to regain control over his party in Congress.

Though the President remained silent as to his 1940 intentions, the third term question was much discussed during the year by Democratic leaders. Secretaries Ickes, Wallace, Attorney General Murphy, and several high Administration officials, and many party leaders urged the President's renomination. On August 17, Senator Frederick Van Nuys, Democrat of Indiana, declared that 15 Democratic Senators would oppose a third term for the President.

On August 23, Speaker Bankhead declared his willingness to run for the presidential nomination, if backed by his own State. On December 16, Vice President Garner, from his home in Texas, formally announced his candidacy for the Democratic presidential nomination. Paul V. McNutt, Federal Security Administrator, was also an active candidate for the nomination. He let it be known, however, that he would support the President, if the latter sought

"SOMETHING WRONG WITH THE MAGIC." A reference by Thomas in *The Detroit News* to Roosevelt's Jackson Day speech Jan. 7, 1939, in which he invited dissatisfied Democrats to leave the party

renomination. On December 30, Chairman Farley issued a call for the Democratic National Committee to meet in Washington on Feb. 5, 1940 to select a city, fix the time, and make other preliminary arrangements for the National convention. On the same day, it was revealed that several Republican leaders in Congress, with the approval of the President, had been invited to attend the Democratic Jackson Day Dinner in Washington on Jan. 8, 1940. Among those invited were Senators Charles L. McNary of Oregon and Warren R. Austin of Vermont, Republican leader and assistant leader in the Senate, and Representative Joseph W. Martin, Jr. of Massachusetts, House Republican Chief.

(O. McK.)

Denmark. Area 16,575 sq.mi.; population (est. June 1937) 3,749,000. Chief towns (pop. 1935 census): Copen-

DENMARK: Industrial production. Monthly Index, partly adjusted for seasonal variation (*The Annalist*)

hagen (843,168), Aarhus (90,898), Odense (78,403), Aalborg (48,132). Ruler, King Christian X; language, Danish; religion, Christian (Lutheran).

History.—Denmark endeavoured throughout 1939 to maintain and consolidate her policy of strict neutrality and all deliberations with the other northern countries and the Oslo powers were to this effect. The Socialist and Radical Stauning-Munch government celebrated its ten years of power after a new election victory on April 3 which gave the two parties together 52.4% of total votes as compared with 55.3% in 1935. Proposal for a constitution involving abolition of the Landsting and lowering of the franchise age from 25 to 23 was rejected by a referendum on May 23 which gave slightly less than the necessary 45% of the electorate. The government expressed readiness to conclude a non-aggression pact with Germany and the pact was signed on May 31 in Berlin. It was agreed upon in a protocol that Denmark was entitled to maintain normal trade relations with a country at war with Germany and this was on the other side recognized in principle by the Allies after the outbreak of war. Crown Prince Frederick and Crown Princess Ingrid toured the United States before opening the Danish and Icelandic pavilion at the New York World's Fair. They passed through London on their outward journey on March 13, and on their way home on May 16.

In August Germany and Great Britain had declared that they would respect Denmark's neutrality. In the first six months of the year production and trade increased, but the war hit Denmark's economy hard. The index of prices for imported goods went up from 113 in August to 156 in November while the corresponding index for exported goods only increased from 110 to 125. In December a delegation headed by Prince Axel visited London to

initiate trade negotiations with the British government.

(E. B.-P.N.)

Education 1938.—Primary schools 4,104; scholars 407,877; secondary schools 368; scholars 72,028.

Defence 1939.—Army—compulsory service—national militia 14,000; navy—2 coast defence; 8 submarines; aeroplanes 65.

Banking and Finance.—Revenue, ordinary (1938-39) 531,796,000 kroner; (est. 1939-40) 535,400,000 kroner; expenditure, ordinary (1938-39) 525,403,000 kroner; (est. 1939-40) 531,200,000 kroner; public debt (March 31, 1938) 1,255,067,000 kroner; notes in circulation (July 31, 1939) 424,519,000 kroner; gold reserve (July 31, 1939) 117,450,000 kroner; exchange rate (average 1938-39) 22.40 kroner=£1 sterling.

Trade and Communication.—External trade (merchandise): imports (1938) 1,623,900,000 kroner; (Jan.-Aug. 1939) 1,128,900,000 kroner; exports (1938) 1,533,900,000 kroner; (Jan.-Aug. 1939) 1,031,600,000 kroner. Communications and transport: roads, suitable for motor traffic (April 1, 1938) 4,871 mi.; railways, open to traffic (1938): state 1,491 mi.; private 1,553 mi.; airways (1938): passengers 42,843, freight carried 314 metric tons; mail 231 metric tons; shipping tonnage (Jan. 1, 1939) 1,232,667 gross tons; tonnage launched (Jan.-June 1939) 61,800 gross tons; motor vehicles licensed (Dec. 31, 1938): cars and commercial 150,778; cycles 29,324; wireless receiving set licences (1938-39) 713,215; telephone subscribers (Dec. 31, 1938) 366,559.

Agriculture and Industry.—Production 1938 (in metric tons): number of pigs slaughtered 3,915,000; barley 1,383,700; rye 1,163,600; wheat 469,800; oats 287,600; potatoes 1,455,600; butter 189,400; beet sugar 182,600; margarine 81,252. Industry and labour: industrial production (1929=100) (average 1938) 135.0; (Aug. 1939) 148.0; aggregate number of hours worked (1931=100) (av. 1938) 132.0; (Aug. 31, 1939) 148.4; number of applicants for work (average 1938) 112,241 (21.4%); (Aug. 31, 1939) 72,328 (12.6%).

Dental Association, American: see DENTISTRY.

Dentistry. Activity was notable particularly in the work of the National Health Program Committee of the American Dental Association; in the acceleration of the Dental Health Education programs throughout the country; in the vigorous discussions of new plans of dental education; and in the accomplishments in dental research. The American Dental Association has adopted certain principles for the participation of organized dentistry in any national health program. They are:—

- (1) In all conferences that may lead to the formation of a plan relative to a national health program, there must be participation by authorized representatives of the American Dental Association.
- (2) The plan should give careful consideration to: first, the needs of the people; second, the obligation to the taxpayer; third, the service to be rendered, and fourth, the interests of the profession.
- (3) The plan should be flexible so as to be adaptable to local conditions.
- (4) There must be complete exclusion of non-professional, profit seeking agencies.
- (5) The dental phase of a national health program should be approached on a basis of prevention of dental disease.
- (6) The plan should provide for an extensive program of dental health education for the control of dental disease.
- (7) The plan should include provisions for rendering the highest quality of dental service to those of the population whose economic status, in the opinion of their local authorities, will not permit them to provide such service for themselves, to the extent of providing prenatal care, the detection and correction of dental defects in children, and such other service as is necessary to health and the rehabilitation of both children and adults.
- (8) For the protection of the public, the plan shall provide that the dental profession shall assume responsibility for determining the quality and method of any service to be rendered.

THE DANISH CROWN PRINCE FREDERICK and Crown Princess Ingrid at a reception in Denver during their tour of the United States in 1939

In an effort to be constructive, the committee offered the following proposals by which a national health act can be made beneficial to the people of the nation:—

- (1) All Federal health activities, with the exception of military services, should first be combined in one agency.
- (2) A national health bill should consider and make use of the principles established by the House of Delegates of the American Dental Association.
- (3) A separate title should be devoted to dentistry in any national health legislation in order to: (a) make provision for the essential differences between dentistry and other health services, and (b) augment with a comprehensive research program the efforts of the organized dental profession to determine the cause of dental diseases.
- (4) The following dental program should be carried on until the discovery of the cause of dental diseases enables a more informed attack on the problem:
 - (a) A program of preventive dentistry for children that would be based on the present knowledge of the subject, in order to decrease the future accumulation of dental disease. This would include a development of the educational program, initiated by the American Dental Association, to preserve the natural teeth and to teach both children and parents the importance of preventive dentistry during the prenatal, infant, pre-school, and school periods.
 - (b) A program of education for dentists to make available to them the latest advances in preventive dentistry as they are revealed through clinical experience and research.

Dental Health Education Programs.—The American Dental Association for the past 20 years has conducted a program of education for the laity. Most of the Association's efforts are directed at the prevention of dental decay. The Association's educational activities embrace five fields: (a) elementary and high schools, (b) radio, (c) newspapers and magazines, (d) the lecture platform, and (e) the private dental office. In addition to the dental health education activities of the American Dental Association, numerous State dental associations, State departments of health, and private agencies have been conducting enlarged programs in this field. In Massachusetts it has been done by pictures with brief but telling titles. A program of dental service to children has been begun in 40 States. Twenty-nine States employ dentists on the staff of the State health department, and 22 States pay local dentists for service in the maternal and child health programs. With a few exceptions, the programs have been limited to educational and prophylactic activities. In 13 States, corrective work has been undertaken in limited areas.

New Plans of Dental Education.—The tremendous prevalence of dental disease has been repeatedly pointed out. Surveys by varied and numerous agencies have all indicated this. The statement that 98% of all U.S. children have dental caries and 75% of all U.S. adults have pyorrhea has become almost trite. Millberry suggests as a new plan in dental education the training of skilled technicians who will be a responsibility of the fully trained licensed dentist. One new development in dental education, that of training dental men in public health, has received general approval. At least two universities are offering such courses, and the outlook is very bright.

Accomplishments in Dental Research.—The Research Commission of the American Dental Association has just published a book on "Dental Caries—Findings and Conclusions on its Causes and Control." It contains summaries of the work of 195 investigators in 25 countries, with 75 educational, scientific, or health service institutions represented. There is rather general agreement that the cause of dental caries is not really known and that there is no specific cause.

Vitamin Research.—Vitamin B and B₁ attracted especial attention during 1939. The treatment of certain types of neuralgia by large doses of vitamin B₁ has met with sufficient success to warrant the hope that along this road may be found the means of putting to rout that devastating pain in the trigeminal nerve, called tic douloureux. Experiments in rats, carried on by Lee and Sure, in which there was a vitamin B₁ deficiency, discovered a most regular and marked degeneration of myelin in the trigeminal and sciatic nerves. Williams and Spies contend that "the most

constant and striking symptoms of a vitamin B deficiency arise from degeneration in the nervous system." Riboflavin (vitamin B₂ or G) also must not be disregarded by the dentist. Sebel and Butler have pointed out that lesions in the corners of the lips that frequently are difficult to heal may be due to a riboflavin deficiency.

Sinclair has made this interesting observation: "In administering large doses of vitamin B complex, which contains B₁, I have noted regularly the disappearance of the extreme hypersensitivity to the dentin to instrumentation and thermal changes, and also of soft parts to instrumentation and to the hypodermic needle."

Sinclair's further statements should attract the attention of the dentist: "There is no special clinical test available for determining a vitamin B complex deficiency. In the dietary history and symptomatology, the lesions of the mouth and oral mucosa are outstanding." This suggests the need of active investigations in this area. (See also VITAMINS.)

Hormones.—Nathanson and Weisberger reported on "The Treatment of Leukoplakia Buccalis and Related Lesions with Estrogenic Hormone." The oestrogens were administered to patients in two forms—oestradiol benzoate which was used parenterally, and alpha oestradiol which was given by mouth. Their conclusions are of interest:

Evidence is presented which suggests that leukoplakia buccalis and similar lesions are associated with alterations in the menstrual cycle in women and with a deficiency or disturbed metabolism of the sex hormones in both sexes. Treatment with oestrogen based on this evidence has resulted in the complete disappearance of the lesions in 42%, marked improvement in 39% and no improvement in the remaining 19% of 38 patients. In general, the women responded more satisfactorily to the treatment than did the men. Although further observation is needed, it is suggested that this type of therapy in combination with other well-recognized procedures may prove of value in the treatment of leukoplakia buccalis.

In view of the fact that leukoplakia buccalis is regarded as a precancerous lesion, the implications of this report are far-reaching.

Depth Bombs: see SUBMARINE WARFARE.

Dermatology. Most important in dermatology is the announcement of Saenz, Grau Triana, and Alphonso, on Aug. 3, 1938, that they have found the causative organism of pinta, thus disproving definitely, the theory of a fungous origin. The organism was a spirochaete, morphologically identical with that of syphilis. The discovery was made in Havana and was later confirmed by observations in Mexico. In the treatment of skin diseases, the use of sulphanilamide is significant. Nelson, Rinzler, and Kelsey compared results of treatment by this drug of 344 cases of erysipelas, with a series of 4,473 cases treated from 1930-36, by other methods. In the series treated by sulphanilamide, the mortality was 2.62% in the control group. Apparent cures have been obtained in several cases of actinomycosis, in England and America. Astonishing results have been noted in obstinate cases of chancroid. Kornblith, Jacoby, and Wishengrad treated 65 cases of chancroid without failures or recurrences. In every case, complete healing took place at the end of two weeks. Sulphanilamide has shown encouraging results in lymphogranuloma venereum with rectal involvement. Results of treatment of

lupus erythematosus of the fixed type, by sulphanilamide, have not been uniform. However, a spectacular cure was reported by Anderson of the acute disseminated type, the patient being moribund at the time of the treatment. Favourable results were also recorded by Weiner, Wollenberg and Ingels in cases of the disseminated type. The cutaneous ill-effects of sulphanilamide therapy which have been observed include purpura, scarlatiniform and morbilliform eruptions, erythema, urticaria and exfoliative dermatitis.

Good results have been obtained by Jacobson in coccidioid granuloma, by vaccine therapy. In 20-odd cases of systemic and cutaneous types, results compared favourably with all other methods, including injections of colloidal copper.

Dermatitis has become an important problem in industrial medicine. It is generally admitted that such cases are responsible for 40-60% of all claims for compensation in the United States. The activity of dermatologists in this branch of medicine is shown by excellent symposiums at the recent meetings of the American Dermatological Association and the American Medical Association. An excellent text-book on *Occupational Diseases of the Skin*, by Schwartz and Tulipan, has just appeared. It is the first book in English, on this subject, to have been published since that of Prosser White. According to Foerster and Schwartz, tar and pitch constitute important occupational hazards and often produce dermatitis and melanosis. These are due to photosensitization by ingredients of coal tar having different fluorescent spectrums from those which cause cancer.

Recent knowledge of vitamin deficiency in diseases of the skin has been reviewed by Goodman. In general, the results of treatment are unsatisfactory. A number of articles, however, report favourable therapeutic action of nicotinic acid in pellagra. A striking effect is shown in stomatitis and glossitis, mucous membranes becoming normal as a rule, after 24 hours, or at most, three or four days. The intestinal and psychic symptoms later disappear and the skin finally becomes normal. The use of vitamin B₁ in two cases of acrodynia was reported by Durand, Spickard and Burgess to have been followed by dramatic improvement within three days after the beginning of intramuscular injections. A few favourable reports on acne have been published. The reports on psoriasis show conflicting opinions. (See also VITAMINS.)

Attention has been called by Vieira and by Lindenberg to the comparative frequency, in certain parts of Brazil, of a disease whose clinical features are those of pemphigus foliaceus. Facts are mentioned which favour an infectious causation. From extensive animal experiments, Lindenberg claims that this form of pemphigus, and also psoriasis, and probably lupus erythematosus and alopecia areata are due to filtrable viruses, circulating in the blood. From his work, he claims to have established a new conception of disease, that of a chronic viraemia.

Destroyers: see NAVIES OF THE WORLD.

Deterding, Sir Henri Wilhelm August

(1866-1939), Dutch oil executive and director-general from 1902 to 1936 of the Royal Dutch Oil company, was born in Amsterdam on April 19. He left school at the age of 16 to join the staff of the Twentsche bank in Amsterdam, but after six years of drudgery as a clerk he decided to seek his fortune in the East Indies. In 1888 he was a bookkeeper at Belawan, in North Sumatra, for the Nederlandsche Handels Mij; the next year he was an agent for the trading company at Medan, and the year following at Penang. In May 1896 he joined the Royal Dutch Oil company, then a comparatively small organization which had been founded six years before. Deterding advanced rapidly and expanded the company until it had storage outlets in many important Asiatic ports. A year after he became director-general he formed the Asiatic Petroleum company, which immediately challenged Standard Oil company for control of the rich oil markets in the Far East. Deterding then extended his operations to Rumania, Russia, Egypt, South America and, in 1908, to the United States. The company he originally founded in Oklahoma became the Roxana company and later the Shell Union company. He retired in 1936 from active direction of his far-flung oil empire. Two years before he had published his autobiography, *An International Oilman*, a work which served to dispel the public notion of him as a legendary giant of international finance. Deterding, who was a Knight of the British Empire, died February 4 at St. Moritz, Switzerland.

Detroit, in Wayne county, in South-eastern Michigan, and on the Detroit river, the metropolis of the State, and the fourth city in the United States; area, 139.6 sq.mi.; population (U.S. census, 1930) 1,568,662; (estimate, 1939) 1,600,000. Foreign-born, 399,281. Canadian and British predominate, greatly exceeding in numbers the Polish group, which is second in importance. Assessed value, \$2,471,597,680; gross bonded debt, \$371,913,460 which includes \$99,718,739 of self supporting utility debt; gross city appropriation, \$133,909,438 including utilities; tax levy, \$67,637,742; tax rate for city purposes, \$27.37.

The economic, and to some extent, the governmental life of Detroit is largely determined by the production of automobiles. The first of the large cities to go into the depression in 1929, Detroit experienced an unusual economic recovery in 1937, due to the renewed buying of automobiles. This recovery was marked by a decided regression in the latter part of the year which was continued throughout 1938 and 1939. Full benefit of the national upturn in 1939 was negated by numerous strikes, the largest of which affected an estimated 80,000 wage earners employed by the Chrysler Corporation and its suppliers, and lasted for 54 calendar days. Settlement was finally effected through intervention of national C.I.O. officials. In this strike the new technique of the "slow down" was introduced, compelling the management to take the initiative in closing its plants and resulting in charges by the union that the cessation was a "lockout." However, unemployment compensation benefits were denied to the groups primarily affected and the distinction between a "strike" and a "slow down," if any, doubtless will be settled by the courts. During 1939 the industry produced about 3,725,000 cars as compared with 2,656,000 in 1938.

At the close of 1939 there were 19,000 families on relief and 30,000 WPA relief workers in Wayne county, Detroit representing more than four-fifths of the total.

One immediate result of the erratic economic situation in the city has been marked fluctuations in total population. There are indications that the total is now only slightly more than at the beginning of the decade. Assessed valuations are still at about the 1924 level, a reduction of one-third.

The heavy relief burden, decreased property values, a continuing current deficit of about \$15,000,000, and large tax budget necessary because of fixed charges complicate the problem of city government.

Much needed maintenance of capital improvements continues to be deferred and highly desirable improvements and services cannot be supplied. The financial difficulties of the city are further aggravated by gradually increasing debt charges which result from the refunding of the municipal debt. Detroit was the largest American city to default, the debt being refunded at a heavy cost in deferred interest.

The recognition of the United Automobile Workers by the automotive companies (except the Ford Motor Company) was followed by discord within the higher management of the union, trials of officers, purges, and finally an open break as to whether the union would affiliate with C.I.O. or A.F. of L. The C.I.O. faction appears to have definitely won, but for some time employers were uncertain as to which group should be dealt with.

As might be expected, the unions have been active in politics and in 1937 presented labour candidates for the offices of mayor and council. All new labour representatives were decisively defeated. In the election of Nov. 1939, the unions were content to support candidates who were not allegedly anti-labour, but charges of C.I.O. domination were used extensively in the campaign against the labour endorsed candidate. The candidate so endorsed was elected by a substantial majority, but there were no significant changes in the council. This victory has been given much publicity as a seizing of the administration of the city by radical labour. Such is by no means the case. The newly inducted mayor has repeatedly affirmed his independence of any faction and no labour leaders have been appointed to important positions.

During the year the administration of the city was affected by charges of corruption within the police department, under investigation by a grand jury, the placing of the police under a separate merit system by charter amendment, extension of civil service to all employees except those of the department of health, altercation with the State authorities concerning the distribution of State aid, and the creation of Detroit as a separate county for the purpose of relief administration. City-State relationships continued to present problems of under-representation of the populous Detroit area in the legislature, a situation that was made more tense by the increased reliance of the local governments upon State subsidies for education, highways, and relief, and questions as to the equity of the formulae employed in such distribution.

An interesting development in the centre of motor production has been the rapid introduction of buses by the municipally owned street railway. New lines are being served entirely by light, inexpensive buses, and after rush hours and on holidays these have been substituted for street cars on many of the rail lines. Under certain conditions the buses have proven cheaper to operate than street cars, but the resulting decreased use of electric power has complicated the operation of the municipally owned power plants.

The system is also experimenting with the operation of parking lots outside the business area, serving these with buses in an effort to relieve downtown congestion. (L. D. U.)

Devil's Island: see FRENCH GUIANA.

Dewey, Thomas Edmund (1902–), U.S. attorney and politician. He was born March 24 at Owosso, Mich., graduated from the University of Michigan in 1923, and received his law degree at Columbia in 1925. He was admitted to the bar of New York in 1926 and was engaged in private practice for the next five years, until his appointment in 1931 as chief assistant U.S. attorney for the southern district of New York. In 1934 he returned for a year to private practice, but also became a special assistant to the U.S. attorney general in the tax proceedings against Charles E. Mitchell. From 1935 to 1937 Dewey was a special prosecutor for the Investigation of Organized Crime in New York city, and in Nov. 1937 he was elected district attorney of New York county. Within the short space of a few months his successful prosecution of New York racketeers and political leaders had made him a figure of national prominence. His most famous trial was that of James J. Hines, Tammany "boss" for alleged protection of leaders in the "policy number" lotteries of New York city. A mistrial was declared Sept. 12, 1938, but Dewey brought Hines to trial again in Jan. 1939 and secured a conviction on February 25. In Nov. 1938, Dewey ran on the Republican ticket against Gov. Herbert H. Lehman for governor of New York but was defeated by the slight margin of 2,383,584 to 2,316,078 votes. Despite this defeat he is a prominent candidate for the Republican presidential nomination in 1940. He formally announced his candidacy Dec. 1, 1939, and inaugurated his campaign immediately.

Diabetes. New peaks of diabetic incidence are discernible. In the United States, where mortality statistics are most easily available, the State with the highest figures is Rhode Island where for 1937 and 1938 the death rates per 100,000 were 42 and 41.9 respectively. New York for 1937 stands next with 36.9 and Massachusetts for the same year with 33.7; the latter rate held in New Hampshire for 1938. Only once between 1933 and 1937 did any other State except those mentioned exceed 33.7 and that was Vermont in 1934 in which there was an exceptional value of 37.2. The lowest rates in 1937 were in New Mexico 8.1, Arkansas 9.2, Arizona 10, and Alabama 10.6 per 100,000. A concentrated effort to explain the high rates in Rhode Island, New York and Massachusetts is indicated.

Possibilities to be considered in explaining these very high and very low death rates are differences in sex, longevity, race, occupation, social status, individual income, or variations in statistical methods in evaluating death certificates. For the entire United States, the diabetic mortality in 1937 was the same as in 1936, namely, 23.7 per 100,000. In New York city in 1938, diabetes ranked eighth as a cause of death and for females alone, sixth.

The number of living diabetics undoubtedly is growing in all countries. The per cent of hospital admissions in Helsinki, Finland, according to Ponteva, whose monograph is rich in statistics, rose from 2.1% before the discovery of insulin to 10.8% in the midst of the depression in 1931, and this experience appears to prevail in the hospitals of all countries. The diabetic population is augmented also because the duration of the disease is lengthening and so much so that it is probably safe to say that the average diabetic acquiring the disease in 1940 irrespective of age at onset will live 20 years. In fact it is known that 12% of a group of 611 patients first seen in one clinic between 1898 and 1914 achieved that duration after onset of diabetes.

To the subject of heredity and diabetes, Rathery has made a valuable contribution and presented a sane discussion. Whereas in his hospital statistics only 16.9% of the patients showed heredity, in his private practice he found 49%. The statistics of most clinics show approximately 25% heredity, but Rathery believes the higher percentage disclosed among his private patients to be

nearer the true value. In general he concludes that heredity is greater in Jews and in children, in the milder than in the severer cases, but the evidence shows no definite conclusion as to predominance of maternal or paternal transmission. Rathery cites Rondelet, a physician of Montpellier at the opening of the 16th century, as the first to note the influence of heredity in diabetes.

The well-being of the diabetic taking protamine zinc insulin represents what is best so far in the treatment of diabetics. It can be measured concretely (1) by the disappearance of hepatomegaly already existing or the lack of appearance of an enlarged liver in new patients; (2) by the fall in deaths due to coma from 64% in a large group of patients prior to 1914 to 3.6% during the year 1937; (3) by the change in appearance, disposition, and character of all the patients, particularly the children.

The working capacity of the modern diabetic has been investigated in England, Finland, and in two of the larger clinics of the United States. The studies show that diabetics today not only can, but do, in large degree maintain themselves. Fully two-thirds work like normal individuals and another sixth do nearly full time work.

The first monograph wholly devoted to studies of trauma in carbohydrate metabolism and diabetes, appeared in 1938 by Viggo Thomsen of Aarhus, Denmark; it is printed in English. Thomsen's detailed clinical investigation of hospital patients admitted with trauma, his experimental studies and his review of the literature, afforded him no evidence to support the contention that trauma caused the disease. In Aug. 1938 a new type of insulin was released for general sale under the name of "insulin specially prepared as a solution of zinc insulin crystals." Like "regular" insulin, this crystalline preparation (containing 0.2-0.4 mg. of zinc per 1,000 units) is clear, acid, and has a quick, relatively shortlived action. It seems to act longer than the regular insulin, though the difference is so slight as to be of minor importance clinically. Crystalline insulin may be used in any situation in which regular insulin has been employed. In addition to the three preparations of insulin now generally accepted and used ("regular," crystalline, and protamine zinc), there are several other types which have been proposed. Among these are hexamine insulin, histone insulin, and globin insulin. Further studies will be necessary to determine the place of these newer preparations in treatment. So far implants of insulin preparations subcutaneously have not been successful.

Although the number of cases of tuberculosis in diabetic patients does not show the reduction which might be expected from the falling rate of tuberculosis in the community as a whole, nevertheless, the number of cases of tuberculosis developing in diabetic patients in proportion to the long duration of their diabetes has definitely decreased since the use of insulin. The great susceptibility to tuberculosis shown particularly in those patients in whom control of the diabetes has been least perfect, notably the cases who have had diabetic coma and also in diabetic children, will remain. However, among a series of 396 cases of diabetics with tuberculosis encountered at one hospital, it is conspicuous that since 1936 no cases have been discovered before the 20th year of age of the patient.

The effects of a disturbance of an endocrine gland are not always localized in that one gland, but are also found in others. This is strikingly illustrated in many diabetic pregnancies. During pregnancy the ovaries, thyroid, and pituitary have altered structure or function and the placenta also assumes the role of an endocrine gland. It secretes the hormones ordinarily formed in the ovary, estrin and progesterin, and a pituitary-like hormone, choriogonadotropin (prolan). In diabetes the normal balance of these placental hormones is often altered. This disturbance of hormonal balance appears to be associated with the accidents of

pregnancy, abortion, miscarriage, premature delivery, toxæmia, still-birth, and neonatal death. It has now been demonstrated that it can be corrected by substitutional therapy. In a small series of patients so treated foetal mortality approached the low incidence of normal mothers. (See also GYNAECOLOGY AND OBSTETRICS.)

Hunt, "Prediction and Prevention of Late Pregnancy Accidents in Diabetes," *Am. Jour. Med. Sciences*, 198:482 (1939). (E. P. Jo.)

Diamonds. World output of diamonds in 1938 made another new high record of 11,600,000 carats, and an increase of 21% over 1937, almost all of which came from the Belgian Congo, where production was raised by nearly one-half; the only other material increase was in South Africa; Gold Coast and Sierra Leone both declined. In bulk, the Congo output reached 62% of the total, but because of the high percentage of industrial stones, the proportion by value was reduced to probably little more than half this figure. The British Empire produced better than 30% of the total by weight, and nearly 70% by value.

In addition to the producers shown in the production graph, only Brazil and British Guiana had outputs of material size. Producers of minor importance include French Equatorial Africa, French West Africa, Southern Rhodesia, Tanganyika, Borneo, India, and New South Wales.

In 1939, only one mine was in active operation in South Africa, though washing of blue ground stocks was being carried on at two others, with recoveries during the first half of the year 10% above the average rate for 1937, while alluvial recoveries showed an average decline of 27%. Gold Coast during the first half of 1939 was about 20% behind the same period of 1937. No other specific operating data have yet become available.

The Diamond Corporation, the central selling agency that handles the sales for all important producers, reported sales in 1938 valued at about £4,000,000, as compared with £10,000,000 in 1937, a peak value of £12,000,000 in pre-depression years, and a depression minimum of £1,500,000 in 1932.

In 1938, the United States imported 1,818,700 carats of diamonds, valued at \$28,307,000; on a weight basis this is 15.7% of the world output for the year, but on a value basis, the percentage would be much higher. This total included 91,500 carats of rough

DIAMOND PRODUCTION OF THE WORLD and the major producing countries (The Mineral Industry)

stones, 330,900 carats of cut stones, and 1,396,200 carats of industrial stones; although the percentage distribution of these by weight was 5.0 for rough, 18.2 for cut, and 76.8 for industrial stones, the corresponding percentages by value were 25.0%, 60.1%, and 14.9%. The increased demand for diamonds in industry has been phenomenal, expanding more than forty fold since 1929; incidentally, the rapidly rising sales of stones of this class has been an important item in helping producers to weather the depression, which bore heavily on the industry. (G. A. Ro.)

Diatomite. The accumulated siliceous remains of multitudinous numbers of microscopic organisms known as diatoms have found so many industrial uses that the product is now mined in large tonnages, and goes to the market as the mineral formerly called kieselguhr, but now usually known in English-speaking countries as diatomite.

Its chief uses are as a heat insulator, a filter-aid in many types of chemical industry, a filler in paints, varnishes, enamels, and rubber, an abrasive, as an admixture in concrete, and as a carrier for insect poisons. Roughly, production is of the order of 100,000 tons annually in the United States, 80,000 tons in Denmark, 50,000 tons in Germany, 12,000 tons in Algeria, and smaller amounts in a number of other countries. (G. A. Ro.)

Dietetics. If not as spectacular as the discovery in 1938 of the deficiency of nicotinic acid in pellagra the recent evidence of human requirements for riboflavin and vitamin B₆ may be as significant. That a pellagra problem still exists is indicated by recent reports. Pellagra symptoms may be cured by nicotinic acid but, if poor diets are continued, other dietary deficiencies become apparent. Neuritis cured by vitamin B₁ may be the first, then riboflavin deficiency characterized by skin lesions particularly about the mouth and nose. A number of patients whose diets remain poor while they receive these synthetic vitamin supplements are still nervous and weak. They are relieved dramatically by synthetic vitamin B₆.

Adaptation of the eye to dark was used extensively in 1939 to determine minimum requirements for vitamin A as well as to indicate its deficiencies in pregnant and nursing women, in patients with cirrhosis of the liver and thyroid disease. Twenty-five per cent of night-blind Africans had Bitot's spots which vitamin A healed. Similar spots were found in the eyes of children in Ceylon along with toad skin. Mellanby's production of deafness in young animals on vitamin A deficient diets through overgrowth of cranial bone may have significant human implications.

Much of the current research on vitamin B₁ is devoted to chemical methods for its determination. Vitamin B₁ treatment continues for a wide range of toxic and neuritic conditions, as peripheral neuritis, herpes zoster, delirium tremens, insomnia and the early cardiopathies of alcohol addicts. It is used successfully in the pre-operative treatment of hyperthyroid patients. Suggestions of metabolic interdependence between manganese and vitamin B₁ and observations of zinc deficiency in beri-beri patients open new fields for speculation and research.

Widespread mild deficiencies of vitamin C are reported, but the optimum human intake is not agreed upon. Saturation levels

are reported by Belser as from 70 to over 100mg. daily. Kellie is "saturated" between 30 and 40mg. per day. For pregnant women the intake should not fall below 75mg. and for lactation 100mg. daily. Increased use of vitamin C has also been noted in diseases which are accompanied by increased oxidation or proliferation as malignant tumour, hyperthyroidism and leukaemia.

Food sources of vitamin K are the green parts of plants and some vegetable oils. Bile must be present for its absorption and the liver adequate to form prothrombin. Interference with any part of this process may so increase blood clotting time as to permit haemorrhage.

Two forms of vitamin K, K₁ from plants and K₂ formed by bacterial action, have been identified. Both forms of the vitamin have been prepared and most details of their structure as derivatives of 1,4-naphthoquinone agreed upon.

From calcium and phosphorus balance studies the requirements of older adults appear to be much the same as those of younger, reduced intakes are not offset by reduced requirements and they are able to restore calcium and phosphorus to the body after depletion. This is significant in view of senile osteoporosis due to long-continued deficiency of calcium and vitamin D. That the rachitic tendency of cereals may be counteracted by adding calcium lactate to the diet is further evidence of favourable supplementary relations between cereals and milk.

Duckworth's summary on magnesium in nutrition calls attention to its roles in metabolism. The importance of magnesium in human nutrition should receive consideration since deficiencies may occur more frequently than has previously been suspected.

Recent evidence of fluorosis comes from England, Denmark, India, North Africa, as well as the United States. In three regions after eight to ten years' change in the water supply the production of mottled tooth enamel has been halted. Of interest also is the unexplained coincidence of lower incidence of carious teeth where drinking water contains fluorine.

Widdowson finds that administering iron in therapeutic doses converts the usual fall of haemoglobin in pregnancy to a rise, which, if the iron be discontinued, falls again at the previous rate. She does not conclude which level is the optimum state. Bethell recognizes haemoglobin below 10mg. per cent as undesirable in the pregnant woman and prescribes iron in addition to at least 50 grams of animal protein and other protective foods to prevent the macrocytic anaemia which he observed.

Almost 200 dietary studies were reported in 1939, practically twice as many as in 1938. A large proportion of these are sponsored or inspired by the Nutrition Committee of the League of Nations. (See also VITAMINS.)

Disasters. The following list includes outstanding accidents and disasters of 1939. Disasters that resulted from purely military or naval action will be found by date in the CALENDAR OF EVENTS, p. 1 ff. A list of the merchant ships sunk by submarines, mines, and surface craft during the year is included in the article SUBMARINE WARFARE. Warships sunk by naval action during the year are also listed chronologically by date of sinking in the CALENDAR OF EVENTS.

Aviation

- Jan. 7 Near Senlis, France. Zurich-Paris passenger plane crash killed 3, injured 6.
- Jan. 13 Near Miles City, Mont. Crash of airliner killed 4.
- Jan. 14 Near Rio Bonito, Brazil. Passenger plane hit side of mountain; 10 killed.
- Jan. 18 Near Darwin, Australia. Mail-plane crash killed 4.
- Jan. 21 British flying boat "Cavalier" forced down and sank in Atlantic enroute from New York to Bermuda; 2 passengers and steward drowned; 10 survivors were rescued after 10 hours in sea by tanker "Esso Baytown."
- Jan. 23 Near Los Angeles, Calif. Experimental light bomber of U. S. Army crashed, killing test pilot and injuring representative of French Air Ministry, whose presence in plane precipitated inquiry into charges that Gov't had revealed aviation secrets to foreign power.
- Feb. 20 Near Pensacola, Fla. Eight U. S. Navy training planes crashed in heavy fog; two pilots, including Brazilian Navy officer, were killed; six others leaped to safety in parachutes.
- Feb. 24 Near Nice, France. German plane with 12 Nazi army officers aboard crashed in Alps; all were killed.
- Mar. 18 Near Alder, Wash. Experimental stratosphere transport liner broke apart during test flight; 10 killed, including two members of Dutch aviation mission.
- Mar. 26 Oklahoma City, Okla. Eight killed, 4 injured when airliner crashed and burned.
- April 4 East Braintree, Mass. Four U. S. Navy fliers killed in collision of two planes during launching ceremonies of aircraft carrier.
- May 8 Guayaquil, Ecuador. Crash of military plane in crowded street set fire to surrounding buildings; at least 25 killed, including pilot.
- July 15 Atlantic ocean, 150 miles south-east of New York city. Coast guard plane bringing sick seaman to shore crashed; two pilots and patient killed.
- Aug. 11 Langley Field, Va. U. S. Army bomber crashed and burned; entire crew of 9 killed.
- Aug. 13 Rio de Janeiro, Brazil. Fourteen killed, including Prof. James Harvey Rogers, when "baby clipper" plane plunged into harbour and struck dry dock.
- Sept. 7 Near San Diego, Calif. Navy bomber with crew of 6 struck antenna of radio station; all killed.
- Oct. 19 Near San Diego, Calif. Four U. S. Navy fliers killed in mid-air collision of two dive bombers.
- Dec. 24 Mogador, Morocco. Italian plane inaugurating Rio de Janeiro-Rome air route crashed; 7 killed.
- Jan. 21 Jauchito, Colombia. Explosion in power storehouse killed 10 outright, injured many others.
- Feb. 3 Syracuse, N. Y. Collapse of wall in burning building killed 8 firemen.
- Feb. 5 Springfield, N. J. Four sleeping children burned to death in home.
- Mar. 1 Hirakata, Japan. Approximately 200 killed, 200 injured in explosion of army arsenal.
- Mar. 2 Halifax, Nova Scotia. More than 30 died in hotel fire.
- Mar. 28 Herstal, Belgium. Explosion in munitions factory killed 8 outright, wounded 40 others.
- April 12 Chicago, Ill. Seven Negroes burned to death in apartment building fire, allegedly set by discharged janitor; two others died later.
- April 19 Le Havre, France. S.S. "Paris" of French line burned and sank; 2 killed.
- April 22 Ottumwa, Ia. Father and five children died in fire.
- May 9 Near Tokyo, Japan. Eight factories destroyed by series of explosions; at least 11 killed, 260 injured; 30 missing.
- May 11 Chicago, Ill. Dust explosion and fire destroyed five grain elevators; 9 dead, 23 injured.
- May 31 Barberton, Ohio. Gas explosion in school house injured 40 children, 4 adults.
- July 10 Peñaranda de Bracamonte, Spain. Approximately 100 killed, 1,500 injured in explosion of munitions factory; town was virtually demolished.
- July 14 Providence, Ky. Twenty-eight coal miners died in explosion.
- July 29 Santa Rosa mountains, Nevada. Four members of Civilian Conservation Corps trapped by forest fire and killed; another missing.
- Aug. 13 Ft. Knox, Ky. Six National Guardsmen killed by explosion of shell they believed to be "dud."
- Sept. 12 (?) Off Casablanca, French Morocco. French warship "Pluton" exploded; at least 100 killed.
- Oct. 27 Dunfermline, Scotland. At least 35 miners killed in colliery explosion.
- Oct. 29 Rock Springs, Wyo. Five schoolboys killed by blast caused by rifle bullet.
- Nov. 13 Lagunillas, Venezuela. Town destroyed by oil fire; approximately 200 dead or missing.
- Dec. 13 Near Brachto, Rumania. Explosion in cellulose factory killed more than 60.

Marine

- Feb. 2 Bungo strait, Japan. Japanese submarine "I-63," with crew of 87 aboard, sank after collision, 6 were rescued.
- Feb. 8 Atlantic ocean, 1,500 miles east of New York. British freighter "Maria de Larrinaga" sank with 37 aboard.
- May 23 Off Hampton Beach, N. H. U.S. submarine "Squalus" sank in Atlantic with 59 men aboard; 33, including Lieut. O. F. Naquin, the commander, were rescued May 24 and 25, and brought to surface in rescue bell; 26 were trapped and drowned.
- June 1 Liverpool bay. British submarine "Thetis" sank with 103 men aboard; 4 escaped through hatch; rescue attempts failed after protruding stern of submarine sank to bottom before it could be cut open or held fast

Fires and Explosions

Jan. 9-14 Australia. At least 31 killed in brush fires throughout Victoria.

A FLEETING HOPE FOR 99 MEN trapped in the sunken British submarine "Thetis" spurred rescuers June 1, 1939, while the stern projected 18ft. above the surface of Liverpool bay, but a strong tide swept the craft to the bottom

WRECKAGE of the streamliner "City of San Francisco," in which 24 persons were killed near Elko, Nev., Aug. 12, 1939

- at surface; toll of 99 dead was greatest of any submarine disaster.
- June 15 Cam-Ranh bay, French Indo-China. French submarine "Phenix" disappeared after dive, with 71 aboard. No trace of craft, except oil slick on surface, was found.
- July 18 Pacific ocean, 1,100 miles east of Yokohama. Japanese ship "Bokuyo Maru" exploded and sank; 3 died; 209 rescued.
- July 22 St. Lawrence river, near Deschailions, Que. Schooner cut in half by freighter; 4 missing.
- Aug. 23 Off Ilhéos, Bahia, Brazil. Coastwise steamer "Itacaré" foundered near port; at least 30 drowned.
- Dec. 12 La Perouse (Soya) strait, Japan. Soviet steamer "Indigirka" wrecked in storm; 700 believed killed; approximately 400 rescued.
- Dec. 12 (?) North sea (?) British destroyer "Duchess" sank after collision with another warship; more than 100 believed drowned.
- Dec. 25 (?) Black Sea. Turkish ship "Kilzilmak" sank in storm with entire crew of 20; Greek steamer "Astrea" lost with crew of 14 aboard.

Motor Traffic

- Mar. 29 Near Jackson, Miss. Fourteen died when 11 motor cars plunged into swollen creek through gap in highway caused by washout of bridge. (See also TRAFFIC ACCIDENTS.)

Miscellaneous

- July 22 Mount Baker, Wash. Snowslide engulfed college party of mountain climbers; three men and three girls killed.
- Aug. 5 Near Somerset, Pa. Giant boulder killed four workers in highway tunnel.
- Oct. 23 Perth Amboy, N.J. Five babies killed by escaping steam in hospital.

- Nov. 10 Near Morioka, Japan. More than 200 trapped in sulphur mine; 34 known dead; 60 missing.
- Nov. 17 Near Beaufort, N. C. At least ten drowned in collision between tug-boat and fishing vessel on inland waterway.

Natural Disasters

- Jan. 24 South Central Chile. Earthquake devastated area of approximately 50,000 square miles. Estimated death toll was 30,000, mostly in Concepcion and Chillan. Razed cities were evacuated by survivors.
- Feb. 2-5 Ohio river valley. Five dead in floods; approximately 11,000 homeless.
- Mar. 25 Dawson Creek, B.C., Canada. Eight persons drowned in flood.
- Mar. 25 Near Bareges, France. Avalanches in Pyrenees killed 28; others missing.
- Apr. 15-16 Texas, Louisiana, Arkansas, Oklahoma. Tornadoes killed at least 40.
- June 18 Anoka, Minn. and vicinity. Tornado killed 10, injured 63.
- July 5 North-eastern Kentucky, U.S.A. At least 75 drowned, others missing in "flash" floods from swollen mountain streams.
- August Northern China. Vast areas under flood waters; approximately 10,000 persons homeless, starved, or drowned.
- Sept. 22 Vicinity of Smyrna, Turkey. At least 300 killed in earthquake.
- Sept. 24 Southern California coast. At least 18 killed, 57 missing in tropical storm.
- Dec. 27 Northern Turkey. Earthquakes devastated wide regions in Eastern and Northern Anatolia; casualties estimated at more than 100,000 killed or injured; city of Erzingan completely destroyed, with more than 15,000 deaths; floods later increased toll of dead.

Railroads

- Feb. 11 Near Barcelona. Runaway express crashed into local train; 35 killed, more than 100 injured.

- Feb. 19 Near Tennant, Ia. Runaway locomotive collided head-on with passenger train; 2 killed; 23 injured.
- Feb. 24 Near San Luis Potosi, Mex. Train wreck killed 6.
- Feb. 28 Boston, Mass. Trolley car jumped tracks; 6 killed, 25 injured.
- Mar. 30 New York city. More than 200 injured in collision of subway trains.
- April 13 Near Queretaro, Mex. Train wreck killed 28 outright; others died later; more than 50 seriously injured.
- May 25 Near Newington, Conn. Cab of work car sideswiped Montreal-Washington express; 1 killed, more than 20 injured.
- Aug. 12 Near Elko, Nev. Streamliner "City of San Francisco" wrecked after passing over rail that had been bent in and spiked down; 24 killed, 113 injured.
- Sept. 4 Chicago. Six persons standing on track killed by suburban train.
- Sept. 11 Near Warroad, Minn. Three killed, 5 injured in head-on collision of two Canadian National trains.
- Aug. 12 Denver, Colo. Collision of two passenger trains killed one, injured more than 50.
- Oct. 8 Berlin, Germany. Twenty-two killed in collision of trains.
- Nov. 13 Near Oppeln, Germany. Train wreck killed 43, injured 60.
- Dec. 12 Near Hagen, Germany. At least 17 dead in train collision.
- Dec. 22 Near Magdeburg, Germany. At least 132 killed, 109 injured, in collision of two express trains; 99 killed, 40 injured in another wreck near Friedrichshafen.
- Dec. 30 Near Naples, Italy. Frozen switch caused train wreck in which at least 29 were killed, 100 injured.

Disciples of Christ, a religious body having its chief strength in the United States and Canada, which received its initial impulse in 1809, dates its separate existence from 1830, and its nationally organized work from 1849. It is also well represented in Great Britain, Australia and many mission fields. Local churches are generally known as Christian Churches or as Churches of Christ. The headquarters of its United Christian Missionary Society and other promotional and educational agencies are at Indianapolis, Ind. Its National Benevolent Association has headquarters at St. Louis. Its International convention (United States and Canada) is held annually (Richmond, 1939, Roger T. Nooe, president; H. B. McCormick, president for 1940). The quadrennial world convention, set for Toronto, Aug. 6-12, 1940, was postponed on account of the war. Disciples of Christ are participating in the arrangements looking toward the organization of the World Council of Churches. F. H. Groom was visiting American delegate to the convention of British Churches of Christ. Stephen J. Corey, former president of the United Christian Missionary Society, became president of the

THE CITY OF CONCEPCION was almost totally destroyed by the Chilean earthquake of Jan. 24, 1939, which took an estimated total of 30,000 lives

College of the Bible, Lexington, Kentucky. D. S. Robinson succeeded J. W. Putnam as president of Butler university, Indianapolis, Ind. World membership is 1,818,163, a gain of 28,872 for the year. In the United States and Canada there are 1,657,426 members (gain 27,033), 8,071 churches (loss 39), 7,466 ministers (gain 159). For the year ending June 30, 1939, total receipts of national and State agencies reporting to the International convention were \$4,110,241. Receipts for local church maintenance were \$10,875,048. There are many independent missionary agencies not reporting. (W. E. GA.)

Divorce: see MARRIAGE AND DIVORCE.

Dmowski, Roman (1864-1939), Polish statesman and patriot, was born in Warsaw. He studied for the law but soon gave it up to work for the cause of Polish independence. Part of his work was in the open, as leader of the Polish party in the Russian Duma. Most of it was secret. Several times he was jailed by the Russian police, and he travelled extensively in Europe, Asia, and the United States to hold conventions of Polish separatists. He founded the Polish National Democratic party in 1893. During the World War he became president of the Polish National committee in Paris. With Ignace Paderewski he was delegate to the Versailles conference in 1919 and signed the treaty for the new Polish Republic. From 1919 to 1922 he was a member of the Polish diet and in 1923 he was appointed minister of foreign affairs. He retired from active politics in 1924 and died at Warsaw on January 2. See *Encyclopædia Britannica*, vol. 18, p. 148 fol. for the role of Dmowski and others in the struggle for Polish independence.

A RESCUE BELL brought 33 survivors to the surface from the sunken U. S. submarine "Squalus" off Hampton Beach, N. H., May 24 and 25, 1939. Twenty-six men were lost

Doherty, Henry Latham (1870-1939), U.S. public utilities and petroleum executive, was born May 15 at Columbus, Ohio, where he was educated in public schools and began his career as a newsboy and as office boy in a public utility company. Between 1890 and 1905 he was an executive of public utilities in St. Paul, Denver, San Antonio, and 26 other cities; then he organized his own company to finance and operate various utilities. In 1910 he organized Cities Service Company, a gigantic holding company which at the time of his death controlled almost 200 petroleum and utility corporations and had assets of more than \$1,000,000,000. Doherty also had extensive real estate holdings in New York city, Florida and elsewhere. Especially in his later years he was actively identified with several philanthropic enterprises. He died December 26 at Philadelphia.

Dolan, Francis James (1893-1939), American educator and clergyman, was born at Boston, Mass. on July 14. He received his education at Boston college, at St. Andrew-on-Hudson, a Jesuit novitiate, and at Woodstock college, Woodstock, Md. He was professor of classics at Loyola college, Baltimore, from 1919 to 1921 and at Holy Cross college, Worcester, Mass., from 1921 to 1923. He was ordained to the priesthood of the Roman Catholic church June 14, 1926. The next year he was appointed dean of freshmen and professor of natural theology at Boston college and, after two years of graduate study in England, he became dean of Holy Cross college in 1931. On July 15, 1933 he was selected as president of Holy Cross and remained in this position until his death September 6, at Worcester, Mass.

Dolci, Angelo Maria (1867-1939), Italian ecclesiastic, was born July 12 at Civitella d'Agliano. He graduated from the Pontifical Academy for Noble Ecclesiastics and was ordained priest in 1890. In 1900 Pope Leo XIII appointed him bishop of Gubbio, and six years later he was named apostolic delegate to Bolivia, Peru and Ecuador. In 1911 he returned to Italy, was named bishop of Amalfi, and sent to Rumania to negotiate a concordat with that country. After the World War he was apostolic delegate to Turkey, during which time he conducted extensive relief work among the Armenians. He then returned again to Rome, where he engaged in administrative work at Vatican city and was created cardinal March 13, 1933. He died in his native town on September 14.

Dominica: *see* WEST INDIES, BRITISH.

Dominican Republic, a West Indian republic occupying the eastern two-thirds of the island of Hispaniola; language, Spanish; capital, Ciudad Trujillo; president, Dr. Jacinto B. Peynado. The area is 19,326 square miles. The population by the 1935 census was 1,479,417, and was unofficially estimated at 1,685,000 in 1939; it is predominantly mulatto and Negro, but whites are politically important. The chief cities are: Ciudad Trujillo (formerly Santo Domingo), the oldest European-founded city in the Western Hemisphere, pop. 71,296, and Santiago de los Caballeros, pop. 33,919.

History.—In January 1939, international attention was attracted by proposals made for the colonization of up to 100,000 Jewish and other refugees from Central Europe in the Dominican Republic, and, in March, a commission appointed by the Inter-governmental Committee on Refugees began a study of the feasibility of such large-scale colonization. Outbreak of war in Europe,

however, prevented any immediate action.

Education.—In 1937, there were 900 public and private primary schools, with an enrolment of 113,530 pupils.

Finances.—The monetary unit is the peso, equivalent to the U.S. dollar. Fiscal control is in the hands of a financial adviser and general receiver of customs nominated by the President of the United States.

Trade and Communication.—The Dominican Republic has good external communication by sea and by air. There are 268km. of government-owned railway and a highway network of over 1,500 kilometres. An additional 982km. of railroad is in use on sugar estates.

In 1938 imports totalled \$11,342,000 in value (principally textiles, machinery and structural materials), a decline of 3% from 1937.

The United States (54%), Japan (11%), Germany (8%), British West Indies (5%), and Great Britain (4%) were the principal sources of imports. Exports declined 9.8% over 1937, and totalled \$14,347,000, going chiefly to Great Britain (42%, against 31% in 1937), the United States (32%), and France (8%, against 14% in 1937), Germany (3%), and the Netherlands West Indies (3%). Exports for the first seven months of 1939 were valued at \$14,745,769, a 28.8% increase over the corresponding period of 1938. The Dominican Republic is primarily agricultural in its production, with sugar the most important crop, and cacao, in which it ranks fourth in the world production, second. These commodities, with coffee, hides, tobacco and lignum vitae, comprise the bulk of the exports. In 1939, cacao and coffee plantations were seriously affected by prolonged drought, and production was estimated to be 20% and 50%, respectively, of normal. (*See also* HAITI; WEST INDIES.) (L. W. BE.)

Donations and Bequests. The number of newly established foundations, endowments and trust funds organized for the benefit of the public continued to grow during 1939. Complete information is nowhere available as to the total chartered, but they run above 300 (Jan. 1, 1940). Upwards of 50 of these appear to be foundations in the sense in which the term was originally used, and thus having substantial endowments. About 33 have principal funds of \$4,000,000 or over.

The latest available study of these institutions reports the total capital of 243 of them as over \$1,200,000,000. Of this amount over 79%, or \$945,000,000 was held by 121 foundations; and the remainder by 122, whose total capital amounted to about \$250,000,000.

Some four additional foundations have reported assets of approximately \$70,000,000, but are not included here because the organizations' complete assets had not yet been made public.

Although at least three of the larger foundations have recently begun to make disbursements from capital, the total capital of foundations has increased during 1939 because of the considerable number of newly established institutions and of new additions to their principal funds. Among the more important additions were: \$5,000,000 to the Murry and Leonie Guggenheim Foundation, designated especially for dentistry and oral hygiene work for children in New York; \$10,000,000 to the Duke Endowment; \$600,000 to the National Foundation for Infantile Paralysis; and a substantial sum given to the Josiah Macy, Jr., Foundation by the original donor, Mrs. Walter G. Ladd.

The Rockefeller Foundation and the Carnegie Corporation continue to hold first and second place in respect to capital, the assets of the former amounting to about 20% of the total capital funds reported by all the foundations, and the assets of the latter to about 17%.

The next four largest, each reporting capital of more than \$46,000,000 and in order of size are: General Education Board, Commonwealth Fund, Kresge Foundation, and W. W. Kellogg Foundation. These six account for over 58% of the total foundation capital recorded in the latest available report.

Announcements of new foundations include the J. W. Van Dyke Scholarship Foundation, with \$1,500,000 to aid in the education of deserving students; the Dazien Foundation for Medical Research, with a bequest of \$1,325,000 for the support of postgraduate research in medicine; and a number of smaller organizations with capital funds and purposes not yet publicly stated.

The President of the Carnegie Corporation has learned of gifts to public libraries of more than \$4,000,000 during 1939, to art museums of more than \$1,000,000; and one bequest for hospital purposes in Texas of \$4,000,000. Large gifts to universities include some \$8,000,000 to the University of Chicago; more than \$8,000,000 to Northwestern university; \$4,500,000 to Yale; over \$4,000,000 to Harvard; approximately \$1,500,000 to the University of California; and \$8,000,000 from the H. W. Putnam Estate now subject to life interests, eventually to be divided among Harvard, Princeton, and Yale.

Among other universities receiving gifts of \$1,000,000 or more were: Emory university, Johns Hopkins Medical school and hospital, and the University of Texas.

A few increments to the number of community trusts, these being endowments held and managed by trust companies with disbursements of income directed by a committee partly made up of public officials, were noted in 1939. A recent report states that over 75 community trusts were in existence in 1938, the last year in which figures are available, with a total endowment of over \$48,000,000 and funds distributed running above \$1,707,000. One of the largest of these is the New York Community Trust, which reported the valuation of its capital funds in early 1939 at upwards of \$8,630,000.

Disbursements since 1933 had averaged something over \$200,000 per year. (See also CARNEGIE TRUSTS; COMMONWEALTH FUND, THE; FALK FOUNDATION, THE MAURICE AND LAURA; ROCKEFELLER FOUNDATION; ROSENWALD FUND, THE JULIUS; RUSSELL SAGE FOUNDATION.)

BIBLIOGRAPHY.—Two publications issued recently giving information on foundations, in addition to annual reports by practically all of them, are: Russell Sage Foundation Library, *American Foundations for Social Welfare* (revised ed.), a directory; Raymond Rich Associates, *American Foundations and Their Fields*, IV. (S. M. HA.)

Donnelly, Charles (1869–1939), American railroad executive, was born at Wisconsin Rapids, Wis., November 9. He received his degree of bachelor of laws at Georgetown university, Washington, D.C. in 1896 and began legal practice in Washington the same year. In 1903 he joined the Northern Pacific Railway company and became successively a divisional counsel, assistant general counsel, general solicitor, executive vice-president, and president from Dec. 1, 1920 until his death on September 4 at St. Paul, Minn.

Douglas, William Orville (1898–), American jurist, was born at Maine, Minn., on October 16, the son of a Scotch Presbyterian minister. He graduated from Whitman college at Walla Walla, Wash., in 1920, and after teaching for two years in the high school at Yakima, Wash., he enrolled at Columbia university, where he was granted his law degree in 1925. He was admitted to the bar in 1926 and from 1925 to 1927 lectured in law at Columbia and was associated with a legal firm in New York city. In the latter year he went to Yale, where he was successively assistant, associate, and full professor, then Sterling professor of law. During Herbert Hoover's adminis-

tration, Douglas assisted the U.S. Department of Commerce for three years in analyzing bankruptcies. He was called to Washington again in 1934 to direct the Securities and Exchange Commission's investigations into bondholders' committees and reorganizations—in both of which subjects he was a recognized expert. When he became chairman of the SEC in Sept. 1937 he requested the New York Stock Exchange to undertake self-reform within six months or submit to closer governmental supervision. The Exchange chose the former course and relations between the energetic chairman and Wall street became more amicable. On March 20, 1939, President Roosevelt nominated Douglas as associate justice of the U.S. Supreme Court, to succeed Justice Louis D. Brandeis, who had resigned February 13. Douglas, who is the youngest man in more than a century to occupy the bench of the highest court, is co-author of two books on cases and materials on business units, also *Corporate Reorganization* (1931), *Losses, Liabilities and Assets* (1932) and, with C. E. Clark, *Case Book—Partnership* (1931).

Drought. Those portions of the continents where drought expectancy is high—regions covering vast areas between the humid and arid climatic zones—produce an important part of the basic foodstuffs of the world, particularly grains and livestock. Large agricultural areas in these semi-humid and variable climates are found notably in the United States and Canada, Russia, Australia, India, Argentina and China. Serious rainfall deficiencies in these important grain and livestock regions have effects on the world markets for these commodities.

During 1939 droughts of some consequence occurred in several of these places at critical seasons. The year opened with a continuation in Australia of the exceptionally dry spring and record heat of summer which had prevailed in the latter part of 1938. In New South Wales, Victoria and part of South Australia it was expected that the wheat yield would be the lowest since 1914; there was an alarming loss of livestock and the supply of irrigation water for fruits was almost exhausted. Abundant rains toward the end of February ended the drought in most sections.

In the western winter wheat belt of the United States, especially in Kansas and Nebraska, the fall of 1939 was the driest on record. The winter wheat, which is planted early in the fall and is expected to germinate and start its growth before winter, had its development seriously retarded or completely failed to germinate in the dust of the prairie. Severe crop losses in the entire winter wheat belt except east of eastern Kansas and eastern Oklahoma were in prospect as the year ended. For the three months September, October and November, the lowest rainfall of record occurred in Nebraska, Kansas, Iowa, Illinois, Tennessee and Wisconsin. From the Rocky mountains eastward to Arkansas, Missouri and the upper Mississippi river and from northern Texas to southern Canada the precipitation for these three months was less than 50% of the normal. An area of similar deficiency extended in a narrow belt from Wisconsin through Illinois, southern Indiana, Kentucky and Tennessee to the Gulf of Mexico. The wheat region of eastern Washington experienced an equally severe drought.

During 1939 a serious summer drought occurred in western India, especially in the Punjab where the third successive year of moisture deficiency was experienced. More than 150,000 head of cattle were said to have died because of fodder shortage before late summer and fall rains brought relief.

In Argentina, drought was experienced during the growing season of 1938–39, most severe in the southern sections where the

crop of maize and wheat was in some places hardly worth harvesting.

Other, less widespread droughts were experienced during 1939 in the Shantung Province of China in the spring and in New York State in the latter part of the summer, particularly in the "southern tier" of counties where crops did not mature properly, and in the Piedmont region of Virginia, the Carolinas, and Georgia during the late summer and fall. (See also AGRICULTURE; DRY FARMING; DUST STORMS; IRRIGATION.) (H. R. B.)

Drugs and Drug Traffic.

Under the immediately effective provisions of the Federal Food, Drug, and Cosmetic Act of 1938, a total of 266 court actions were instituted during the fiscal year 1939 by the Food and Drug Administration because of the shipment in interstate commerce of dangerous drugs, dangerous therapeutic devices, and dangerous cosmetics. Of these, 187 were seizures removing the dangerous articles from the market, and 79 were criminal prosecutions against the concerns responsible for violating the Act.

Among the drug products held to be adulterated because dangerous to health when used in the dosage, or with the frequency or duration prescribed, recommended, or suggested in the labelling thereof, were products of the pain- and headache-reliever type containing such potent drugs as cinchophen, aminopyrine, barbituric acid derivatives, and combinations of bromides and acetanilid, and obesity treatments containing desiccated thyroid. In one instance the manufacturer of an effervescent laxative by mistake substituted a poisonous substance, tartar emetic, for tartaric acid, for which the formula called.

Seizures were made to the number of 65 of interstate shipments of sight-destroying eyelash dyes containing paraphenylenediamine or related compounds. Criminal prosecutions were directed against the responsible shippers. Seizures of eyelash dyes containing ammoniacal silver salts and pyrogallol were accomplished. Other cosmetics deemed dangerous leading to legal action were skin-bleaching creams containing mercury compounds, lipsticks containing cadmium and selenium, and a mole remover consisting of acetic and nitric acids.

The Act of 1938 provides that no new drug shall be introduced in interstate commerce unless an application has been filed establishing that it is safe for use. Most of the new-drug applications describe new combinations of known drugs which will cause no direct public-health injury, although in many instances it is questionable whether they possess the therapeutic properties claimed for them. A few of the new drugs submitted are distinctly new and possibly highly valuable. The Act places a serious responsibility upon the Food and Drug Administration; no valuable drug should be unnecessarily withheld from use; the release of drugs without sufficient testing to establish their safety must be avoided. The Administration's responsibility does not end when an application is made effective. Continued observation is essential to insure proper uses and the early discovery of any harmful results which may require reconsideration of the decision to permit traffic in the drug.

Under the Federal Food and Drugs Act of 1906 which was in effect until June 25, 1939, criminal prosecutions to the number of 278 involving interstate shipments of drugs were instituted and seizures of drug shipments to the number of 538 were effected. Under the import sections of the Act 1,148 consignments of drugs were denied entry into the United States. Notices of judgment to the number of 475 involving drugs were issued during 1939. (See also LEGISLATION, FEDERAL: *New Federal Food, Drug and Cosmetic Act.*) (W. G. CA.)

League of Nations.—Regardless of the degree of political ac-

tivity of the League of Nations, its drug work goes on. The Opium Section of the League Secretariat, the Permanent Central Opium Board, and the Opium Supervisory Body continue their valuable day by day work. The Opium Advisory Committee meets annually to investigate and report on existing conditions, to recommend action, to discuss illicit traffic cases publicly, and to ask any Government whose territory has been used as a base for illicit traffic to account for its stewardship. The Permanent Central Opium Board and the Opium Supervisory Body correspond with Governments, whether inside or outside the League, gather statistics, and perform their semi-judicial functions of regulating the lawful international traffic in narcotic drugs and imposing so-called embargoes when necessary.

Adherence to the various drug conventions is almost universal; 59 countries are parties to the Hague Convention, 53 are parties to the Geneva Convention of 1925, and 63 are parties to the 1931 Limitation Convention. The establishment of the system under the Geneva Convention of 1925 requiring Government certificates permitting import or export, and the limitation of manufacture under the 1931 Convention have proved to be the most important steps taken. The Geneva Convention of 1925 went a long way toward stopping licensed manufacturers and dealers from producing and selling narcotics for illicit purposes.

The 1931 Convention to limit the manufacture and regulate the distribution of narcotic drugs is working successfully. Under this Convention every country is expected to send to Geneva each year an advanced estimate of its next year's needs of each of the drugs. The supervisory body makes estimates for any country failing to do so. The Permanent Central Opium Board checks imports and exports continually against this list. If any country's imports exceed the estimates the Board notifies all Governments.

The results of the League of Nations' activities are evidenced by the reduction of the amount of morphine produced in licensed factories to the world's legitimate medical requirements. The production of heroin, the most dangerous of all habit-forming drugs, has decreased sharply. Cocaine production has dropped almost as sharply as heroin production. The estimated number of drug addicts in the United States has dropped from about 125,000 to less than 50,000. Similar reductions are reported from Canada and Egypt. France and Italy instituted prosecution against traffickers. Yugoslavia enacted new control legislation. Considerable progress was reported in areas in China under control of the Chinese National Government. As the dragnet tightens drug traffickers move from one country to another and set up secret factories in countries where control is weak or non-existent.

The unrestricted growing of the opium poppy and the coca bush are still serious international problems. The Opium Advisory Committee is elaborating a plan for limiting the production of the opium poppy plant.

Dry Farming. A longer rotation for dry farming, with emphasis on maintaining vegetative covering on crop land, was recommended at the Agricultural Adjustment Administration's 1940 program-planning conference July 10 to 12, 1939, in Washington, attended by 100 State-farmer committeemen. Four years of work to rehabilitate the Dust Bowl of the United States high plains has progressed so far that good crops are being grown, and agronomists from other countries with wind-blown areas to protect have come to the United States to observe

STRIP FARMING as a measure of soil conservation is taught in the grade schools of Springfield, Mo., a centre of progressive education

the reclamation work. Among these visitors have been scientists from Australia, Canada, Palestine, China, South Africa, and Argentina. The Washington conference in July decided that the need had passed for a special program for wind-erosion areas. Reclamation procedure, which began five years ago with 26 demonstration tracts in the heart of the Dust Bowl, has been continuously expanded and consists of contour plowing and terracing, strip farming, reseeding of large grazing areas permanently in native grasses, construction of numerous ponds and lakes and the planting of thousands of seedling trees as wind-breaks. Contour plowing and terracing prevent washing and enable the soil to absorb and retain rainfall. Strip farming, in which crops with soil-binding root systems alternate in narrow strips with loose-root crops, prevents wind erosion. Wild life is reported to have increased substantially in the restored grass lands and about lakes and sloughs built to store run-off of rain-water. The Dust Bowl droughts of a few years ago are said by some meteorologists to have been caused by cyclical solar variability, recurrence of which, it is predicted, will cause another intense drought in 1975.

(S. O. R.)

Ductless Glands: see ENDOCRINOLOGY.

Dust Bowl: see DRY FARMING; DUST STORMS.

Dust Storms may or may not represent land damage, according to their source. In inhabited regions, they are likely to be the manifestations of soil erosion by wind on agricultural land. In generally uninhabited regions, such as des-

erts and scab lands, dust storms may represent only the aerial redistribution of soil particles from one locality to another, without any particular attendant damage.

In arid or semi-arid agricultural regions, such storms tend to follow the removal of vegetation which normally protects and ties down the soil. In desert regions and other areas of arid climate and scant vegetation, the storms are virtually seasonal occurrences. In regions of either type, however, they vary with the velocity of the wind and the intensity of drought. Thus, a combination of unprotected dry soil, wind and prolonged aridity normally may be expected to produce a dust storm.

On the North American continent, where some of the world's most severe and damaging dust storms have occurred in recent years, there were no major dust storms during 1939. Some local dust storms occurred throughout the Great Plains.

Severe prolonged drought, which was more severe than in the autumns preceding the disastrous droughts of 1934 and 1936, affected the region between the Appalachian and the Rocky mountains; September and October were the driest months on record over most of the Great Plains. In some sections of the Southern Great Plains, or "Dust Bowl," wells failed, streams dried up, pastures burned and crops were badly damaged.

With farmers applying proper cultural methods, no major dust storms are expected in the spring of 1940, since it requires several seasons of drought to render the soil incapable of resisting winds.

On May 11, 1939, a minor dust storm occurred in the New England region of the United States reducing visibility to five miles and sunshine to 50%. Following the long summer drought, a similar local dust storm occurred on Long Island.

In the pastoral regions of Australia, where the rainfall rarely exceeds 10 inches, soil blowing is a severe problem. No major dust storms were reported, however, for 1939; but local blowing was noted in several regions.

In Africa, wind erosion affects a few areas, the most notable being Nigeria, where the Sahara is reported moving southward owing to the deterioration of the forest by burning and overstocking.

The northern half of the Anglo-Egyptian Sudan, the Sahara and other arid or desert regions of Africa, as well as Iraq and similar desert regions of Asia, again experienced severe sand and dust storms. These were not unexpected, since such storms have become periodic in those regions. (See also AGRICULTURE; DROUGHT; DRY FARMING.)

Dutch Borneo: see BORNEO; NETHERLANDS COLONIAL EMPIRE.

Dutch East Indies, the largest colonial possession of the Netherlands, consists of a huge archipelago, with several large islands, Java, Sumatra, Celebes, parts of Borneo and New Guinea, and many smaller ones, lying along the Equator from 6° north latitude to 10° south latitude, located south of the Philippines, south and east of the Malay peninsula and north of Australia. Capital, Batavia; governor-general, Jonkheer Dr. A. W. L. Tjarda van Starkenborgh-Stachouwer, appointed 1936. Area is 733,681 sq.mi.; population (1930) 60,731,025; estimate Jan. 1938, 65,000,000. The population (census, 1930) is divided as follows: Java and Madura, 41,719,524; Sumatra, 8,238,570; Borneo, 2,194,533; Celebes, 4,226,586; rest of the archipelago, 4,351,812. Largest cities: Batavia, 437,000; Surabaya, 373,000; Bandung, 167,000.

Education and Religion.—The great majority of the natives of the Dutch East Indies are of Malay stock and profess the Mohammedan religion. Educational statistics for 1937 were as follows:

Schools	Number	Teachers	Pupils
Public European primary schools	169	750	22,842
Private	108	697	22,595
Public Netherlands—Chinese	61	368	13,137
Private	45	282	10,392
Public Netherlands—Native	228	1,424	47,286
Private	112	695	24,500
Public and class schools for natives	2,372	6,187	218,793
Private	248	672	22,350
Village schools	16,961	32,399	1,677,971
Public Mulo-schools	32	258	5,977
Private	26	178	3,938
Public secondary schools	11	309	4,509
Private	12	148	2,108
Government high schools	3	90	1,038

The cost of the educational establishment was between 26,000,-000 and 27,000,000 florins.

In Java and Madura (1920) 6.5% of native males and 9.5% of native females could read and write.

Defence.—A colonial army of about 40,000, mostly natives with Dutch in the higher commanding posts, is maintained, together with a navy consisting of 2 light cruisers, 8 destroyers, 12 submarines, 2 gunboats, 5 minelayers, 8 minesweepers, 4 torpedo motor-boats, 1 surveying vessel and 1 training ship.

Finances and Banking.—The unit of currency is the Dutch florin (53.1 American cents in 1939). The Java bank is the bank of note issue for the Dutch East Indies and there are several other banking institutions.

Revenue in 1937 was estimated at 437,125,343 florins and expenditure at 461,564,145 florins.

Trade and Communication.—The trade of the Dutch East Indies in 1937 was valued at 963,507 florins for exports and 516,-292 florins for imports. The Royal Netherlands Indies Airways during 1937 covered 951,300 mi., transported 21,150 passengers, 77,280 kg. of freight, and 29,660 kg. of mail. The Dutch East Indies, especially Java, is rich in natural resources and has been intensively and efficiently developed. Among the main products are sugar, petroleum, tin, rubber, pepper, quinine, oil palms, tea, and coffee. The sugar industry, despite its low costs of production, experienced a serious crisis because of the world-wide trend toward restriction of sugar imports; the output of sugar declined from 2,843,000 tons in 1931 to 638,000 tons in 1936, but rose to 1,414,500 tons in 1937. Mineral production in 1937 was as follows: tin, 39,793 tons; crude oil, 7,262,070 tons; natural oil, 1,140,999 tons; coal, 1,363,506 tons. (W. H. CH.)

Dutch Guiana: see SURINAM.

Dutch Literature. True to the tradition according to which its culminating points in poetry, the year 1939, too, was rich in poetic production. P. N. van Eyck, who as the successor of Professor Albert Verwey now occupies the chair of Dutch literature in the University of Leyden, published a collection of poems *Herwaarts*, the first after a long period of silence. But it is especially the younger and youngest poets that attracted attention in 1939. To the former category belong the poets Mok, who published in rapid succession some epic poems of importance (*Exodus*, *Kaas-en broodspel*, *De Rallenvanger*); Van Hallum and Den Brabander. Others are younger; Van der Steen (*Controversen*) and Hoornik, who was awarded the prize for poetry of the "Maatschappij der Nederlandsche Letterkunde" (*Malthus*, *Geboorte*, *Steenen*). In connection with the work of this younger group that

of the poetess Clara Eggink (*Schiereiland*) should be mentioned. The periodical *Werk*, started in the beginning of 1939, also fostered a more outward consolidation of this group of young poets, a consolidation which will be continued by the periodical *Criterium* in 1940.

Side by side with poetry, the essay flourishes. Vestdijk, has published his masterly essays (e.g. on Emily Dickinson) in the important volume *Lier en Lancet*; also a new instalment of his autobiographical novel *Sint Sebastiaan*, and a collection of lyrical-epic fantasias: *Fabels met Keeurkrijt*. Some studies of larger scope have also appeared, namely a book about Shakespeare by Professor A. G. van Kranendonk, one on Diderot by Dr. Brugmans—a son of the lately deceased Amsterdam historian,—one on Chateaubriand by Professor Tielrooy, the two books by Du Perron about Meltatuli, and the posthumous volume by Professor Verwey about the great humanistic pioneer, Fred. van Eeden, well-known in England and America. Other works too bear testimony to Dutch humanistic culture: the important work of Professor Huizinja about the element of play in the development of civilization (*Homo Ludeus*), the second work of the aphorisms of Dirk Coster, the first part of whose *Marginalia* has been translated into English too, the series of studies *Europeesche Gest* under the editorship of Dr. Banning and Dr. Bierens de Haan and *Antisemitisme en Jodendom* edited by the Amsterdam philosopher Professor Pos.

Most of the novelists of reputation added a volume to their output in 1939 with varying success. We select for special mention *Het vergeten gezicht* by Albert Helman; and the names of Arthur van Schendel, the uncrowned prince of contemporary Dutch fiction, of Antoon Coolen, Henriette van Eyck, Maurits Dekker (the first volume of whose trilogy on the prince of Orange has been translated into English), of T. Boudier-Bakker, Herman de Man, the Flemish novelist Walschap, the married couple Scharten-Antink. (A. Dr.)

Duveen, Baron (JOSEPH DUVEEN) (1869–1939), British art dealer and philanthropist, was born at Hull on October 14, the eldest son of Sir Joseph Duveen, who founded the firm of Duveen Brothers, art dealers. The son developed this business until it was recognized throughout the world as pre-eminent in its field. After his education at Brighton college, Lord Duveen was employed by his father as a "runner" to purchase works of art. He acquired an exacting taste and in 1906 astounded the world of art by purchasing the Hainauer collection of Paris for \$2,500,000. His purchase of the Rodolphe Kann collection, which included 11 Rembrandts, for \$5,000,000 in 1907 was a record sum for that day. His philanthropies were on the same large scale as his purchases and sales. Notable among his gifts were several large collections and a new building to the Tate gallery, a gallery of Italian paintings to the National gallery, and a new building adjoining the National Portrait gallery. He also helped defray the expense of moving Spanish masterpieces to Geneva during the civil war. Lord Duveen, who was created a knight in 1919, a baronet in 1926, and baron in 1933, died at London on May 25.

Dyestuffs. Statistics for the year 1937 represent the latest available figures of international production of coal-tar dyestuffs. A slight decline over 1936 was noted. This was primarily due to a decrease of 9,000 tons in Germany's output and a corresponding falling off in the production of dyes by Russia and Japan.

On the other hand, the manufacture of dyes in Great Britain and the United States has shown an upward trend, expansion taking place on a sound and permanent basis. The United States has become self-sufficient insofar as dyes are concerned, the annual

production representing approximately 90% of the domestic consumption. The needs of colour-consuming industries are ably taken care of despite the chaotic situation existing abroad.

Table I—Production of Dyestuffs, 1925-37

Country	Production in tons	
	1925	1937
Germany	72,000	63,000
United States	38,000	61,122
Great Britain	15,000	31,633
Japan	—	11,769
France	16,000	11,400
Switzerland	9,000	7,700
Other Countries	15,000	17,868
Totals	165,000	204,492

Intensified research is still directed toward the production of dyes possessing a greater degree of fastness. The range of vat dyes is being constantly added to, thus catering to the demand of the consumer and processor for faster colour. Dyeing methods are also being studied with a view toward simplifying the application of colour to various types of textile fibres and other materials.

Table II—Exports of Dyestuffs, 1937

Country	Tons	Value
Germany	42,400	R.M. 148,266,000
United States	8,350	\$6,250,000
Great Britain	5,728	£1,305,544
Japan	6,681	Yen. 6,269,000
France	4,728	—
Switzerland	7,113	Sw. Frs. 83,264,575

(A. G. B.N.)

Dyson, Sir Frank (Watson) (1868-1939), British astronomer, was born on January 8 at Ashby, England, the son of a Baptist minister. Educated at Trinity college, Cambridge, he became secretary of the Royal Astronomical society in 1899. In 1910 he was appointed Astronomer Royal, a position he held for 23 years until his retirement in 1933. See *Encyclopædia Britannica*, vol. 7, p. 819. He died at sea on May 25 while on a voyage from Australia to South Africa.

Ear, Nose and Throat, Diseases of. The voice is the chief consideration in the treatment of most laryngeal conditions, but in cancerous conditions it must be relegated to second place. During 1939 operations on the larynx were systematized and improved. Operations by means of direct laryngoscopy are performed on a number of small benign growths with resultant vocal restoration provided the underlying tissues have not been damaged or inflammatory states taken place.

Where cancerous growths are found within the larynx, especially on one or both cords and not attached elsewhere, the operation of laryngofissure is performed. This operation splits the thyroid cartilage and removes the intrinsic malignant disease without removal of the entire larynx. If one or both cords must be removed, a procedure which the laryngeal surgeon must often decide and perform, the results thereafter have been first class. The voice, too, in time returns even after the removal of one or both cords.

For cancerous states involving more than one cord, it may be necessary to remove the entire larynx (laryngectomy). Results for life are excellent, but it is interesting that these cases develop a voice; the mode of production, though different from the normal method, is based upon the same principle. Since the patient no longer has a pair of vibrators (the vocal cords), the collection of air in the lungs would not be of value in voice production. As soon as healing permits after the operation, the patient is taught to collect air in his hypopharynx, oesophagus, and stomach

to replace the air column from the lungs and to produce tone by means of vicarious cords formed in the hypopharynx or pharynx. It is important to remember that the "moulds of speech" (tongue, lips, cheeks, palate, etc.) form the words. The patients are given thorough training in the method of producing articulate speech by using the physiological rhythm of respiration. Occasionally they may try, if it is found necessary, a mechanical appliance known as the "artificial larynx."

Hygiene of Swimming.—Observations in past years revealed the fact that many swimmers developed sinus and ear infections, of varying degrees, and occasionally complications from these structures would take place in the mastoid bone, the meninges or brain. Investigators found polluted water in some pools.

H. Marshall Taylor conducted a series of researches with the following conclusions: 1. There are several factors other than water pollution that enter into the genesis of infection of the sinuses and ears during swimming. 2. Chilling of the body surfaces without concomitant exercise lowers the body temperature and lowers the white blood cell count (defensive mechanisms). 3. Man does not possess the mechanisms that aquatic animals are endowed with. 4. Man is a terrestrial animal. 5. Aquatic animals are able to prevent water from gaining entrance into the upper respiratory tract and external auditory canal, as well as to maintain a normal body temperature in cold water. Man is unable to do any of these because he does not possess the mechanisms therefor. 6. The manatee (*Trichechus*) closes its nose on submerging in the water. The hippopotamus can do likewise. The porpoise closes its blowhole on submerging, and the seal can close its nose and ears on submerging.

From his studies he offers the following valuable advice: 1. Man should not allow himself to be chilled, especially on the beach or swimming pool. He should be constantly active physically instead of sitting around in a cold wet bathing suit. Body temperature should be conserved by suitable wraps instead of allowing rapid loss of body heat by evaporation. 2. Water macerates the epidermis and since man cannot close his ears, he should put rubber ear stoppers or plugs of oiled wool or cotton in the ear canal while swimming. This will prevent external otitis, furunculosis and similar infections. 3. Diving should be performed skillfully. Diving feet first entails danger of the water rushing into the nares. The swimmer should inhale deeply through the mouth just before diving and then exhale slowly through the nose while under water. 4. Proper breathing is the only method that man possesses to protect the mucous membrane of the nasal passages when swimming. He should exhale through the nose while the head is submerged and inhale through the mouth while the head is above water. The positive air pressure in the nasal cavities protects the sinuses and the eustachian tubes from water.

Sulphanilamide.—Though it is true that patients with streptococcal mastoiditis got well without sulphanilamide, nevertheless this drug has proved immensely valuable. Maybaum, Snyder, and Coleman state that this drug has resulted in a genuine advance in the treatment of certain otogenous infections. They state that massive doses in the earlier stages controlled by determinations of the concentration in the blood have given them the best results.

Many reports of striking results have been obtained in meningitis due to streptococcal haemolytic infection secondary to otitis media and mastoiditis by the adjuvant use of sulphanilamide. Neal, Applebaum, and Jackson state that during a period of more than 26 years they have had a recovery of only 15 cases out of 274. Nine of the cases which recovered had been due to the streptococcus haemolyticus. Since 1937, by using sulphanilamide along with tested procedures, they have had a total of 19 cases—14 recoveries and 5 deaths.

Surgical Treatment of Otosclerosis.—This disease is characterized by a progressive loss of hearing, particularly of the low tones, persistent tinnitus, absence of catarrhal or suppurative states in the nose, accessory sinuses and middle ears, and the usual findings of a normal drumhead (tympanic membrane) and a permeable eustachian tube. Though it may occur at any age, it has most often been first found in the young adult. Females are more predisposed than males. It is often hereditary. Pathologic investigations have revealed spongification of the bony capsule of the labyrinth followed by ossification (osteoporosis followed by osteosclerosis). The movement of the stirrup (stapes) is lost because of an ankylosis of its foot piece into the oval window (fenestra ovalis). The ankylosis may be due to ossification processes in the framework of the stapes, in the niche of the oval window, or both. Other focal sclerotic processes have been found in the bony capsule by many investigators.

Years ago Jenkins and Barany attempted a surgical approach to this problem, and they were led to conclude that an improvement in hearing could be obtained by making a new "window" (fenestra) in the bony capsule of the labyrinth. Later Holmgren and Sourdis performed a number of operations, using certain techniques that they themselves developed and perfected with conclusions of vast importance. Further observations of the operated cases at time intervals disclosed a gradual loss in hearing to the level before operation. Investigations and researches brought out the fact that the new "window" (fenestra) did not remain open but began to close because of bony regeneration. How to keep the "window" (fenestra) open remains the important problem, for closure of the fenestra by bony regeneration will lead to ultimate failure of the operation.

Julius Lempert of New York had undertaken the study of the surgery of the temporal bone. He developed and perfected a surgical approach and technique for instituting drainage in cases of acute and chronic mastoiditis. The approach differed from all others. He created a mobile window in the membranous and extracartilaginous portion of the external auditory which gave him an approach to any part of the temporal bone. It is technically termed the endaural, antauricular surgical approach to the temporal bone.

He continued his studies on otosclerosis with the view to developing certain fundamentals that might lessen the time factor in the complete operation as well as obtain a permanently open fistula of the labyrinth by mechanically preventing regeneration of bone. He set out, in his anatomic studies, and later in his operations on patients, to carry out the steps as he had created them. The result is his one-stage endaural plastic reconstruction incorporating the following principles: 1. The decompression and mobilization of the fluid beneath the bony capsule (the perilymph) by surgically constructing a trough-shaped fenestra ("window") in the bony capsule of the external semicircular canal. 2. The preservation of this surgically created mobility of the labyrinthine perilymph by replacing the removed area of bony labyrinthine capsule with a suitable and durable membrane which is inserted into the fenestra and maintained permanently in direct contact with the perilymph. 3. The arrest of the progressive labyrinthine venous stasis by decompression of the dura of the temporal lobe in the region of the epitympanic recess. This one-stage operation takes anywhere from three and a half to seven hours to perform and requires the utmost skill and finesse. Of the 23 cases operated on, practical improvement in hearing was obtained in 19, none in the remaining 4 cases. Of the 23 cases, the newly created fistula of the external semicircular canal remained open in 22.

Earle, Ralph (1874–1939), U.S. rear admiral and educator, was born May 3 in Worcester, Mass., and graduated from the U.S. Naval academy in 1896. He was appointed ensign in 1898, commander in 1915, and rear admiral in Sept. 1930. He originated the mine field across the North Sea known as the Northern Barrage, plans for depth charges, and many other naval ordnance projects. In 1925 he retired as commander of the Naval torpedo station in Newport, R.I., to become president of Worcester Polytechnic institute. He died February 13 after an attack suffered while addressing Worcester students at chapel exercises.

Easley, Ralph Montgomery (1856–1939), U.S. political economist and reformer, was born at Frederick, Ill. on February 25. In 1900 he organized, in New York city, the National Civic Federation, of which he was executive chairman until his death. During his career he promoted conferences on a wide variety of topics, including taxation, the reform of primary elections, immigration, trusts, and the foreign policy of the U.S.A. He also organized the League for National Unity in 1917 and was author of numerous works on public questions. He died at Rye, N.Y., on September 7.

Ecuador, a South American republic situated astride the Equator on the Pacific; language, Spanish; capital, Quito; provisional president, Dr. Carlos Arroyo del Río (resigned Dec. 11, 1939), A. F. Córdova. The area, including the Galápagos Islands (2,400 sq.mi.), is 337,392 sq.mi., according to Ecuadorean claims, but over 100,000 sq.mi. is disputed with Peru. Population (1935 est.) is 3,414,106. The chief cities are: Quito, 140,000; Guayaquil, 120,000; Cuenca, 42,000; Riobamba, 21,200.

History.—Throughout 1939 internal disorder threatened in Ecuador. In January and in March minor disturbances attributed to leftist elements and accompanied by strikes were suppressed. Again in July, a revolutionary outbreak was thwarted when the Government arrested several prominent political and military figures. Moderate tension continued through the year. Meanwhile,

on January 15, under the constitution of Dec. 1938, congressional elections were held. In them women voted for the first time. The new congress convened February 2 and confirmed Dr. Aurelio Mosquera Narváez in the presidential office to which the subsequently dissolved constituent assembly of 1938 had named him on December 2, but rejected the constitution approved by that body. In March, when it was proposed in the United States Congress that the United States purchase or lease the Galápagos islands for use as part of the Panama canal defences and to prevent their seizure by any European power, there was great indignation throughout Ecuador, and in May the Government formally and absolutely disavowed the proposal. Upon the outbreak of the European war, Ecuador declared her neutrality and, on October 20, in general accord with the Declaration of Panama (*See HISPANIC AMERICA AND THE EUROPEAN WAR*), proclaimed the neutrality of a zone extending 500mi. westward from her shores and including the Galápagos islands. War conditions caused a sharp retail price rise of 10% to 20% in Ecuador, and at the same time a decline in agricultural prices, with consequent economic ill effects. On November 17, President Mosquera Narváez died, and Dr. Carlos Arroyo del Río, president of the Senate, succeeded as provisional president. In conformity with constitutional requirement, he called a presidential election for Jan. 11, 1940, and subsequently announced his own candidacy. Other candidates included Dr. Jacinto Jijón y Caamaño, leader of the Conservative party, who left Los Angeles, Calif., in December to take part in the campaign, and former president José María Velasco Ibarra.

Education.—Ecuador has 2,239 elementary schools (enrolment over 180,000), 21 secondary schools, and four universities (at Quito, Guayaquil, Cuenca, and Loja).

Army and Navy.—Ecuador has an army of around 7,500 men, and a national police force of 3,500 for maintenance of internal order. Military service is compulsory.

Finances.—The monetary unit is the sucre (value: approx. 6½¢ U.S.). The 1940 budget calls for 113,050,000 sucres, a 20% reduction in spite of the decline of the sucre.

Trade and Communication.—External communication is by sea (almost entirely through Guayaquil) and north and south by air. Railway mileage totals over 600 miles. There are approximately 3,000mi. of highways, with around a third of the 1,090km. Inter-American highway link through Ecuador still under construction.

Imports and exports in 1938 rose in terms of the sucre, due to its fall in international exchange, but fell in volume and in dollar value to \$11,064,000 and \$12,614,000 respectively (\$11,980,000 and \$14,928,000 in 1937). Imports (foodstuffs, machinery, textiles, and other manufactured goods) came largely from the United States (34.6%), Germany (24.1%), Great Britain (7.7%), Japan (7.4%), and France (4.4%). Exports (cacao, gold, oil, and coffee) went chiefly to the United States (37.5%), Germany (17.5%), France (8%), and Great Britain (4.6%). Cacao is the principal export commodity. Oil is also important. In 1939 Ecuador produced 2,265,000bbl. (est.) of oil (2,249,740bbl. in 1938 and 1,617,000bbl. in 1934). (L. W. BE.)

Eden, (Robert) Anthony (1897–), British statesman, was born June 12 and was educated at Eton and at Christ Church, Oxford. After service in the World War (1915–18), he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. From 1926 to 1929 he was parliamentary private secretary to Sir Austen Chamberlain. He then became under-secretary for foreign affairs and, in 1934, lord privy seal and a privy councillor. In June 1935 he entered the cabinet as minister without portfolio

for League of Nations Affairs, holding this post until the following December, when he succeeded Sir Samuel Hoare at the foreign office. His tenure was marked by an ardent championship of the League of Nations and by progressive loss of confidence in the German and Italian Governments. Disagreement with the prime minister on the latter score led to his resignation on Feb. 20, 1938. Eden, however, refrained for the most part from attacking the Government for not seeing eye-to-eye with him on the best methods of negotiating with Hitler and Mussolini.

Late in 1938 Eden made a visit to the United States, where he received a friendly welcome in New York city and declared in an address there on December 9 that Britain would never surrender its democratic ideals and would not ask the help of other nations in protecting them. After July 1939 there were persistent rumours that he would re-enter the cabinet, and on September 3 he was appointed secretary for the Dominions, without a seat in the war cabinet but presumably with intimate access to its deliberations. He was then chosen to deliver the British reply to Germany's efforts (voiced especially in a speech by Goering on September 9) to persuade France to make a separate peace after the conquest of Poland. In an international broadcast on September 11 Eden declared that "there can be no lasting peace until Naziism . . . is banished. . . ."

Edison, Charles (1890–), U.S. Secretary of the Navy, was born at Llewellyn Park, West Orange, N.J. on August 3, the son of Thomas A. Edison. He was educated at Massachusetts Institute of Technology and in 1913 joined his father in business and research. As president of Thomas A. Edison, Inc. he directed the many corporations set up to manufacture and distribute the products invented by the elder Edison. He was appointed Assistant Secretary of the Navy by President Roosevelt Nov. 17, 1936, and became Acting Secretary upon the death of Secretary Claude A. Swanson July 7, 1939. Previously he had been assistant to the administrator of the NRA and regional director of the Federal Housing Administration. Roosevelt appointed him Secretary of the Navy on Dec. 30, 1939.

Education. The educational literature of the year 1939 was marked by an unusually vigorous emphasis upon the place of education in American democracy and on the responsibility of education for defending and advancing the ideals of American democracy. The contest for public taxes grew more intense than formerly. In addition to the drastic cut in the school program in New York State, other States showed a tendency to encroach on the public school dollar, under the pressure of increasing demands for appropriations for relief, old-age pensions, social security, roads and other public services. Educational leaders throughout the U.S. were frightened at these demands, as worthy as they may be, and were afraid that the schools would be crippled. The question that agitated some of them was: "Which is more important, the care of the old people or the education of the children?" Attracting notice also were the continued decline in elementary school enrolments, increased enrolments in secondary schools and in higher educational institutions, continued interest in the revisions of curricula, the growth of the junior college movement, the expansion of vocational education and of adult education and the increase in the number of adult forums, a decline in the pressures for loyalty oaths for teachers, an increase in the strength of opinion in regard to the tenure and retirement of teachers, and the creation in the Office of Education in Washington of a Guidance Division and the placement of that division in the Federal Security Agency.

Congress on Education for Democracy.—This unique convention was held at Teachers college, Columbia university, New York

GIRL TUMBLERS of the Oakdale, Calif., Union high school made a lengthy and successful tour of the Pacific coast in the spring of 1939

city, August 15, 16, 17, 1939, and attracted considerable notice. It brought together educators and laymen, who were representative of many phases of American life, to consider and discuss the question of the responsibility of education "for the defense and advance of democracy." There were many general meetings and about a score of seminars. A report on the discussions and recommendations of the seminars was made at the closing meeting of the congress. One of the recommendations called for the appointment of a "Continuation Committee to consider the results of the present Congress and to prepare specific plans for further activities." It was also recommended that such a committee should consider how to "collect the crucial problems of American democracy and how to get adequate information in relation to them."

Institutes on Professional Relations.—During the summer of 1939 more than 30 higher educational institutions from the Carolinas to Oregon co-operated with the National Education Association and their respective State education associations in "institutes" on professional relations. A representative of the National Education Association worked with these institutions and associations in the organization of the institutes, which were attended by a large number of people engaged in educational work. The National Education Association also sponsored several radio programs over national networks. President Amy Hinrichs, of the National Education Association, announced the appointment of a committee of that organization to co-operate with the American Legion on educational matters. At the San Francisco convention of the National Education Association the name of the "Department of Secondary Education" was changed to "Department of Secondary Teachers." Three new departments were created: the Department of Garden Education, National Association of Journalism Directors, and National Association of Teachers of Speech.

The American Federation of Teachers, at a meeting at Buffalo in Aug. 1939, adopted a unanimous resolution which endorsed the "progressive policies of the national administration in regard to education and labor." It also asserted that the report of Presi-

dent Roosevelt's Advisory Committee on Education had served to arouse wide interest in and support of Federal aid for education. Interesting also were resolutions of the organization urging freedom of teachers to present and discuss "relevant materials of a controversial nature" and the freedom of the teacher "to live his personal life and conduct himself in private with the freedom accorded other citizens." Professor George A. Counts, of Teachers college, Columbia university, was elected the new president of the Federation.

During the summer of 1939 several "Workshops" in the field of secondary education were conducted in a number of institutions in various parts of the U.S. All of these enterprises, except the workshop of the Southern Association of Colleges and Secondary Schools, conducted at the University of North Carolina, were carried on in co-operation with the Committee on Workshops and Field Service of the Progressive Education Association.

School and Society.—Early in Sept. 1939 announcement was made that *School and Society*, one of the most important American educational magazines since the early 20th century, was to be published by the Society for the Advancement of Education, a non-profit organization formed to maintain and promote that journal and to "foster other related enterprises designed to advance the interests of education." Distinguished American educators were named as trustees of that organization. The general editorial policy of *School and Society*, founded in 1915 and edited since that time by J. McKeen Cattell, will not be changed. But the magazine is now to be edited by William C. Bagley, who in August retired from a long and distinguished service as professor of education in Columbia university.

The Regents' Inquiry.—The completion of the Regents' Inquiry into the Character and Cost of Public Education in the State of New York, and the publication of numerous studies by the inquiry attracted considerable attention throughout the U.S. This survey constituted a most comprehensive examination of education in that State. Owen D. Young was chairman of the special committee of the inquiry, which began several years ago. Luther H. Gulick was director and Samuel P. Capen was associate director. Staff members were drawn from many institutions throughout the U.S. During 1939 there was wide discussion of the findings, in which the regents hoped that "The State of New York and its independent school communities may thus continue to make their contribution to the advancement of education for American life." Each of the "Studies," which the inquiry published, contained significant findings and made specific recommendations in the respective fields treated. It was found that there were in the State of New York 8,000 school districts, some of which had the same metes and bounds as were given them under an act of 1812, nearly 19,000 school officers, about 82,000 teachers, about 2,000,000 pupils, more than 5,700 one-teacher schools, expenditures for schools (1935) more than \$277,900, school properties valued at \$1,000,000,000, State educational aid in the amount of \$120,000,000, 18 subjects in the elementary school and 63 in the secondary schools. In the light of increasing competition among the 1,700 or more higher educational institutions in the United States were two interesting recommendations of the inquiry. One was to amend the law so as to limit "very rigorously incorporation of further independent general arts colleges and universities." The other was to extend the secondary school program beyond the twelfth grade, in the direction of the establishment of junior colleges at public expense. The Educational Policies Commission continued its activities and issued valuable publications. Among these was *Social Services and the Schools*, which defined the sphere of educational service and proposed policies with regard to schools, public health, public welfare, recreation and libraries. Important also was an activity of the commission which was inaugurated in

July 1939, to study ways in which the school can develop in young people intelligent and active loyalty to democratic ideals. In September the commission issued its report on *Federal Activities in Education*, the most comprehensive statement made since the National Advisory Committee on Education made its report in 1932.

Federal Aid.—The hope of many educational leaders that the congress would make early and considerable progress toward carrying into effect the recommendations of the President's Advisory Committee on Education in regard to Federal aid for education was not as lively at the end as at the beginning of 1939. The Harrison-Thomas bill (S.1305) and the Larrabee bill (H.R. 3517) carried over into the third session of the 76th Congress with the exact status that they had when the first session adjourned in August. The Senate bill was ready for a vote by the Senate, having been favourably reported in the first session by the Senate committee on education and labour. The House bill awaited a hearing by the House committee on education.

The Commission on Teacher Education of the American Council on Education began a "cooperative study of teacher education," which involved 20 higher educational institutions and 14 school systems and groups of school teachers. This commission was formed in 1938 to conduct a study of this subject for a period of five years. Carl W. Bigelow was made director of the study, the purpose of which is to encourage the rapid passage into practice of the best knowledge available concerning the education of teachers in the United States. The commission also seeks to stimulate experimentation with programs of the education of teachers and the growth of teachers in service. The commission held a conference at Bennington college, Vermont, in Aug. 1939, attended by more than 100 people who represented many groups who are engaged in the work of the education of teachers. The Cooperative Study of Secondary School Standards completed its work during 1939 and offered its publications to secondary schools, to libraries, to teachers of courses in secondary education, and to State, regional, and national groups interested in materials for the improvement of the work in secondary schools. The sum of approximately \$200,000 was expended by this study during the years 1936-39 "in the development and refinement of these materials," which were carefully tested in 200 secondary schools of all sizes and types throughout the United States.

Division of Cultural Relations.—This division was established in the Department of State under a departmental order issued by Secretary Cordell Hull in July 1938, for "the purpose of encouraging and strengthening cultural relations and intellectual co-operation between the United States and other countries." The functions

of this division are under the general supervision of the under-secretary of State and in very close co-operation with the geographical divisions of the United States. Ben M. Cherrington was appointed chief of this division. The National Committee on Science Teaching, sponsored by the National Education Association through its Department of Science Instruction, with other national bodies co-operating, began its work of improving instruction in science in the schools of the United States. Broad participation of the science teachers of the nation, working in co-operation, was sought. Two district meetings were held during the summer of 1939, one in San Francisco and one in New York, and another meeting was held in Chicago in October. The Committee on Salaries of Teachers of the National Education Association held several meetings during 1939. A major activity of the committee was the preparation of a preliminary work on a handbook of principles on teachers' salaries and salary scheduling, and a summary report of opinions of the advisory committee in regard to policies of salaries was issued in June. This summary reveals wide differences of opinion on certain issues on that subject, but it is believed that these differences can be eliminated by conference.

A two-year study of College and University Education for Negroes was undertaken, to be conducted by the United States Office of Education. Fred J. Kelly, chief of the Higher Education Division of that office, and Ambrose Cliver, specialist in the education of Negroes, were named director and assistant director, respectively. For this study Congress had appropriated \$40,000. The

GRADE-SCHOOL CHILDREN of West Dallas, Tex., established their own "court of justice" in the spring of 1939 to try violations of playground rules

first meeting of the advisory committee, which consists of a score or more specialists in the subject, was held in Sept. 1939. The importance of the study was emphasized by the decision of the Supreme Court of the United States in the *Missouri Case* in 1938.

In this case the court held that a Negro citizen of Missouri must be admitted to the law school of its university, unless facilities equal to those in that institution were provided for him elsewhere in Missouri. This decision affected 17 Southern States which, under their constitutions and laws, have long followed a policy of separation of the whites and Negroes in schools. Some of those States undertook to make a beginning during 1939 to meet the demands of that decision, one of the most significant decisions affecting education in the United States in many years. A unique effort to provide graduate and professional work for Negroes was made in the North Carolina College for Negroes at Durham, where Duke university is located. Several members of the faculty of that university and several members of the faculty of the University of North Carolina, located 12 miles away, began in September offering graduate courses in the North Carolina College for Negroes, and this co-operative work will continue until that institution is able to provide its own graduate staff. (See also ACADEMIC FREEDOM; UNIVERSITIES AND COLLEGES.)

(E. W. K.)

British Empire.—The tendency towards educational reform in the British Commonwealth is increasingly evident. In those Dominions where education was traditionally looked upon as a matter of local or provincial interest a national outlook has been gradually formed, followed by reorganization of administration and finance within the provinces or states, and centralization of supervision on a national basis. In New Zealand, on the contrary, the same aim led to the strengthening of the local authorities. The diverging systems of the four Dominions, Canada, Australia, New Zealand and South Africa, aim at a balance of central and local control which was achieved in England after a long historical process. This community of ideas is noticed in other aspects of education as well. The differentiation of post-primary education with adaptation to local needs, the development of new "activity" methods, the promotion of physical culture, the introduction of broadcasting services into the school and the growth of medical service are typical features of recent advances common to Great Britain and all Dominions.

Canada.—The opinion of provincial departments is definitely moving towards national conception of Canadian education and Federal grants as means to the end. The Royal Commission on Dominion-Provincial Relations is expected to publish a relevant report soon. The Federal-Provincial youth-training project, in 1939 had over 15,000 young people in courses for rehabilitation. The Canadian Council for Educational Research was founded by the provincial departments, the Canadian Teachers' Federation with assistance from the Carnegie Corporation, New York.

In Ontario, the consolidation of small rural schools is continued.

In 1938-39, 27 more schools, and 68 rural schools were united into 14 districts. In Quebec, the French Canadians completed the reform of normal schools. The Catholic religious normal schools now require the same qualifications as the lay schools. In Nova Scotia, various types of school administration were examined. In Prince Edward Island, compulsory age was raised from 13 to 15 years. In Manitoba, the special commission on revision of programs continued its work. More emphasis would be laid on "activity" methods. In Alberta, approximately 90% of all rural schools have now been reorganized into 44 school divisions. In British Columbia, the revised programs for high school grades were introduced in 1938-39.

Australia.—The Commonwealth Government has departed from its previous policy of non-intervention in education. It is now awarding grants in aid of rehabilitation and training schemes for unemployed youth. All six States submitted schemes which were approved by the Commonwealth Government and are now administered by the States. Pre-school child development centres have been established in the six capital cities. In New South Wales, many reforms are under consideration. In technical education increased facilities were made available by the building of several new technical colleges. In Victoria, a reform movement similar to New South Wales has been organized. A new technical school was opened at Preston and a new Food Trades school with accommodation for 1,350 students is under construction in West Melbourne. In South Australia, a consolidated central school has been established as an experimental rural school for post-primary children. A considerable advance was made in the use of visual education.

In Tasmania, the development of "area schools" continues. In 1939 four more were added.

New Zealand.—The bill introduced in 1938, the main purpose of which was to strengthen the local education authorities, is still in the committee stage but the restrictions on the employment of married women have been repealed, the Council of Adult Education established, and grants to education boards increased. The consolidation of rural schools is now going on more rapidly; and agricultural clubs number well over 15,000.

Union of South Africa.—In 1939 the National Bureau of Educational and Social Research published the first issue of the "Bulletin of Educational Statistics." A national, Union outlook in education is now transcending the provincial differences. The education of abnormal children has become compulsory, the responsibility being divided between the Union and the provinces. In the Cape province medical service and physical culture training have been extended. At three agricultural schools handed over by the Union Government courses were especially adapted to farming needs and in 11 primary schools curricula have been changed to suit the rural or industrial occupations of respective communities. In Transvaal, the centralization of rural schools around one farm school continued, resulting in the elimination of about 100 small schools. The number of pupils continuing their studies beyond the primary stage increased to 63%. In the Orange Free State, the

first report of the vocational guidance officer emphasized the necessity of differentiated post-primary education. The necessity of academic education for all European children was emphasized.

Eire.—A consultative council of education has long been desired by the Irish National Teachers' Organization. In 1939 the Commission on Voca-

*For 1936-37.

tional Organization was appointed, which is investigating the establishment of "functional organization" and the "rights and powers" which should be conferred on such a body. The language policy of the Government continued to make progress, especially in the secondary schools. In 1938 about 10,000 pupils earned the grant given to pupils who speak Irish at home. A new Gaelic hostel for children was opened in county Meath. The Institute of Mathematical Research was inaugurated by the prime minister in 1939. The experiment of raising the school-leaving age from 14 to 16 years showed good results.

British India.—An improvement in educational services has been noticeable during the past two years in an increase of enrolment in the upper forms and considerable increase in female enrolment. In Bombay the revised syllabus of primary schools, which is more practical and child-centred, was adopted by the provincial committee. The Committee on the Training of Primary Teachers recommended the raising of standards and the establishment of special vernacular three years' secondary schools (after seven years of primary education), the so called *Lokshala*, which should serve as preliminary stage for training colleges. In Madras decentralization was marked. Lower classes of secondary schools were abolished in 1938-39. One-teacher schools were reduced in number by 3,000. In Punjab some districts have abolished small schools altogether. Compulsory attendance under the present conditions has so far failed to produce the desired result. In the United Provinces a provincial committee is considering the reorganization of the school system to incorporate the middle schools into the elementary stage thus providing complete non-academic education. In the Central Provinces and Berar there is a noticeable increase of enrolment of depressed classes, but decrease in numbers of aboriginal hill tribes. The prevalent unemployment among educated classes is being studied.

BIBLIOGRAPHY.—*The Year Book of Education* (1939); *Annuaire International de l'Education* (1939); *Annual Reports* of all the Dominions, Provinces, and States of Canada, Australia, New Zealand, South Africa, Eire, British India, also reports mentioned in the article. (N. H.A.)

General World Trends.—It would be difficult to overemphasize the influence that the European war has already had upon education and will in all probability continue to have during the year 1940. It has disrupted education in the belligerent countries and has profoundly influenced the attitude towards education in non-belligerent countries. The need of evacuating schools in big cities like London and Paris because of fear of air raids and in possible combat areas like Alsace and the Rhineland resulted in the movement of millions of children to rural districts, causing profound changes in educational methods and community life that will probably be emphasized during 1940. With the exception of London and Strashourg, the universities of Great Britain and France opened their doors as usual. Germany closed all the universities save five. In all these countries, however, university education was conducted upon a reduced scale. Students were mobilized, professors called upon for particular kinds of service, courses of a more limited nature offered. In the countries where mass fighting has taken place, Poland and China, education has been practically destroyed. The aggressor countries, Germany and Japan, have reduced to ruins schools and universities, and neither Germany in Poland nor Japan in China has any desire to reconstitute education. In the parts of China still controlled by the National Government makeshift schools and universities have been established. Obscurantism and regressive policies which flourished in the totalitarian countries during 1939 will in all probability flourish during 1940. The very word "totalitarian" implies that the State is to decide in *all* things: what its people shall read in the newspapers and hear over the radio, whether its authors shall be permitted to publish books containing views not favoured by the State, or cinema companies show pictures disliked

by the State, or private organizations carry on activities dis-trusted by the State.

The great enemy of democracy, Germany, has continued to emphasize the doctrines of Aryan superiority and race solidarity. Aryan superiority and race solidarity mean the exclusion from Germany of all alien elements like the Jews who are now excluded from all education except what they can supply themselves. Recent regulations of the ministry of education provide that the Nazi Party alone will determine who may attend the universities. The regulations also reduce the length of vacation, insist upon the importance of practical and technical subjects, and in every way emphasize that university education is not to be determined by the preference of the individual but by the will of the State. The German view of the place of education in the State has had a profound influence upon education in every other totalitarian country with modifications determined by conditions. Japan does not hold to Aryan supremacy but she does, as do all other totalitarian countries, hold to race solidarity. Moreover, anti-liberal views on subject matter, old-fashioned methods of teaching and rigid discipline have almost everywhere accompanied the appearance of totalitarianism in any country, e.g., Spain.

Wherever German influence has extended, as in Italy and Japan, anti-Semitism in the schools has accompanied it, resulting usually in the expulsion of Jewish teachers and scholars. It will be a long time, if ever, before Jews will regain the place of eminence they have hitherto held in the intellectual life of totalitarian countries. In Italy the Grand Council of Fascism has promulgated a new Charter of the School providing for a complete reorganization of education. Compulsory school attendance begins at four and continues to 14. The practical subjects are to receive increased attention and the classical subjects less. The fact that education is exclusively for purposes of the State is everywhere emphasized. The implementation of the Charter of the School was postponed because of the European war. In Soviet Russia there has been a great emphasis upon nationalism and patriotism instead of socialism as necessary for the defence of the "Socialist Fatherland." An increased emphasis upon nationalism and patriotism will undoubtedly be made in 1940.

The democracies have not remained unaffected by the events of 1939. In every democratic country there has been a resurgence of faith in democratic institutions and a determination to safeguard them. This attitude has been reflected in the school. Criticism of most aspects of the school, its organization, curriculum, discipline, examinations, has been prevalent. The demand is that the school must be made a more efficient instrument for preparation for life in a democracy. But the ideal everywhere emphasized is the individual student as a future citizen having definite duties toward the State. (S. D.N.)

Nursery Schools.—The latest U.S. Office of Education survey, made in 1936, lists 285 of the permanent type of nursery schools. This is a minimum figure since many fail to report. Of these, 51% are in full-day, and 49% in half-day session; 50% are supported by tuition, 27% by universities, 19% by philanthropic organizations and 4% by public schools. The typical age range is two to five years. In addition to the primary service given children, schools function as centres for research, teacher training, parent education, and, in public high schools, as centres and laboratories for pre-parental training in child care and family relations. The high professional training of nursery school workers is shown by the fact that 31% have bachelor's and 41% master's or doctor's degrees.

In 1939 both housing authorities and welfare agencies were much concerned with the type of service they gave young children and in some instances included nursery facilities in their planning. In recent years many day nurseries have been converted into

nursery schools with trained staffs. The outstanding program of the Works Progress Administration has continued at the level of 1,500 emergency nursery schools with 45,000 children enrolled. State and local contributions to their maintenance are increasing. (See also EDUCATION, ADULT; EDUCATION, ELEMENTARY; EDUCATION, PROGRESSIVE; EDUCATION, SECONDARY; EDUCATION, VOCATIONAL.) (J. E. A.)

Education, Adult.

Paradoxically, the greatest progress in recognition by the public of the close interdependence of adult education and democratic processes has occurred in a year in which open armed warfare against democratic ideologies has broken out. During the first eight months of 1939, the high importance of the education of mature persons to the functioning of democratic self-government in the nations still adhering to such systems has been emphasized again and again by statesmen and educators. Two weeks before the outbreak of war, Earl Baldwin of Bewdley, speaking before a world Congress on Education for Democracy assembled by Teachers college, Columbia university in New York, affirmed that a democracy could only be as strong in its faith as the education and understanding of its citizenry afforded. This view was also stoutly expressed by the many educators and laymen participating, all of whom evidenced the increasing extent to which the democratic peoples were relying upon adult education for the protection of their institutions, their culture, and their way of life. By and large, the world movement for adult education has suffered serious losses in 1939. In addition to the belligerent nations, in which educational activity perforce gives way to war activities, the strong movements in Czechoslovakia and Poland, like that in Austria in the preceding year, have been laid waste by the invader. Their replacement by the propaganda agencies of the conqueror reduces their scope to less than the avowed adult education activities of the totalitarian states, Germany, Italy and Russia, in which party propaganda for "solidarity" masquerades under the name of adult education.

In the Scandinavian countries including Finland, adult education continues to function with extraordinary effectiveness, though in imminent danger of engulfment by the exigencies of war nearby. Evidence is at hand that the Chinese mass movement for literacy has proceeded effectively in those portions of the country not occupied by Japan. In Japan itself, the necessities of a war program have cut down both the funds and the time formerly devoted to a growing adult education movement. In India, steady progress in the fields of health education and literacy is reported, although the enormous size of the problem indicates that only the surface has been scratched. Some advances are also noted in South Africa, though little has been done for the native populations.

In the British Commonwealth of Nations, adult education expanded and improved during the year, although the effect of the war declarations undoubtedly will be to reduce the emphasis and perhaps to suspend many of the activities. In England the British Institute of Adult Education has served as consultant for a number of social organizations planning their programs. A study has been made of social settlements, the result of which will be to place these agencies definitely in the educational field. In cooperation with the American Association for Adult Education, the British Institute is participating in an international study of radio listening groups. A correspondence instruction service for British sailors has been devised under the attractive title of the "College of the Sea." Australia is in the process of setting up a system of agricultural extension similar to that of the United States. The war may well accelerate this movement. The Australian Workers' Educational Association has established a flourishing system of discussion groups for working men and their families. In Canada, a well organized adult education movement,

under the leadership of the Canadian Association for Adult Education, has made itself a potent force in each of the nine Provinces of the Dominion.

In the United States, the movement has redoubled its efforts to protect the freedom of adult education institutions in a difficult time of official neutrality. The American association has brought to a pause its series of studies on the social significance of adult education, a score of volumes having been issued with some seven or eight remaining to complete the series. The Congress failed to pass legislation introduced for a Federal subsidy to adult education. Curtailments in the amount spent by the Government for relief have induced severe cuts in the program of the adult education division of the Works Progress Administration. Certain of this work has been absorbed by the local school systems, but on the whole the Government action has resulted in a diminution of the amount of free public adult education. Correspondingly, the demands made on the private voluntary agencies have increased. A steady growth in the number of adult education councils is noted, together with an increase in the number of regional conferences sponsored by the national association. Adult education sessions are included now in most of the convention programs of national organizations whose work includes educational activity. A first conference on Adult Education and the Negro, held at Hampton institute, has resulted in increased activity among members of this race. Educators, librarians, and publishers are concentrating on problems surrounding the preparation and distribution of simple, readable materials for adult instructional purposes. The first large scale effort of this nature made its appearance in 1939 under the name of the Peoples' Library. Volumes in this series were prepared in the Readability Laboratory at Teachers college, under the sponsorship of a committee of the American association.

Education, Elementary.

The most significant present trend in elementary education is the growing tendency to view education as a social process. This emphasis is not simply a stress upon education for social purposes, nor is it merely a recognition of the contribution of the culture to individual development. It is not merely the relation of school to community. Rather it is all of these combined against the background of a philosophy which emphasizes the integral character of life, education, and society. It is only as one sees all phases of education in relation to this integration that the significance of the movement becomes apparent.

For example, education for citizenship is no new emphasis. But as it has been conceived in the past, education for citizenship is one thing and citizenship itself is another. Under the emerging trend this dualism is eliminated. The child is a citizen now. His education is the practice of good citizenship. It is life itself. Thus the criteria for activities educational are the criteria for the good life. We can have no effective education for citizenship without opportunity to practice that citizenship now. In fact, we secure no meaningful education at all unless citizenship is involved or is practiced.

Similarly it is not new to emphasize the contribution of the racial heritage to the educative process. It is in fact very old. Moreover, it is to a misconception of this contribution that many educational ills can be traced. Older concepts of education held the mastery of the racial heritage to be the aim of education. In the present trend the aim is individual and social development with the culture in the position of a means. If the individual is subordinated to the culture, enslavement ensues and creative potentialities are destroyed. Simultaneously uniqueness

and individuality flower through vital interaction between a developing personality and the culture. There is thus no conflict between the aims of individual development and the contributions of the culture when they are viewed in the integral relationship here assumed.

Also the artificiality characteristic of school and community relationships disappears in the new school. Here is no thought of selling the school to the community; nor of school domination by the community. The school is not using the community merely as a tool or device, nor does the school lend itself to this or that design on the part of the community. Individual growth and community development are merely different phases of an integral process.

Conceived in the above terms the elementary school avoids the sterility of the old school. Simultaneously it finds an appropriate place for the three R's, for knowledge and skill. Such knowledges and skills are important in the degree to which they increase the individual's potentialities for individual growth and social effectiveness. When the three R's are so viewed they are secondary rather than primary, means rather than ends. Since, however, they are important instrumentalities they are not overlooked.

The present tendency to view education as a social process is bringing more realism into school life. Pupils are studying their communities, participating here and now in the improvement of life both within the school and in the larger community. Since the life of the school is so important it is being subjected to careful scrutiny with regard to teacher-pupil relationships, and its fidelity to the American way of life. Similarly the community life comes in for careful analysis as it impinges upon educational problems and activities. Finally the administrative structure is being examined critically both as to its underlying philosophy and its practical operation in order that it may become an agency which furthers rather than hinders the educative process.

The present emphasis upon education as a social process holds the promise of giving us an elementary school with a balanced emphasis and marked effectiveness both for social and individual growth.

(E. O. M.)

Great Britain.—It is the non-spectacular and detailed work of the schools which constitute their most important contribution to national life. As the President of the Board of Education has stated: "There is no sphere of our national life in which greater changes have taken place during the last ten years than in education, and I can think of none other in which the actual change has been less realized by the average member of the public."

These changes comprise a wider choice of activities, more varied methods of teaching, a greater care of health and a better sense of community needs. And because of these things the cost of education rises though the number of school children diminishes. The average cost per head is now £16.17s.1d., an increase of 10s.

The campaign for improving national health continued during 1939. The estimates included £1,000,000 for free meals, an increase of £250,000; £1,000,000 was provided for the erection of 50 country camps, each to accommodate about 350 pupils; the National Fitness Council expended upwards of £1,500,000 on various schemes, and school buildings of lighter construction are now approved for loans for periods from 30 to 40 years, thus reducing annual redemption charges and avoiding the future burden of out-of-date buildings. One result of this health service was seen in the fact that of the militiamen called up for compulsory training only 2.6% were totally unfit, and 83% were completely fit. Yet deficiencies are still serious: inquiries into malnutrition show that 11% of school children are either "slightly sub-normal" or "bad," and a Ministry of Health Report on Health Services in Wales described some of the schools in terms as lurid as those used two or three generations ago. Seven hundred and ninety-seven ele-

mentary schools have still deficient premises.

The war brought speedy changes. The raising of the school-leaving age to 15, due three years after the Act of 1936, has been suspended, and thus a reform urged for over 20 years has perished at the moment of its realization. Over 1,000,000 school children were evacuated from vulnerable to safe areas with remarkable speed and efficiency, but at least 750,000 remained in the cities, where schools can only be re-opened when they have satisfactory air-raid shelters.

The situation, deplorable as it is for many children, has produced some interesting experiments. Home teaching of small groups by peripatetic teachers, the organization of independent study, and the improvisation of classes by the clergy and voluntary workers have met with a ready response. The claim is general that if there is less teaching there is more learning. And for children evacuated to the countryside there are the gains of a new environment and healthier conditions. In one instance boys showed an average increase in weight in one month of 2½lb. and girls of 3½ pounds.

Education, Progressive. Progressive education has markedly influenced American educational theory and practice toward broadening the concept of the role of the school from one of primarily training children in the three R's to one of considering the whole development of the child as an individual and as a member of society. This concept lays increased emphasis on the fine arts and other forms of self-expression, on mental hygiene and family relationships, and on a study of our changing civilization and the part each member of a democratic society must play in guiding that change. While the spirit and ideas of progressive education have affected schools generally, the organized movement is represented by the Progressive Education Association.

This association, which is the United States section of the New Education Fellowship, had a membership in Aug. 1939, of 9,711. During the year 1939 it held a national conference in Detroit, attended by 4,500 persons, and 28 regional conferences in various parts of the United States and Canada, attended by 29,600 persons. The association has fostered scientific research and the preparation of curricular materials through its various national commissions and committees. The work of the Commission on Secondary School Curriculum, begun in 1932, reached completion in 1939. This commission has been responsible for the following publications: *Teaching Creative Writing* (Laurence H. Conrad); *Science in General Education*; *Reorganizing Secondary Education*; *Language in General Education*. Additional publications of the association were, during 1939, *Catalogue* and 26 *Study Guides for Films of the Commission on Human Relations*; and *Summer Workshops in Secondary Education* (W. Carson Ryan and Ralph Tyler).

The association last year assimilated, as a commission, the John Dewey Society, which publishes yearbooks on the relation of social change to education, and it also took over and reorganized the magazine, *Social Frontiers*, now called *Frontiers of Democracy*, and edited by William H. Kilpatrick, a monthly journal on social, economic, and political problems which bear upon education.

This journal supplements the official monthly magazine of the association, *Progressive Education* (edited by W. Carson Ryan) which deals with new movements in education, educational philosophy and classroom practice.

During 1939 the association sponsored ten "workshops" in educational institutions over the United States. These consisted

of six-week gatherings where specialists in child development, mental hygiene, curriculum, and evaluation, were available to the 1,000 teachers enrolled, to help them work out courses, methods, and materials. The Progressive Education Association in 1939 joined with the National Education Association in establishing a commission to study the ways in which schools can help to develop the human and material resources of their regions.

Education, Secondary. War and threat of war have had marked influence on secondary education in Europe and Asia in 1939 and have not been without effect in the Americas. In some areas there has been widespread dislocation of civilian pursuits as a result of hostilities, evacuation, or change of sovereignty. The result has been the interruption of some trends in secondary education and accentuation of others. A reviewer of a recent book on education in Czechoslovakia makes the comment: "It is to be feared that within a very few years much of the material in this book will seem like ancient history." Both France and England have projected notable reforms in secondary education, providing for a higher "leaving age," closer articulation with elementary and higher schools, some weakening of class distinction among types of secondary school, increased Federal support, and a more unified plan of teacher preparation. Some of the proposed reforms were initiated in France under laws passed in 1938. In Great Britain the report of the Consultative Committee on Education—the "Spens Report"—was presented to the Board of Education early in 1939. There seems little likelihood that its significant recommendations will receive serious attention before the close of hostilities. In neutral countries the economic dislocation attendant upon the war has already affected education budgets and has retarded or suspended planned reforms. The emphasis on national characteristics and development of attitudes appropriate to the support of national policies is unabated or has increased. This tendency is, naturally, more pronounced in the totalitarian states. "Totalitarian regimes . . . are out not only to control every manifestation of national life, but also to change man himself. . . . In all totalitarian countries education in the broadest sense of the word has become the chief tool for the accomplishment of these ends." Consideration of secondary education in these countries must include organizations not technically part of the school system—in Italy, the Balilla; in Germany, the Hitler Jugend and the Dienst-Arbeits; in Russia, the Young Pioneers.

In practically all countries there has been a growing recognition of the need for equivalent opportunity for youth in rural areas and for secondary education adapted to rural life. The excellent 1938 yearbook of the International Institute presents the developments in the various countries. Developments for the year in the United States, in the main, continued already discernible trends. Attacks on problems of curriculum by State and regional organizations continued, with selected secondary schools in California, Michigan, Ohio, and the Southern Association of Colleges and Secondary Schools given freedom and encouragement to experiment with revised curriculums.

Increased attention has been given to the use of radio and motion pictures in the school and to planned excursions. Closer co-operation of the school with its community has been stressed, both in interpretation of the educational program and in definite participation of the school in community improvement. There is a growing awareness of the responsibility of the secondary school toward all youth, illustrated in the effort to hold in school pupils who would ordinarily drop out, and in conscious co-operation with

other agencies ministering to the needs of youth—the NYA, the CCC, and the rapidly expanding adult education movement. A special phase of this responsibility has been recognized in the organization of guidance for pupils of secondary school age. A broadened concept of guidance involves conscious participation of a larger proportion of the teaching personnel.

The wave of economy in State and Federal expenditures has been particularly pronounced in its impact on school budgets and has prevented carrying out reforms the desirability of which has been generally recognized. Limitation by constitutional amendment of tax on real estate and failure to provide alternative sources of revenue have accentuated the problem in some States. This situation was dramatically signalized by closure of the schools of Toledo, Ohio, for two months near the close of 1939.

The year has seen publication of committee reports with significant implications for secondary education. The President's Advisory Committee on Education presents recommendations for legislation which would provide greatly increased Federal support of education with a view to reducing inequalities in educational opportunity, while leaving the determination of educational policies to the several States. The Regents' Inquiry into the Character and Cost of Public Education in the State of New York, published in eleven volumes, presented findings in various areas of the educational program. The volume dealing with secondary education raised serious doubts as to the efficiency of the traditional secondary school in achieving either vocational fitness or social competence. The Carnegie Foundation for the Advancement of Teaching published in 1938 a report on a ten-year study of secondary education in Pennsylvania. This served to point out the notable differences in individual ability of secondary school pupils and the wide disparity of achievement among the secondary schools of the State. Publications of the Educational Policies Commission focus attention on the principles basic to "education for American democracy," and the General Report of the Co-operative Study of Secondary School Standards, appearing in September, culminated seven years of study.

With the assumption of enlarged responsibilities and the dependence on outmoded forms of taxation, the problem of financing secondary education has assumed major importance. Through emergency grants, the Federal Government has contributed to costs of school building construction. It is generally recognized that further Federal aid and reorganization of State and local tax structures will be necessary to provide equal educational opportunities to children in rural districts, and to those of less prosperous States.

Education, Vocational, has continued to expand in the United States during 1939, in enrollment of students as well as in extent and diversity of courses. Federal funds available under the George-Deen Act have continued to stimulate vocational education in agriculture, home economics, trades and industry, and distributive occupations. Some local budget retrenchments have temporarily curtailed certain aspects of the vocational school program, particularly evening classes, but in general there has been definite growth.

For many years the emphasis of industrial education has been on

the preparation of persons for the skilled trades. This emphasis is continuing, but it is worthy of note that more attention is being given to educational service for preparing the lesser intellectual youth for entrance into semi-skilled occupations, and the development of technical education programs of less than college level. National defence needs have received considerable attention during the year 1939. Definite shortages of skilled workers in the metal trades, and the rapid expansion of aircraft manufacturing, have been of concern to industrial educators. It is significant that at least one industrial school is operating an all-night shift in training workers for the machine industries. There appears to be considerable activity in the development of plant training programs for breaking in new workers.

Co-operative efforts by various governmental agencies concerned with the planning and carrying out of vocational education programs seem to have taken on increased significance during the past year. Conferences of representatives of the American Vocational Association and the National Youth Administration have worked toward mutual understanding of problems and joint planning of programs. Similar conferences were held by the representatives of the Agricultural Extension Service and the public educational authorities dealing with agriculture and home economics. These co-operative efforts seem to indicate a desire to avoid unnecessary duplication of service.

Vocational training for out-of-school unemployed youth has received considerable attention. Recent studies of the youth situation have revealed a problem of the first magnitude, and vocational educators have begun to realize the necessity for a large expansion of educational services for unemployed young persons. Co-operative efforts of the NYA and the public schools have been partially meeting this need, and the CCC has provided some training for its enrollees.

The induction of young persons into employment seems to be receiving more attention in the fields of industrial and agricultural education. School officials appear to be more concerned about vocational guidance needs, and to realize the necessity of carrying through with students until they are satisfactorily placed on jobs and are adjusted to work life.

Organized labour appears to be taking a more active interest in vocational education in the public schools, and labour relations are receiving more attention in industrial education programs. Interest in the development of apprentice training seems to be growing, although its growth has been retarded somewhat by certain provisions of the Federal Wages and Hours Act.

Continuing interest in the recent reports of the Regents' Inquiry in New York State and the President's Advisory Committee on Education is noted. Soon after the appearance of these studies, there was considerable criticism from vocational educators with respect to certain findings and recommendations. Careful study of these reports seems to indicate that unfortunate use of terminology had caused misunderstanding, and recently the criticism appears to be less caustic.

(L. A. E.)

British Isles.—The publication of the Spens Report heralded a wider conception of technical training as a factor in social progress. The main recommendation was that there be established in Great Britain new post-primary schools known as "Technical High Schools," similar to those established in New Zealand. The duties of these schools would be (1) to provide a good intellectual discipline apart from its technical value, and (2) to have a technical value in relation not to a single occupation, but to a group of occupations. The curriculum provides a liberal education "with science and its applications as the core and inspiration." The academic is no longer to be ranked as superior to the technical, nor intellectual growth to be nourished on dead subjects docketed and classified in text-books. In commercial education,

lacking the help of experts, the Spens committee failed to find a unifying principle.

The number of full-time students attending technical institutions in England and Wales in 1939 was 42,763, as compared with 40,016; and the number of part-time students 1,281,766—an increase of 137,386. Mr. Kenneth Lindsay, parliamentary secretary to the Board of Education, referred to these part-time students as "the cream of the whole educational system." He also stated that 16,000 boys were undergoing technical training in the armed forces. In Scotland, the enrolment of 161,938 students in continuation classes showed a substantial increase, and opportunities for advanced studies were greatly developed. In Eire a vocational commission was appointed to investigate the practicability of developing functional or vocational organizations.

British Dominions and Colonies Overseas.—Attempts were made everywhere to improve technical training and to avoid the error of placing "unhealthy and exaggerated emphasis" on the academic type of school.

Eggs. Prices of eggs in the United States advanced in early Sept. 1939 in line with the wartime rise of other commodities, but by the middle of the month price trends reversed and by late November egg futures on the Chicago Mercantile Exchange reached the lowest November price in six years. Increase in farm flocks during 1939 and heavier autumn and early winter egg production, because of mild weather, caused heavier receipts that brought prices down, and speculators who had stored eggs lost heavily. The number of laying birds in farm flocks Nov. 1, 1939 averaged 75.6, the largest for that date since 1930, comparing with an average of 72.5 in 1938 and a ten-year average of 73.8 layers per flock. The average number of pullets under laying age in farm flocks Nov. 1, 1939, was 34.6 compared with 33.8 a year earlier. Receipts of eggs in the four principal markets—New York, Chicago, Philadelphia, and Boston—from January 1 to September 30 in 1939 were reported by the Department of Agriculture as 11,880,961 cases compared to 10,918,408 cases in 1938 (30 dozen eggs to the case). Storage stocks Oct. 1, 1939, were 5,429,000 cases of shell eggs and 121,469,000 lb. of frozen eggs, and 4,765,000 cases of shell eggs and 110,244,000 lb. of frozen eggs on the same date in 1938. On Nov. 1, 1939, the Uner-Barry reports showed 3,528,000 cases of shell eggs in storage, as against 3,244,000 cases in 1938 and a five-year average (1934-38) of 4,292,000 cases. By November 25 storage holdings of shell eggs had declined to 1,929,000 cases, as against 1,853,000 cases on the same date in 1938 and a five-year average of 2,636,000 cases. Dealers who had stored eggs in the spring at 18½¢ a dozen, when the Federal Surplus Commodity Corporation was buying eggs for relief distribution, sold in late November at as low as 15½¢ a dozen, the Surplus Commodity Corporation having withdrawn its support in September. Exports of shell eggs from the United States the first nine months of 1939 were 1,887,380 dozen, compared to 1,603,938 dozen in the same period in 1938.

Exports of eggs from the United States during the World War (1914-18) were not of significant quantity and at the peak never

Imports of Eggs into the U. S., First Nine Months of 1938 and 1939

	1939	1938
Eggs in shell	224,042 doz.	162,411 doz.
Whole eggs, dried	49,500 lb.	137,115 lb.
Whole eggs, frozen	420 lb.	938 lb.
Yolks, dried	447,175 lb.	226,655 lb.
Yolks, frozen	25,330 lb.	430,220 lb.
Egg albumen, dried	387,283 lb.	467,831 lb.

represented more than 2.51% of the egg money received by farmers. (See also POULTRY.) (S. O. R.)

Egypt. Area c. 383,000 sq.mi. (arable land 13,600 sq.mi.); pop. (est. Dec. 31, 1937) 16,030,000. Chief towns (pop. 1937): Cairo (cap., 1,307,422); Alexandria (682,101); Tanta (94,421); Mansura (68,637); Damanhur (61,791); Asyut (59,925). Ruler, King Farouk I; premier, Aly Maher Pasha; language, Arabic; religion, Mohammedan 91%; Copt 7%.

History.—The Liberal-Saadist cabinet under Mohamed Mahmud Pasha, which held office throughout 1938, continued in 1939 until August 12 when Mohamed Mahmud Pasha resigned on grounds of ill-health. Aly Maher Pasha, political adviser to the King, formed the new cabinet on August 18. It was composed of nine Independents and five Saadists, a new portfolio being created for social affairs. The Liberals were dropped because they were dissatisfied with the portfolios offered them. The Saadist leader, Dr. Ahmed Maher Pasha, remained outside, and was eventually elected president of the chamber.

The War.—The outbreak of the war found Egypt well prepared. Ever since Munich the organization of the Egyptian Army had proceeded actively. A new Territorial army had been decreed. Viscount Gort had visited Egypt in February to confer with the Egyptian and British military chiefs. Joint Anglo-Egyptian manoeuvres had been held. An A.R.P. organization had been created in the principal towns. Indian troops had begun to arrive in August and soon after the commencement of hostilities further reinforcements reached Egypt, while British troops were withdrawn from Palestine to reinforce the western desert defences.

In lieu of declaring war Egypt severed her diplomatic relations with Germany in September. All steps necessary for dealing with the German community were taken. The British Government received all the assistance to which the Treaty of Alliance entitled it. A state of siege was declared with the premier as supreme governor.

Military courts and a censorship were instituted and a strict control of supplies and exchange was established. Parliament in special session approved of these measures on October 12.

In September public opinion became exercised over the disposal of the new cotton crop. Egypt could no longer export to Germany, Poland, Czechoslovakia and Austria, who normally took 25% of the total crop or some 1,700,000 cantars. After considerable discussion both in parliament and in the press and protracted negotiations between London and Cairo it was announced on November 17 that the British Government would purchase this quantity.

Other important events during the year were the departure of the heir presumptive, Prince Mohamed Ali, for the Mecca pilgrimage (February 7) the wedding of Princess Fawzieh,

the eldest sister of King Farouk, to the Shahpur of Iran (March 15); the discovery at Tanis, in the Delta of the tomb of one of the Sheshank kings of the 22nd dynasty, mentioned in the Bible; the visits of Dr. Goebbels (April 6) and Marshal Balbo (May 8), the approval by the National Bank of Egypt shareholders of the Egyptian Government's proposal to transform that institution into a Central Bank; the re-establishment of close relations between Turkey and Egypt by the dispatch in June of an Egyptian diplomatic mission under Abdel Fattah Yehia Pasha, minister for foreign affairs. (A. MN.)

Education, 1936-37.—Elementary and secondary: Government schools 4,795; scholars 930,248; high schools: Government 6; scholars 1,123; Fuad I university: scholars 8,150; foreign schools 410; scholars 76,750.

Banking and Finance.—Revenue (est. 1939-40) £E.40,247,000; expenditure (est. 1939-40) £E.41,847,000; public debt (May 1, 1938) £E.95,208,720; reserve from budget surpluses £E.33,062,569; notes in circulation (Aug. 31, 1939) £E.22,200,000; gold reserve £E.6,500,000; exchange rate (£E.1 = 100 piastres): 97½ piastres = £1 sterling.

Trade and Communications.—External trade (merchandise): imports (1938) £E.36,934,373; imports (Jan.-June 1939) £E.16,558,000; exports (1938) £E.29,342,486; exports (Jan.-June 1939) £E.16,470,000; re-exports (1938) £E.782,528. Communications and transport, 1938: roads, main 1,240mi.; secondary 3,430mi.; railways, State 3,537mi.; agricultural 876mi.; shipping 60,495 tons gross; entered ports 35,390,325 tons gross; passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1938): cars 29,382; commercial 4,074; cycles 2,051; wireless receiving set licences (Dec. 31, 1938) 78,823; telephone instruments in use (April 30, 1938) 59,922.

Aerial Navigation (1938)

	Misr Airways Company	Imperial Airways Ltd.	"K.L.M." Royal Dutch Air Lines
Passengers	18,550	6,056	2,450
Freight and baggage (Kg.)	63,828	114,180	45,140
Mails (Kg.)	16,435	1,482,130	131,851
Miles flown	1,011,104	6,067,935	2,795,180
Regularity of service	98.1%	99.9%	98.2%

Agriculture and Minerals.—Production 1938 (in metric tons): cotton, ginned 494,500; maize 1,570,700; wheat 1,250,200, (1939) 1,333,800; rice 725,200; petroleum 225,700; phosphate rock 458,400; cane sugar, refined 209,000; barley 232,700, (1939) 238,200; ground-nuts 15,600. (W. H. WN.)

Eire. Area 26,601 sq.mi.; pop. (est. June 30, 1939) 2,934,000. Chief towns (pop., census 1936): Dublin (capital, est. 1939; 482,300); Cork (80,765); Limerick (41,061); Dun Laoghaire (est. 1939; 40,600); Waterford (27,968). President: Dr. Douglas Hyde (*de h-Ide*); languages: Irish and English; religion: Christian (Roman Catholic 93%).

History.—Following on a pronouncement by the Catholic bishops of Ulster against the extension of conscription to the Six Counties, Eamon de Valera stated on May 2 that he had made strong representations to the British Government, which were effective. Later in the same month he protested against the conscription of citizens of Eire resident in Great Britain.

On the outbreak of war he declared his policy to be one of absolute neutrality, which the German Government, through its minister in Dublin, had promised to respect. A British representative—Sir John Maffey—was sent to Dublin to supplement the existing system of communications.

Following on the establishment of a ministry of supplies, a general cabinet reshuffle was announced on September 10. Mr. de Valera added education to his other departments; Mr. O'Kelly became minister for finance; Mr. Lemass, minister for supplies; Mr. McEntee took over industry and commerce; Mr. Rutledge,

QUEEN FARIDA of Egypt and her daughter, Princess Feriâh

Industrial Production Census in Eire (preliminary figures) 1938

Industry or Trade	Gross output £	Net output £	Persons employed
Boots and shoes	1,743,206	825,984	6,508
Brewing	7,883,959	6,029,090	3,830
Sugar and confectionery	3,431,244	1,102,175	4,741
Bacon curing	6,052,123	850,350	2,381
Shirt making	417,207	185,138	2,097
Hosiery	1,101,211	559,445	4,887
Textiles	2,201,237	804,348	5,937

Vehicles	3,046,039	892,002	3,595

local government; Mr. Boland, justice; Mr. Traynor, defence; Mr. Little, posts and telegraphs; Mr. Derrig, lands; while Dr. Ryan remained in charge of agriculture and Mr. Aiken became minister for the co-ordination of defence.

An Emergency Powers Act (September 2) gave the Government extensive control over all economic activities, powers of arrest and internment, and power to impose censorship. The Army Reserve was mobilized, and a temporary black-out imposed.

On November 18 Mr. O'Kelly in an emergency budget, increased income tax by 1s. and imposed $\frac{3}{4}$ d. per pound on sugar, 2s.8d. per pound on tobacco, 12s. per barrel on beer, and 10s. per gallon on spirits, estimating for an increased revenue of £603,000, to be supplemented by a saving of £400,000 and a new loan of £7,000,000.

On April 1 a Treason Act became law, and on May 31 the Offences Against the State Act gave powers of arrest on suspicion. A proclamation of June 23 suppressing the I.R.A. was followed by numerous arrests and by a series of hunger-strikes. An application on behalf of a prisoner for a writ of habeas corpus was granted, by Justice Gavand Duffy, on December 2, in a judgment which declared the Offences Against the State Act unconstitutional. This led to the release of 58 prisoners, and an appeal to the Supreme Court, which was refused.

On December 23 the Magazine Fort in Phoenix Park, Dublin, was raided by an armed band who occupied it for 3½ hours and carried off 1,250,000 rounds of rifle and machine-gun ammunition. Intense police and military activity had resulted by January 1 in the recovery of about one-third of the amount carried off. Meanwhile the Dáil was specially summoned for January 3 to pass fresh emergency legislation. (M. T.)

Education.—In 1937-38: elementary schools, 5,166; scholars 469,925; secondary schools 336; scholars 36,092; universities: National 4,422 students; Trinity college, Dublin 1,489. (See also EDUCATION: *British Empire*.)

Banking and Finance.—Revenue, ordinary (1938-39) £31,884,000; (est. 1939-40) £32,522,000; expenditure, ordinary (1938-39) £33,110,000; (est. 1939-40) £35,716,000; public debt (March 31, 1939) £44,860,000; notes in circulation (Aug. 12, 1939) £16,058,921; gold bullion (March 31, 1939) £1,991,682; reserve, British bank securities (March 31, 1939) £8,173,000.

Trade and Communication.—Foreign trade (merchandise): imports (1938) £41,414,000; (Jan.-July, 1939) £24,978,000; exports (1938) £23,877,000; (Jan.-July, 1939) £13,242,000; re-exports (1938) £363,000. Communications: roads, main (1937-38) 10,000mi.; secondary 38,000mi.; railways, total track mileage (1938) 2,551mi.; shipping (1938): vessels 594; net tonnage 116,145; motor vehicles licensed (Aug. 1938); private cars 48,599; other vehicles 20,997; wireless receiving set licences (1937-38) 140,487; telephones, installations (1937-38) 26,190.

Agriculture, Manufactures, Mineral Production.—Production 1937, (in metric tons): oats 568,000; wheat 201,300; potatoes 2,500,200; barley 111,900; beet sugar 54,400; coal 120,000; wool 8,100. Agriculture and fisheries, net output (1937) £42,000,000; industry, net output (1937) £39,800,000. Labour 1937-38: number of insured workers, average 433,865; number of unemployed, average 88,714. (W. H. WN.)

Elections. The off-year elections of 1939, turning mainly on local issues, reflected no broad or deep change in the political situation as it was observed in 1938; and few dependable signs or portents appeared to indicate what is going to happen at the polls in 1940.

The Republicans showed unusual strength in the Chicago contest of April, when, although the Democratic incumbent Mayor Edward Joseph Kelly was again elected by a safe majority, the Republican candidate, Dwight Green, received the votes of 638,068 citizens—a larger percentage of the total vote cast than had been given to his party by the city in the presidential elections of 1932 and 1936.

In November the party also made visible headway in the East, extending particularly its legislative control in New Jersey and Pennsylvania; and in Cleveland it re-elected its candidate, Mayor Harold H. Burton, without serious opposition from the disorganized Democrats. But on the whole the balance between the major parties was not definitely shifted from where it stood at the end of 1938.

Within the Democratic fold the trend of developments was no more certain. In the April primaries of Mississippi (consummated by a run-off primary in August) Paul B. Johnson, with the backing of the strongly pro-Roosevelt Senator Bilbo, won the Democratic nomination for Governor over M. S. Conner, whose chief support came from the more conservative followers of Senator Harrison. With similar implication, in San Antonio's spring election, former Representative Maury Maverick, running on a progressive "Fusionist" platform, succeeded in capturing the mayoralty from the regular Democrat Charles Kennon Quin, who had helped to defeat his re-election to the House in the preceding year. Regulars and machine Democrats of New York county, on

THE MIDDLE OF THE ROAD is favoured by most 1940 presidential candidates, observes Ray in *The Kansas City Star*

the other hand, met only an apathetic resistance in November and were consequently able to carry their entire ticket; while in Memphis, Tenn., the redoubtable boss, Edward Crump, easily had himself chosen as mayor for the avowed purpose of resigning on Jan. 1, 1940, and securing the appointment of Representative W. Chandler to fill the office until the next regular election day.

In the August primaries of Kentucky Governor Albert Benjamin (Happy) Chandler scored a victory over Senator Alben Barkley by having his supporter, Lieutenant Governor Keen Johnson, nominated for Governor on the Democratic ticket. Johnson was subsequently elected without great difficulty over the Republican nominee Judge King Swope. But between these two events, on October 9, Chandler resigned from office, turning the governorship over to Johnson immediately; and in turn Johnson appointed him to complete the unexpired senatorial term of the late Marvel Mills Logan.

Radical successes were registered in a small way at Bridgeport, Conn. where the Socialist mayor Jasper McLevy was re-elected for the fourth consecutive time, and in Detroit where Edward Jeffries, actively supported by C.I.O., managed in a non-partisan contest to unseat Mayor Richard W. Reading, who had won the last election partly on the strength of his opposition to C.I.O. and to radicalism.

Of more general interest than these scattered local elections was the defeat in two areas of the movement for greater old age pensions. In California the proposed "Ham and Eggs" amendment, providing for payments of \$30 a week in scrip to the "senior unemployed," was strenuously opposed by Governor Olson and by Dr. Townsend, the well known exponent of generous pensions. The plan was defeated by a vote of approximately 2 to 1. In Ohio at the same time the less fanciful "Bigelow Plan" for pensions in regular currency of \$50 to single persons and \$80 to couples over 60 was rejected by a vote of more than 3 to 1.

Schedule of Elections.—Presidential elections in the United States are uniformly held on the Tuesday after the first Monday in November in years designated by multiples of four. Congressional elections are held on the same or corresponding day in even years by all States except Maine, which adheres to its old custom of holding elections on the second Monday in September. Governors are elected in even years on the same day as members of Congress in 22 States: Arizona, Arkansas, Colorado, Connecticut, Georgia, Idaho, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, North Dakota, Ohio, Rhode Island, South Dakota, Tennessee, Texas, Vermont and Wisconsin. They are elected quadrennially at the same time as the president in 10 States: Delaware, Florida, Illinois, Indiana, Missouri, Montana, North Carolina, Utah, Washington and West Virginia; quadrennially at the congressional elections between presidential years in 10 States: Alabama, California, Maryland, Nevada, New York, Oklahoma, Oregon, Pennsylvania, South Carolina and Wyoming; quadrennially on the corresponding day in the years immediately preceding presidential elections in 2 States: Kentucky and Mississippi; quadrennially on the corresponding day in the years immediately following presidential elections in 1 State: Virginia; triennially on the corresponding day (latest election Nov. 2, 1937) in 1 State: New Jersey. Louisiana chooses its governor quadrennially in presidential years on the third Thursday in April; and Maine, biennially at the same time as she selects her Congressmen. (See also DEMOCRATIC PARTY; REPUBLICAN PARTY.) For elections in other countries see under the name of the country.

(G. P. BA.)

Electoral Vote. Following the census of 1910 the membership of the House was fixed at 435 and it has remained at that number since then, thus with the 96 sena-

"NOW THERE'S TWO OF 'EM," the riddle of the sphinxes, by Russell of *The Los Angeles Times*. Roosevelt did not clarify his presidential intentions in 1939, but Garner announced his candidacy December 16

tors, making the total 531. Under the reapportionment of 1932 the distribution of the electors among the States was changed because of changes in population. Eleven States gained one or more representatives in Congress and thus gained electoral votes, and 21 lost a representative thus losing an electoral vote. This apportionment became effective in the presidential election of 1932 and it will be effective in 1940.

(G. W. Do.)

Electrical Industries. Output of electricity took the sharpest rise on record in 1939, just as in 1938 it took the sharpest dip. The two years together are an example of the economic buoyancy of the electric utility business. The 1939 output was 123,000,000,000 kw.hr., an increase of some 13% over 1938 and some 7% over 1937, the previous record year. In addition, 5,300,000,000 kw.hr. were purchased, some from Canada (a quarter), some from Government hydro plants, and some from inter-connected industry. During 1939 1,285,000kw. of new generating capacity was added, bringing the total up to 37,500,000 kilowatts. In ten years capacity has increased 26.8%, while output has gone up 36.4 per cent. The growth of load was so unusually swift during the last half of 1939 that commitments were made for new capacity in excess of anything in the last ten years. The 1940 program calls for 2,000,000kw. additional capacity and it is possible that 1941 steam capacity additions might hit a new all-time high.

Sales of electricity exceeded a hundred billion kilowatt hours in 1939 for the first time. Industrial usage due to the business up-

turn which was further stimulated by the European war was responsible for the greatest growth. Revenues increased 6% to \$2,304,000,000. Expenses were \$1,025,000,000, including the tax bill of \$345,000,000. Approximately 900,000 new customers were added during the year, bringing the total up to 28,750,000.

Although financing involved a total of \$992,000,000 in 1939, the new capital with the exception of the two bottom years of the depression was the lowest ever. It amounted to but \$16,000,000. The yield on utility bonds hit a new low, some issues going below 3% to maturity. Improved business was responsible for the largest construction budget in 1940 in the past ten years. It is \$605,000,000. Electrical manufacturers felt the good business conditions. Production was up 25% to \$2,143,000,000. This was still below 1937. By the end of 1939 REA had allotted \$267,000,000 to 687 systems. Of these 488 had been energized and had 400,000 consumers. Construction accounted for 180,000 mi. of lines, costs of which had been reduced to \$754 per mile.

Government hydro projects added 488,450 kw. in 1939, bringing the total in operation to 1,418,000 kw. out of an ultimate capacity of 6,762,000 kilowatts. Capacity to be added in 1940 will be approximately the same as for 1939. Because of the European war statistics on foreign operations have not been available.

Considerable spurt was given to higher-pressure, higher-temperature turbine and boiler installations during the year. Circuit breakers swung noticeably toward oilless designs. Industrial plants reflected a strong trend toward metal-clad switchgear. Late in 1939 a movement to standardize upon a universal interchangeable arrangement of distribution transformers as to tank, mounting, terminals, and bushings was nearing fruition. Use of capacitors was quickened both by the power industry and industrial plants to secure the ultimate capacity out of distribution facilities.

Reliance upon wood for impulse insulation gathered momentum as an adjunct to superior proofing of transmission lines against lightning, and with this went installation of expulsion tubes and gaps as well as extensive counterpoise installations. More intensive studies of grounding were also common.

High-voltage d.c. transmission received a boost from the late J. D. Ross of Bonneville as a means for bringing Columbia river power to the East. It was demonstrated, however, at A.I.E.E. meeting that d.c. is not a competitor of a.c. for long distances.

Two new radio channels were opened by FCC to utilities—2,292 and 4,637.5 kilocycles. Fluorescent lighting was pushed ahead by the New York and San Francisco fairs. More than 1,000,000 tubes had been produced by the end of the year, with 36-in. and 48-in. predominating. Two State commissions, Kentucky and Oklahoma, ruled against low power factor. The momentum of incandescent sales, however, continues. Nearly 1,000,000,000 were produced in 1939.

Some far-reaching legal decisions came down during the year, the most important being that of the 14 utilities *v.* TVA, in which it was held by the United States Supreme Court that utilities had no monopoly and that competition, whether by Government or private utility, was legal, that TVA operations were not illegal Government regulation and that sales of Government property in competition with others is not unconstitutional.

The same court in the Edison Light & Power case by upholding *Smyth v. Ames* declined to accept the prudent investment theory.

FPC was refused jurisdiction by the Appellate Court over hydro development that does not involve navigation.

The loss of taxes to State and local governments when public power succeeds private ownership stirred up action in several places. Alabama and Georgia produced bills restoring to their Government units all tax revenues lost when private power was taken over. Tennessee taxpayers started a campaign to secure from TVA enough to cover tax losses resulting from sale of pri-

vate utilities. The matter will be brought up in Congress in 1940.

Elections on municipal ownership were especially quiet in 1939. What few cases were up went almost all against public ownership. This situation reflects the stoppage of Government subsidies for this purpose.

Little came of the filing of integration intention in December, 1938. Reorganizations and widespread change in personnel resulted in little activity until late in 1939, when it was stated that the commission was ready to go ahead with enforcement of the law. The most startling action of the commission was to deny Consumers Power permission to sell new mortgage securities, but insisted that the money come from the sale of common stock.

The National Defense Power Committee was dissolved and the work taken over by the National Power Policy Committee. Its principal effort has been to secure acceptance of the grid plan for which the Government would appropriate several hundred million dollars.

There was little attack by the Administration during the year. The President declared that the Government would not extend its power development program, although negotiations have been under way with Canada over the St. Lawrence seaway.

The most important event of the year in the public power field was the settlement of the TVA controversy whereby Tennessee Electric Power and Memphis Power & Light sold out to TVA and cities in the system. In addition TVA purchased other properties in Tennessee and Mississippi. Government projects also purchased some private properties in Texas, Nebraska, and Oregon.

While the Government appears to be starting no new hydro projects, State authorities are springing up in Arkansas, New York, Illinois, and elsewhere. Outside of the purchase of the Tennessee properties TVA's achievement of the year was receiving a clean bill of health from the Congressional investigating committee. Greater evidence of desire of public power to dispose of its energy over private lines was shown in contracts in Georgia, Alabama, Texas, Nebraska, and Oregon.

Electric Lighting. Light Sources.—Tungsten coiled filament lamps, with the majority of bulbs containing an inert atmosphere averaging 90% argon and 10% nitrogen gas, still constitute the chief illuminants throughout the world. Lamp consumption in the United States in 1939 was approximately 785,000,000 units of which 535,000,000 were large lamps, the remainder, miniature types. This total exceeds the previous year's use by some 10%. General quality improvements included the double coiling of filaments to reduce effective heat radiation surface; higher gas pressures, and a tendency toward smaller bulb sizes in North America, plus extending uses of krypton gas by European manufacturers. New filament types included the aluminized interior neck coatings on paraboloidal bulbs or reflector lamps in 150 and 300 watt sizes, together with coloured glass lenses that adapt these lamps chiefly for show window lighting. Side silvered tubular showcase lamps advanced in 25 and 40 watt sizes, and bowl-silvered indirect lighting lamps grew in popularity.

World-wide Electric Consumption*

Canada	2454
Norway	2760

*Includes about 40% for lighting.

A MIDGET MERCURY VAPOUR LAMP, developed in 1936-39 by Cornelis Bol of Stanford university, can clearly illumine an automobile at 500 feet. The lamp's diameter is only 2/25 of an inch

The average size of filament lamp sold in the United States was 62 watts, the average lumen output approximating 890. The assortment of six-hour-life photoflood lamps expanded for coloured motion pictures and several new wire photoflash lamps appeared with longer duration of flash, chiefly for press photography. For more powerful projection, especially of coloured light, there was introduced the 2,500 watt, 65 volt concentrated filament lamp.

Tungsten filament lamps designed to emit chiefly sub-visible infra-red radiation at 1,200 Angstroms were offered in 150 watt and 250 watt sizes in the reflector bulb, and up to 1,000 watts with the medium bipost base. Such lamps found increasing possibilities in connection with many drying operations of lacquers, paints, glued labels, and for spot heating. Heavy tungsten coils in heat resisting glass bulbs were developed in 1,000 and 2,000 watt sizes for the purpose of generating steam and vapourizing liquids. The "sealed beam" or large evacuated reflector lamp for automobile headlight service was standardized in the United States, giving the motorist better road lighting with reduced glare, and a device free from ordinary deterioration. Yellow headlamps were still favoured in Europe.

About 1,000,000 commercial fluorescent tubular lamps were sold, of which the rated life increased from 1,500 to 2,000 hours. Improvements in coatings increased the light output from 20% to 50% over the records of the introductory year of 1938. A bluer white colour was added to the former seven tints represented by an increase in the equivalent colour temperature from 2,800°K to 3,500°K; also a four-foot length of tube was added together with a six-inch, four watt, and a nine-inch six watt instrument type of flattened fluorescent lamp. The automatic glow relay control was developed to give instantaneous restarting of fluorescent lamps. True colour discrimination caused approximately half of the demand to be for the daylight white lamps. Some fluorescent lamp installations appeared in Western Europe and elsewhere, but high voltage mercury and neon filled tubing with fluorescent coatings still remained much in evidence in Western Europe. For decorative and special forms, chiefly electrical advertising, these latter illuminants were extensively employed in North American and some South American countries. Electric discharge or metallic vapour lamps continue to expand gradually, chiefly the 10,000 lumen sodium vapour lamp applied to areas of traffic concentration or dangerous roadways, docks and piers, while the high intensity quartz capillary mercury lamps extended for suburban street lighting were most popular in Western Europe.

Lighting Applications.—Black-outs or air raid precautions in European capitals led to street lighting recommendations on the order of 1% of moonlight (·0002 ft.-cs.) and gave incentive to the use of fluorescent paints and of screened mercury vapour lamps emitting practically no visible but considerable long-wave ultra-violet energies for excitation. The San Francisco Exposition demonstrated colour harmonies with fluorescent and mercury lamps, while the New York World's Fair incited interest in mercury and filament lighting of waterfalls and massive fountain sprays; the wide variety of usage of fluorescent lamps both high and low voltage; the application of translucent plastics in advertising signs, and black light in fluorescence. The 10th meeting of the International Commission on Illumination in Holland led to further inter-country lighting standardization, and recorded desirability of higher illumination intensities. Electric Power Generation. Electrical energy is obtained in the conventional manner from fuel and water power resources. Most of the available water power sites which are economically important from the standpoint of electric power production and disposition alone have been developed. The majority of the hydro-electric developments that are being undertaken at the present time are justified economically for the production of electrical energy only when considered in connection with irrigation, flood control, and navigation, or a combination of these factors. Undertakings of such broad scope are necessarily of a public nature and consequently have been carried on as complete or partial public or governmental enterprises.

The most recent hydro-electric projects of this type are Boulder and Parker dams on the Colorado river; Bonneville and Grand Coulee dams on the Columbia river; Norris, Gunterville, Pickwick, Chickamauga and Hiwassee dams on the Tennessee river and its tributaries; Shasta, Grand river, Santee Cooper, Fort Peck, Lower Colorado on other important rivers. Water wheel driven generators with a total aggregate capacity of approximately 2,500,000kw. are either in service or under construction for these projects. Additional projects are now under consideration.

Although the amount of electrical energy obtained from hydro-electric generating stations is relatively large, the greater portion is produced from steam driven prime-movers in fuel-fired generating stations. The steam turbine has completely supplanted the steam driven reciprocating engine as the prime-mover for driving electric generators. Most of the steam driven turbines in op-

eration at the present time have been designed to utilize steam at moderate temperatures and pressures. Large increases in the output and radical improvements in efficiency of steam turbines have been obtained by materially increasing the temperature and pressure of the inlet steam. Inlet steam pressures and temperatures of 1,200 lb. per sq. in. and 950° F. respectively are used quite generally for most of the steam turbines now going into service. A few projects are under construction using inlet pressures as high as 2,400 lb. per square inch. These increased pressure and temperature requirements have made it desirable and essential that highest possible rotational speeds be used to keep the weights and dimensions of the stator and rotor elements as small as possible.

The use of higher temperatures and pressures has greatly increased the range of capacities of the higher speed units into the field formerly held by 1,800 r.p.m. units or even of 1,200 r.p.m. units.

The two principal items of progress in turbine generators during the past few years are (a) the development of the 2-pole, 3,600 r.p.m. unit for ratings required by the Central Station industry, and (b) the application of hydrogen as the cooling medium.

A material increase in the output of the 2-pole generator has been obtained from the summation of several incremental increases resulting from improved mechanical, electrical, thermal, and magnetic properties of materials, more effective ventilation and improved design proportions and better utilization of materials. When using the best materials and design proportions available, it is possible to build the 2-pole, 60-cycle generators with air cooling for ratings up to 50,000 kilovolt-amperes. The most economical range of ratings for air cooled, 3,600 r.p.m., 60-cycle generators is from 500 to 25,000 kilovolt-amperes. During the years 1938-39, approximately 750,000 kva. capacity of 3,600 r.p.m. generators ranging in rating from 20,000 to 50,000 kva. have been placed in service.

The additional output rating of the 2-pole, 60-cycle generator was obtained by using hydrogen as the cooling medium. As compared to air, hydrogen has a density of 7%, heat transfer coefficient of 135%, thermal conductivity of 700%, and specific heat of approximately 100%. With these properties, the use of hydrogen as the cooling gas makes it possible to obtain an increase in rating of approximately 15% over that obtainable with air cooling, on the basis of maintaining given rating and performance characteristics. Since the windage-friction and ventilation losses are directly proportional to the density of the cooling gas, they are practically eliminated when hydrogen is used as the coolant. The increase in efficiency is on the order of 0.6 to 0.9%, depending on the rating. A similar increase in rating and improvement in efficiency performance without any explosion hazard can be obtained by using helium as the cooling gas. At the present time, however, the use of helium gas for this application is less desirable on account of its higher cost.

The advantages of hydrogen as a cooling medium for turbine generators are:

- (1) Reduced windage, friction, and ventilating losses, because of the low density of the hydrogen gas. The ventilating losses are proportional to the gas density. Full load efficiency of the generator may be 0.6% or more higher than for the corresponding air cooled machine.
- (2) Increased output per unit volume of active material, because of the high heat storage capacity, thermal conductivity and heat transfer coefficients of hydrogen. This advantage of hydrogen cooling makes it possible to build turbine generators for higher ratings than are possible with air cooling.
- (3) Reduced maintenance expense, because of the freedom from dirt and moisture.
- (4) Increased life of the insulation on the stator winding, because of the absence of oxygen and moisture in the presence of corona.
- (5) Reduced windage noise, because of the low density of the gas.

LIGHTNING which strikes transmission lines is by-passed to the ground by de-ion gaps on a self-protected transformer, demonstrated in 1939 with artificial bolts

Approximately 2,250,000 kva. of hydrogen cooled turbine generators were either in service or in manufacture in 1939.

The fuel oil type of internal combustion engine has been developed rapidly during the past few years and is now a reliable and economical prime-mover for slower speed generators of ratings up to 2,000 kva. capacity. The applications of generating units of this type are for auxiliary power on ships, small generating stations and mobile power plants. (See also WATER POWER.)

(C. M. LA.)

Electric Transmission and Distribution.

In the Pacific Northwest section of the United States a power development of tremendous proportions was under way in 1939. Construction is in progress on high-tension transmission lines of various lengths tying together the Bonneville and the Grand Coulee power stations and the several substations of the system. Studies and plans are being made with the expectation that these Government projects will be interconnected with the private and municipal enterprises of the region to form a high-voltage network or grid. The engineering studies associated with this project are so extensive that a network analyzer (miniature power system) was purchased in 1939 to aid in the solution of the network problems which will be constantly

arising. It appears possible that the first long direct-current transmission line in the U.S.A. may be built as a part of this system.

A new single-circuit line to operate in conjunction with the original 266-mi. double-circuit Boulder Dam Line was under construction and is scheduled to be put into operation early in 1940. Every available technical consideration has been incorporated in the design and operation of these lines and their associated stations to give them a high degree of reliability because they form a major source for the system into which they deliver power. Another single-circuit line, 233mi. in length and operating at 220 kilovolts, was put into service in July 1939. This line runs from Boulder dam to Chino, Calif., substation of the Southern California Edison Company, and is to be extended 27mi. to Barre substation, now under construction near Stanton. In contrast with the other lines, this newest line is of less expensive construction and, although provided with ground-fault neutralizers (Petersen coils) to suppress line-to-ground faults, can be put out of service temporarily by line-to-line faults. These interruptions can be tolerated in this case because of the adequacy of the other hase stations of the Southern California Edison system.

In the U.S.S.R. the carefully planned program of power development and utilization has materialized phenomenally during the past ten years. High-voltage transmission is standardized at 110 and 220 kilovolts and the new equipment is getting to be more largely of Soviet manufacture. A very high proportion of the power transmitted is used in industry and an increasing proportion in agriculture. The general plan has been the development of centres of power production, and the more recent development of the plan has been the integration of these centres into an interconnected unitary system.

The 220-kilovolt cable line in Paris, the 132-kilovolt lines in New York and Chicago, and the 125-kilovolt line in Germany have continued their satisfactory operation and four 150-kilovolt mono-phase cables (one standhy) have been installed between Rotterdam and The Hague.

Notable advances have recently been made in reducing the cost of the production and distribution of electric power. These economies begin at the power house where topping, or superimposed, turbines utilizing steam at high pressures have made possible the production of 25% to 50% more power with the same fuel consumption. The newer and more efficient stations and their associated transmission facilities are operated at high load factors and close to unity power factor, with the less efficient stations taking up the peak increments and the reactive power.

In distribution systems, economies have been effected in several ways. Perhaps the most noteworthy of these is the almost universal application in Great Britain of the tap-changing transformer to increase the utility of existing branches of the secondary and distribution grids. Practically all of the large transformers have been fitted with tap-changing gear. The extension of this idea to smaller distribution transformers is now taking place rapidly. In these cases, a simple design of tap-changing gear with mercury switches is placed on the tops of the existing transformer tanks. New designs of induction regulators with increased voltage ranges and kilovolt-ampere ratings have been developed in Germany and are being applied in several countries for purposes similar to that of the tap-changing transformer. Similar economies are seen in the United States in the application of tap-changing transformers and induction regulators and also of phase-shifting transformers. Better power factors in both high- and low-tension lines have resulted from the further application of shunt static capacitors, thus reducing the power losses. (See also RURAL ELECTRIFICATION.)

Electric Transportation. While electric transportation is frequently considered as embracing only electric railways, the fact is that it includes also some thousands of electrically operated highway vehicles such as trackless trolleys, gas-electric and diesel-electric buses. All types of electric transportation have certain points in common, but their most recent developments have followed such divergent lines that they can best be classified under five separate headings: (1) electric surface railways, (2) electrically operated subways and elevated railway lines, (3) electric trackless trolleys or trolley buses, (4) electrified trunk-line railroads and (5) buses and trains operated electrically from self-contained generating units. All of the first four classifications receive their power from more or less remote electric generating stations of sizable capacity, while the last mentioned have their own power plants on the individual vehicles, using gasoline engines or diesel engines to drive electric generators which supply energy to the traction motors. The electric surface railways, the electrically operated subways and elevated railways, the electric trackless trolleys, and the electrically driven buses are operated, in the main, in urban transportation service. The electrified trunk-line railroads and the trains with self-contained electric generating units are operated, in the main, in long distance transportation service.

Electric Surface Railways.—For many years the electric street and interurban railways were virtually the only means of public passenger transportation in urban communities and adjacent areas. At the present time, however, that is not true. On the one hand the development of rapid transit subways and elevated railways has absorbed a part of the traffic formerly carried by the surface railways in the larger cities. On the other hand the development of automotive vehicles, both private and common-carrier, has absorbed another part of the traffic formerly handled by electric railways. To measure the exact effect of these several influences is extremely difficult. In the United States the total number of passengers carried by all forms of local transit service in 1939 was substantially greater than the number carried before the

advent of the automobile and was approximately 80% of that carried in 1929. In view of the fact that general business and industrial activity in 1939 was also about 20% lower than it was in 1929, the inference is that general business conditions have been the major factor influencing transit riding. In other words, the increase in the use of private automobiles has not greatly diminished the need for public transportation service.

The manner in which this service is rendered, however, has undergone far-reaching changes. Whereas the electric surface railways once enjoyed a virtual monopoly of public passenger transportation in urban areas, they now handle only about 50% of such riding. Subways and elevated railways carry about 20%, trackless trolleys about 5% and motor buses about 25%. In this connection it is interesting to note that an appreciable proportion of the buses are equipped with electric drive, so that it is not unlikely that as many as 80% of all transit passengers are carried on electric transportation vehicles.

While the relative importance of the surface electric railway has undoubtedly diminished, this form of transit service remains the largest single element in local transportation service. Recent years, indeed, have witnessed an energetic endeavour to modernize and improve electric surface railways. The United States and Canada have taken the lead in this activity. Since 1937 more than 1,100 modern, streamlined street cars have been purchased by transit companies in 13 cities in the United States and two in Canada. The great majority of these new cars are of the so-called "Electric Railway Presidents' Conference Committee" design, brought out in 1936 as the result of an extensive program of research to develop a new type of light-weight, fast, silent street car. Rubber springing and improved control and braking equipment are features of the design.

At the same time that modernization of street railway equipment has been going forward in U.S. and Canadian cities there has been similar activity in numerous cities in other countries. For example, the transit companies in Genoa, Milan, Oslo, Moscow, Brisbane and Buenos Aires have all installed new types of fast, streamlined cars with unusually attractive passenger accommodations.

Elsewhere the developments with respect to electric surface railways have shown mixed trends. Paris has replaced its entire street railway system with motor buses. London and Manchester have plans for eliminating all street cars and using a combination of motor buses and trolley buses. On the other hand, Glasgow and Liverpool continue to rely mainly on electric railways. In some cities where substitutions have been planned, their execution

*Total for three systems.

†Total for five systems.

has been held up since the outbreak of the European War, partly because of the difficulty of obtaining fuel for motor buses and partly because of the difficulty in securing new vehicles of any kind from the manufacturers. Some transit systems are reported to have withdrawn bus service and restored street railway service on certain routes because of the fuel problem.

Rapid Transit.—Growth of rapid transit facilities, subways and elevated railways, has progressed slowly but steadily during recent years in a number of large cities throughout the world. Even greater progress would undoubtedly have been made if the cost of providing such facilities had not been extremely high. This had tended to confine the construction of both subways and elevated railways to territory where the traffic is unusually dense. In 1939 there were only 12 cities in the world having extensive underground rapid transit facilities. These were Barcelona, Berlin, Boston, Buenos Aires, Glasgow, London, Madrid, Moscow, New York, Paris, Philadelphia and Tokyo. Construction was under way, however, on a subway project in Chicago.

Extensive elevated railway systems exist in Chicago, Hamburg, Liverpool, New York and Philadelphia. Besides these there are services which are essentially of a rapid transit character in a number of other places, including Cleveland, Vienna, Warsaw, and the San Francisco bay region.

The last mentioned, which commenced operation in Jan. 1939, connects the City of San Francisco with Oakland and nearby cities via the 8¼-mi. San Francisco-Oakland bay bridge and saves commuters 20 to 30 min. per trip in comparison to the time formerly required to cross the bay by ferry.

From the standpoint of size the subway under construction in Chicago is by far the most important new development in the rapid transit field. When completed it will provide 7.7 mi. of double, parallel tunnels through the heart of the downtown district of the city, connecting with existing elevated railway lines at out-

A STREAMLINED ELECTRIC LOCOMOTIVE pulls the "Trail Blazer," all-coach train put in service in 1939, for part of its run between New York city and Chicago

lying points. The estimated total cost of constructing this subway, without equipment, is \$46,000,000, of which \$28,000,000 is to be paid by the city of Chicago and \$18,000,000 through a grant from the United States Government. Had it not been for this grant the probability is that the project would not have been undertaken when it was. New York, Philadelphia, London, Paris and Buenos Aires have all extended their underground systems recently but none of these extensions has as much significance to local transportation in the territory served as the new subway will have to Chicago.

Most outstanding of the recent events in the field of rapid transit equipment has been the placing in service of a new type, streamlined, three-body articulated car by the New York Rapid Transit Corporation in the early part of 1939. This vehicle incorporates the latest types of aviation structural design in the use and assembly of aluminium alloys and the most recent developments in springing and mounting contributed by the rubber industry. In its design air conditioning is used for the first time in rapid transit equipment.

Trackless Trolleys.—Although it is a relative newcomer in the field of electric transportation, the trackless trolley, or trolley bus, has made astonishing progress in recent years. According to the latest available figures there were more than 6,000 of these vehicles in use in 1939 in a score of countries throughout the world. Great Britain and the United States were the leaders in this field, the former having some 2,600 such vehicles in operation and the latter approximately 2,400. Elsewhere there were about 1,300 additional trolley buses in operation, the largest system being that of Moscow, which was reported to have more than 500 vehicles.

Establishment of extensive trolley bus operations in Great Britain antedated that in the United States by a few years, starting in the reconstruction period following the World War (1914-18), when there was great need for improvement in transit facilities. At that time trolley buses were substituted in place of worn out tracks and tram cars in a number of British cities. This trend has continued steadily until the trolley bus has become one of the most important elements in local transportation in Britain.

Trolley bus growth in the United States may be said to have commenced in 1928 with the establishment of a sizable system at Salt Lake City. Prior to that there had been a number of small installations elsewhere but none of them was particularly successful. The improved vehicles operated at Salt Lake City, however, demonstrated the possibilities of this new form of transportation and its expansion has been continuous since that time. In 1939 there were 64 cities in the United States having trolley bus service and two in Canada.

The greatest use was made of this type of vehicle in the cities of medium size. A total of 30 U.S. cities between 100,000 and 500,000 population were in 1939 served in whole or in part by

LATE MODEL "TRACKLESS TROLLEY," placed in operation in Sept. 1939 at Wilmington, Delaware

trolley buses. In cities under 100,000 population there were 26 installations and in those over 500,000 population there were eight. Among the cities which decided to enter the field of trolley bus operation during the year 1939 were Denver, Ft. Wayne, Wilmington and Seattle. In the last mentioned city it was planned to abandon street railway operation entirely and install more than roomi. of trolley bus route with 235 vehicles, using also a considerable number of motor buses on feeder routes.

Electrified Trunk-Line Railroads.—New developments in the field of electrified trunk-line railroad operation have been relatively few in recent years. While there are more than 6,000mi. of electrified trunk-line track in operation in the United States there have been no important extensions since the Pennsylvania railroad completed the electrification of its main line between New York and Harrisburg. This lack of activity has been due to the high cost of constructing facilities for electric operation and to the popularity of the new trains operated by diesel-electric power (*see below*). In Europe there has been somewhat more interest in railroad electrification due to the availability of hydro-electric power and the desire to cut down the use of fuels which have to be imported. Even there, however, the use of diesel power has tended to retard expansion of railroad electrification.

Self-contained Electric Units.—Vehicles operated by electric power generated within the vehicle itself have been increasing in popularity in recent years. The first step in this direction was the development of the gas-electric bus about 1930, designed to eliminate the frequent gear shifting required in the operation of mechanically driven buses. While the early gas-electric buses were successful in accomplishing this purpose they had some serious disadvantages due to the fact that the generator output was not sufficient at the most economical speed of the gasoline engine. With the development of the diesel engine, however, it became possible to accomplish the desired result more satisfactorily and the use of diesel-electric buses has been growing rapidly. In 1939 there were about 1,700 gas-electric buses in operation in the United States and Canada and another 300 diesel-electric buses.

The same principle is also widely employed on trunk-line steam railroads. Many switching engines have been built with the diesel engines driving generators, the power of which is then transmitted to electric motors to propel the vehicle. More recently the same type of power has also been used to haul many high-speed passenger trains such as the "Zephyrs" operated by the Burlington, the "Rockets" of the Rock Island, the "Super Chief" of the Santa Fe, the "Streamliners" of the Union Pacific and the "Capital Limited" of the Baltimore & Ohio. A recent innovation in

Growth of Trolley Bus Operation in U.S. and Canada

Year As of Jan. 1	Number of Vehicles	Miles of Route	Cities Served

Ellis, (Henry) Havelock (1859–1939), British psychologist and author, was born on February 2 at Croydon, Surrey. Descended from sea-faring families, he spent much of his youth on the Pacific and for four years (1875–79) he taught school in various parts of New South Wales, Australia. Here, as a lad of 19, he determined that his lifework should be the study of sex. He returned to England, studied medicine at St. Thomas's hospital and after a short time in private practice became completely absorbed in literary and psychological work. He began his monumental *Studies in the Psychology of Sex*, but the book was without honour in his own country and was published only in Germany and the United States (for a partial list of his works see *Encyclopædia Britannica*, vol. 8, p. 374). Recognition of Ellis's work was belated, but scientists and laymen alike ultimately conceded that he had established a true scientific approach to a subject whose mere mention was often taboo in the early 20th century. In his later years Ellis led a secluded life in a poor quarter of London. He continued writing in his advanced age and published *George Chapman* (1934), *My Confessional* (1934), *Questions of Our Day* (1936), and *Sex in Relation to Society* (1937). His life story, *My Life*, appeared in 1939. He died at Hendlesham, near Ipswich, on July 8.

Emery. Properly speaking, emery is a mixture of corundum and magnetite, though in some of the inferior grades much of the corundum is replaced by spinel and other minerals. Although a heavy producer of emery during the World War, the United States now has no output, and imports the entire requirement, which dropped to 426 long tons in 1938. The best emery comes from Greece and Turkey, each of which exports about 15,000 tons annually. The Greek (Naxos) emery is considered best for grinding wheels, while Turkish is used for general polishing work and emery cloth. Grecian emery goes mainly to Germany and Netherlands, and Turkish to England. (G. A. Ro.)

Endocrinology. The year 1939 has been marked by further advances in the knowledge of the inter-relationship between the endocrine glands and the central nervous system. The nervous pathways which link the hypothalamus to the hypophysis through the pituitary stalk, have long been recognized anatomically. Within recent years Fisher, Ingram and Ranson have investigated the functional activity of these nervous connections and have shown that they are chiefly concerned with certain actions of the posterior lobe of the gland. Discrete destruction of the hypothalamic nuclei from which the fibres originate, leads to atrophy of the posterior pituitary accompanied by permanent diabetes insipidus. The same procedure in pregnant

animals causes protracted and difficult labour at parturition. The very recent work of Ingram has indicated a possible mechanism by which the posterior pituitary gland is influenced in its regulation of water metabolism. He found that the urine of experimentally dehydrated animals contained an antidiuretic substance similar in its action to extracts of the posterior hypophysis. Section of the pituitary stalk prevented the appearance of this substance.

The few and poorly defined nervous pathways to the anterior lobe of the hypophysis, have been described by Rasmussen. However, there is now some evidence for the functional importance of these nervous connections. It is possible that the gonadotropic hormone of the anterior hypophysis may, under certain circumstances, be released as a result of a reflex nervous mechanism. Thus, section of the pituitary stalk has been shown to prevent the ovulation which normally follows coitus or mechanical stimulation of the cervix in rabbits. Similarly the hyperplasia of the thyroid gland which follows exposure to cold, and which is presumably due to secretion of thyrotropic hormone, is absent in animals in which the pituitary stalk has previously been sectioned. However, the mediation of the central nervous system in the activity of the anterior hypophysis is apparently confined to those reactions which are initiated by stimulation of nervous receptors. The maintenance of functions such as growth and the trophic influences of the anterior pituitary on other endocrine glands, are not affected by sectioning the nervous connections in the pituitary stalk (*cf.* Evans-Uotila).

The importance of the hypothalamus in relation to phenomena which were formerly considered to depend primarily upon the endocrine activity of the anterior lobe of the pituitary gland, is also illustrated by the observations of Hetherington and Ranson upon experimental obesity.

They observed the incidental occurrence of marked obesity in cats, guinea-pigs, and a monkey, following experimental injuries to the hypothalamus in the course of studies on diabetes insipidus. More recently they have been able to produce marked obesity in rats at will, by punctate injury to the supra-optic nuclei of the hypothalamus.

Anterior Pituitary Gland.—Previous work has indicated that the various hormones of the anterior hypophysis resemble proteins in their chemical composition. A beginning has now been made towards the knowledge of their actual structure. Fraenkel-Courant and Evans have shown that incubation with cysteine potentiates the effect of the growth hormone, and inactivates preparations of gonadotropic hormone.

It therefore seems likely that the activity of these hormones is associated with —SH and —SS groupings in their molecules. This makes them comparable to the growing list of active proteins, including insulin and various tissue enzymes, which also depend upon these same groupings for their activity.

The diabetogenic and anti-insulin effects of extracts of the anterior lobe of the hypophysis have been explained in one of two ways: (1) An inhibition of the utilization of carbohydrate, or (2) an increased formation of sugar from non-carbohydrate sources. The recent work of Soskin, Levine *et al.* has substantiated the latter view. They have also found that the thyroid gland plays a significant role in the metabolic disturbance which follows hypophysectomy. The decreased formation of blood sugar which accounts for the hypoglycemia of fasting in these animals, is partly due to the secondary atrophy of the thyroid. This leads to a diminution in the rate of endogenous protein catabolism to amino-acids, thus limiting the available raw material for sugar formation. The difficulty can be obviated by the administration of thyroxine.

Thyroid.—It has been known for some time that all the activity of thyroid extract cannot be accounted for by the amount of

thyroxine which it contains. It has been found to be more accurate to assay the potency of thyroid extract on the simple basis of total iodine content. The work of Salter, Lerman and Harington indicated that the active portion of thyroid extract consisted of thyroglobulin associated with diiodotyrosine and thyroxine. Very recently, these same authors have shown that simple iodination of a serum proteins results in the formation of a complex having thyroid activity. This may mean that thyroid activity is not exclusively confined to one specific iodine compound. However, it is possible that the activity obtained in the above manner may have been due to the *in vitro* formation of thyroxine. Ludwig and Mutzenbecher (confirmed by Harington) have demonstrated the formation of thyroxine crystals by incubating casein with a compound solution of iodine.

Adrenal Cortex.—It has been generally supposed that the disturbance in sodium and potassium metabolism which follows adrenalectomy, is due to a change in the permeability of all tissue cells to these ions. This view has been modified by the recent work of Darrow, who showed that the primary effect of lack of adrenal cortical hormone is on the kidney tubules. This leads to an abnormal excretion of sodium and a retention of potassium, which in turn alters the mineral balance of the body as a whole. It is also becoming more apparent that the disturbed mineral equilibrium does not account for a large proportion of the abnormal phenomena associated with the metabolism of the foodstuffs. Nor is there any direct relationship between the degree of mineral imbalance and the symptomatology of Addison's disease.

Desoxycorticosterone, first synthesized and later isolated from adrenal cortical extracts by Reichstein, has been submitted to considerable clinical trial during 1939. It has been found to be quite potent in the correction of the mineral disturbance of Addison's disease and in the alleviation of some of the symptoms. At the present time, however, it seems likely that it will not be able to substitute completely for the adrenal cortex.

Ovary.—As regards the oestrogenic hormones, the initial exploratory work concerning the chemical structure of the naturally occurring substances has begun to give place to studies of their metabolism after they are secreted into the bloodstream. It appears that the body disposes of these hormones not only by excretion into the urine, but also by destruction in the liver. A striking illustration of the potential importance of the liver in the sex cycle may be found in the work of Talbot. He showed that the production of a functional deficiency of the liver by carbon tetrachloride poisoning in immature rats precipitated a persistent oestrus, presumably by permitting an accumulation of the sub-threshold amounts being secreted by the immature ovaries. In addition to excretion and destruction of the oestrogenic substances, it has also been demonstrated that the more potent forms of the hormone may be transformed to weak oestrogens in the body. Pincus found that oestrone is converted to oestriol by the non-involuted uterus of the rabbit. The presence of progesterone from the corpus luteum catalyzes this reaction. He has suggested that these processes may play an important role in the normal sex cycle and in parturition. It may be supposed that when the corpus luteum is functioning, the rapid conversion of oestrone to oestriol does not allow the building up of sufficient oestrogenic activity in the blood to stimulate the uterine musculature. But as the corpus luteum regresses, the sudden diminution in oestrone to oestriol transformation may raise the level of oestrogenic activity in the blood to a point at which uterine contraction is initiated.

The preparation of synthetic oestrogens continues. Dodds and co-workers have recently announced the synthesis of hexoestriol, a compound even more potent than the stilboestrols reported in 1938. As regards the latter, they have been subjected to con-

siderable experimental clinical trial during the year 1939. They have been found to be very effective in reproducing all the physiological and therapeutic effects of the naturally occurring hormones. However, the question of toxicity has arisen and is not yet settled. At the present time extreme caution must be exercised in the use of these and other synthetic products, for purposes other than experimental clinical trials.

Testis.—Within recent years the study of the chemical structure of the sex hormones has shown them to be closely related to the carcinogenic steroids. The relationship between the oestrogens and neoplastic growth has long been recognized clinically. The removal of the ovaries following excision of a carcinoma was found to minimize the possibility of metastasis or recurrence. Lacasagne has, more recently, demonstrated that the administration of large amounts of oestrogenic substance to susceptible strains of mice, significantly increased the incidence of breast carcinoma in the females. The males of the same strain, which ordinarily were free from cancers of the breast, did develop such neoplasms after treatment with the oestrogens. Murlin, *et al.*, have now reported work which attempts to discover the reason for the relative immunity of the male animals to tumour growth. They found that the administration of crude extracts of urine containing the various androgens and the injection of testosterone propionate into male rabbits implanted with Brown-Pearce carcinoma, significantly inhibited the growth and metastatic spread of the implants. Testosterone, androsterone and oestrone gave no evidence of any inhibitory effect. (See also *PHYSIOLOGY*.)

England: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature. In biography for 1939 the accent has remained on the late 18th and early 19th centuries. Coleridge has found, after many years, two new biographers: Sir E. K. Chambers, whose *Samuel Taylor Coleridge* might be described as a definitive précis of its subject, and Lawrence Hanson, whose *Life of S. T. Coleridge: the Early Years* is the initial volume of what promises to be the first full study of its subtle and complex hero. Mr. Hanson's judgment is, perhaps, occasionally a trifle suspect, but the voluminous and diligent documentation of his book will probably assure its place as a standard authority. The concluding volume of Ernest de Selincourt's *Letters of William and Dorothy Wordsworth* is a welcome contribution to the same field, as is Lord David Cecil's polished and scholarly study of *The Young Melbourne*. Other periods have not proved so fruitful, and apart from Sir Kenneth Clark's *Leonardo da Vinci* and Francis Steegmüller's penetrating analysis of *Flaubert and Madame Bovary* one can remember little of more than ephemeral interest.

Little noteworthy history appeared during the year 1939, perhaps because it was being made with such unpleasant rapidity. Karl Brandi's long-anticipated *Charles V* made its English debut; and Henri Pirenne, whose death has still further diminished the declining body of humane scholarship, published for the first time in England his *Mohammed and Charlemagne* and *History of Europe from the Invasions to the XVIth Century*. English historians produced nothing of outstanding importance, but in *English Scholars* David C. Douglas has given a useful and entertaining account of Restoration historical research; while in *The Englishman's Food* Professor Drummond and Anne Wilbraham have compiled a random, amusing and often valuable hotch-potch of dietary anecdote and information. The *History of the Times*, too, still like a wounded snake drags its slow length along, and has now reached 1889.

Belles lettres make a comparatively poor showing. Besides W. Force Stead's welcome edition of Christopher Smart's *Rejoice in the Lamb*, and a number of additions to the Nonesuch Library, the classics and near classics have been noticeable principally by their absence. Among the moderns, Ronald Knox (*Let Dons Delight*) has written one of his happiest parodies, Robert Lynd (*Searchlights and Nightingales*) has collected some felicitous essays, and W. H. Auden and Christopher Isherwood (*Journey to a War*) have given a slight but admirable kestrel's-eye-view of the Sino-Japanese conflict. But, as a whole, the more progressive literary movements have slowed down considerably, and the appearance of Cyril Conolly's new monthly *Horizon* hardly compensates for the disappearance of the *London Mercury* and the suspension of *New Writing*.

The death of Yeats set the tone of the poetic year. English poetry remains becalmed in a Sargasso, and Stephen Spender (*The Still Centre*), Dylan Thomas (*The Map of Love*), and W. H. Auden have done little but repeat, modify and embellish their former originalities. Roy Campbell's *Flowering Rifle*, which rhapsodizes naively over the slaughter of the Spanish republicans and vents some dubious economics, is full-blooded and makes a nice change whatever else may be thought of it. Only T. S. Eliot's *Family Reunion* showed a variation of its author's previous technique, and suggested that any of our popular poets still possesses a capacity for development.

Autobiography is still in full cry, but only *I Knock at the Door*, Sean O'Casey's purple but moving account of sordid youth in viceregal Dublin, provided the ruthless autovivisection that lovers of other people's self-analyses have come to expect. In milder vein, we had a second taste of Oliver St. John Gogarty's ribald anecdotes (*Tumbling in the Hay*) and a further instalment of J. B. Priestley's random reflections (*Rain Upon Godshill*). The usual crop of foreign correspondents gave their under-table views of current history and threw the usual slanderous sidelights on the private lives of tyrants; but Pierre van Paassen's *Days of Our Years*, though written in the lurid tradition of its kind, contains enough good new stories to make it worth remembering.

The year proved a bad year for philosophy and general science, though connoisseurs of metaphysical and anthropological curiosa will no doubt have enjoyed Gerald Heard's *Pain, Sex and Time*, and Verrier Elwin's study of *The Baiga*, an India people whose habits rival those of the Trobriand islanders. Freud's *Moses and Monotheism* has a melancholy interest as the last work of a great man, but cannot be regarded, even by his greatest admirers, as an essay of any major importance.

Not unnaturally, politics have been in the forefront of publishers' lists, and amidst all the chaff there appeared a small quantity of grain. Notable in the theoretical field was Hermann Rauschning's *Germany's Revolution of Nihilism*, a startling exposition of the nihilistic tendencies in Nazism. The same writer

was also responsible for *Hitler Speaks*, a sensational but allegedly first-hand account of the Fuehrer's machiavellian pronouncements on his social and political policy. What Rauschning does for Hitler, W. G. Krivitski does for the Russian ruling class, and in *I Was Stalin's Agent*, offers a bitter, lurid, but fundamentally convincing exposé of the facts behind the recent Soviet purges. In the sphere of reportage, there was little outstanding, save *Fallen Bastions*, G. E. R. Gedye's able analysis of the causes and effects of Munich; and *Behind the Battle*, T. C. Worsley's sensitive and amusing story of his adventures in the Spanish Civil War. Max Werner's *Military Strength of the Powers* attracted considerable attention when it appeared, but though his praise of Germany's mechanized forces and criticisms of the Polish army have been fully justified, his confidence in the Red Army's invincibility has so far been falsified by events.

Most of the more prominent novelists published characteristic work during 1939. Aldous Huxley, slightly to the surprise of some of his readers, made a reappearance in fiction, and in *After Many A Summer* combined the cynical wit of his earlier novels and the philosophic mysticism of *Ends and Means* into an entertaining but unsatisfactory synthesis. James Joyce has at last completed *Work In Progress* and published it under the title of *Finnegans Wake*. The whole, fortunately, is greater than the parts, and the rambling brilliances of the isolated sections have merged into a work of art. *Christmas Holiday*, Somerset Maugham's new novel, proved disappointing, probably because its author was unfaithful to his familiar environment; but *To Step Aside*, Noel Coward's first volume of short stories, showed that one popular writer at least has not exhausted his phenomenal vitality. Sir Hugh Walpole (*The Sea Tower*) and H. G. Wells (*The Holy Terror*) demonstrate that they have not lost their former skill, but neither book represents its author's best work.

The younger writers have been equally active. Christopher Isherwood (*Goodbye to Berlin*) concludes, one imagines, his saga of republican Germany; George Orwell (*Coming Up For Air*) makes another pleasant excursion into his lower-middle-class inferno; Graham Greene (*The Confidential Agent*) offers an intellectual thriller; and Ralph Bates (*The Miraculous Horde*) collects a volume of short stories in his best manner. (See also AMERICAN LITERATURE.) (J. MR.)

Entomology. The "most dangerous member of a dangerous family" of mosquitoes, *Anopheles gambiae*, now menaces the Western Hemisphere. This notorious vector of malaria was discovered within the city limits of Natal on the east coast of Brazil in March 1930. The principal home of the mosquito is in tropical Africa and it probably came across the Atlantic in a fast boat or in an aeroplane. In its native home, Fosdick writes, "It is the scourge of Central Africa, a carrier of a serious and often fatal type of malaria, sometimes complicated by the so-called 'black-water' fever."

It was hoped that the mosquito would not find conditions in the region of Natal suitable to its development and that it might be exterminated. On the contrary, an outbreak of malaria due to the activities of the mosquito, of a severity unknown to the city, took place during 1930 and 1931; and by 1931 the mosquito had spread northward along the coast for a distance of 115 miles. By 1938 it had gone over 200 mi. north and west of Natal nearly to the source of the Jaguaribe river. The virulent type of malaria which it carried to this extended territory developed an epidemic which afflicted nearly 60,000 people in a population of about 70,000, of whom more than 5,000 succumbed to the ravages of the disease. So far, the mosquito does not seem to have met any adverse conditions in Brazil that have shown a tendency to check its spread.

EVEN THE PAINT of farmers' homes was eaten by a horde of grasshoppers which destroyed crops along a 50mi. front in San Joaquin valley, Calif., in April 1939

Anopheles gambiae like *Aedes aegypti*, is a domestic mosquito which haunts the dwellings of man. It passes through its life cycle in 7 or 8 days, which enables it to increase rapidly and in great numbers. All of the evidence indicates that *A. gambiae* is the most dangerous vector of malaria in the hemisphere. Moreover, it seems likely, unless some method of checking its spread is devised, that it will eventually reach the southern United States in the north and Argentina in the south. "Should this occur, it would create a public health problem that would outrank all others in tropical America," Fosdick writes.

Entomological Control of Cactus in South Africa.—A remarkable effort is in progress in South Africa in an attempt to destroy the prickly pear, *Opuntia megacantha*, which densely infests well over 2,000,000 ac. in the Union, by the introduction and distribution of a moth, *Cactoblastis cactorum*, native to South America. The caterpillars of this moth live within the segments of the cactus plants eating out the soft interiors often leaving only the empty, thin, papery skins. Plants thus attacked collapse and are easily cleared from the land. During 1938, the entomologist in charge, Dr. F. W. Pettey, with his assistants, distributed 12,000,000 eggs of the moth on farms in the infested districts. To date, about 200,000,000 eggs, obtained from moths reared in three large breeding stations, have been distributed in lots of 200,000 on farms over-run with the cactus plants. The earliest established colonies of the moths have increased enormously and have spread over many hundreds of square miles. The destruction of the prickly pear plants by the caterpillars has been so extensive that there is reason to hope that the insect "will fulfil the purpose for which it was introduced." There are, however, forces inimical to the increase of the moths. Probably the worst enemy of the caterpillars is the baboons which are numerous in many localities. Curiously enough, these animals tear the leaf pads of the cacti open, pick out the caterpillars and devour them. Before distributing eggs of the moth on farms where baboons are present, the farmers are required to trap and destroy them. It is not uncommon for a farmer to trap over 300 baboons in six months' time. Monkeys and flesh-eating ants are also enemies of the caterpillars. The mucilaginous sap of the cacti also catch and destroy many of the larvae when young. Similar work against prickly pear is being carried on in Australia where the cacti have invaded a much greater area than in South Africa. The work began earlier in Australia. The *Cactoblastis* moth was introduced in 1925 and appears to breed rather more freely and rapidly than in South Africa.

The Potato Beetle in Europe.—Although the Colorado potato beetle, *Leptinotarsa decemlineata*, is an insignificant creature yet it was the subject of a good deal of attention in Europe during 1939, especially in Germany when going to war. Potatoes constitute an important food crop of peoples in northern Europe, a crop easily grown, harvested, and stored. Anything that tends to lower its production seriously becomes a source of considerable anxiety. Special effort was, therefore, made in Germany during 1939 to control the ravages of this pest. In Spain, the beetle caused trouble from a phase of its presence in that country entirely apart from its direct injury to the potato plant. Northern Spain, during past years, produced potatoes as an export crop to the British Isles. During the late civil war the beetle entered Spain, probably from France, and now the growers find themselves greatly handicapped by a quarantine against their crop because of the danger of introducing the beetle with the export shipments of potatoes. Early in 1939 while Poland still existed as a nation, an inquiry was made by an official of the Polish department of agriculture regarding the severity of the injuries caused by the beetle in the United States and the effectiveness of the spray program in holding the insect in check. The official stated that he had lately been in Holland and Belgium meeting with a committee for the study and control of the Colorado potato beetle. It is evident that the presence of this insect in Europe is looked upon as a most serious problem.

A Miscellany.—The white-fringed beetle, *Pantomorus leucoloma*, formerly placed in the genus *Naupactus*, is a native insect of South America. It was first found in the United States in Alabama and Florida in 1936. It had already in 1939 spread into Mississippi and Louisiana and will probably go to other States. Although it appears to be an inhabitant of warm countries it may prove capable of living in colder regions, in which event the beetle may spread much farther north. The adult beetle is about one-half inch in length, grayish in colour and with a whitish stripe or fringe along each side of the body. It is a stout beetle with a short broad snout. It cannot fly but is active in crawling over the ground often in groups of considerable numbers. It is carried

A NEW DUST, sprayed on citrus fruit and walnut trees by a fish-tailed machine, controlled the ravages of the citrus red mite in California in 1939

to distant regions through the channels of commerce.

The beetle does most of its injuries in the larval or grub stage. The grubs often exist in the soil in great numbers, sometimes as many as 200 to the square yard. They eat off the roots of the plants on which they feed and they attack practically all field and garden crops and ornamental plants. The grubs have caused notable injury to such important crops as cotton, peanuts, beans, potatoes and sugar cane. The beetle is now so widely distributed there does not seem to be any possibility of exterminating it. Thorough and extended study of its life history and habits is in progress with the hope of finding practicable methods of checking its injuries.

The Japanese beetle, *Popillia japonica*, has gradually but relentlessly extended its area of distribution in the eastern United States until it is now present from Maine to the Carolinas through the coastal States and has crossed the Mississippi river in its westward march. Its principal concentration is still in a few of the middle Atlantic States, New Jersey, Pennsylvania, Delaware and Maryland. During the past summer (1939), some perturbation among the inhabitants of New York city was caused by the sudden appearance of considerable numbers of the beetle within the confines of the city, an awesome visitation of a strange, alarming creature.

Much careful work has been done in importing and distributing parasites to prey upon the Japanese beetle but the full effect of these parasitic forms will probably not be apparent for some years to come. On the other hand, a bacterial disease of the grubs known as the "milky disease," has developed in New Jersey which has proved to be surprisingly effective in reducing the population of the beetle. Many millions of the milky disease spores develop in the body of a single grub and the spores are capable of remaining dormant for several years yet retaining their viability during this period. The spores have been recovered from chickens and starlings and it is believed that they are distributed by birds. This disease seems to be the most hopeful natural agent that has been discovered for checking the increase of the beetle and for striking a balance in its relations to mankind. Not too much confidence, however, should be placed in the work of the disease because in other regions and under other climatic conditions it may not prove so virulent. It may be several years before the full value of the disease can be measured.

The blowfly (*Lucilia cuprina*, et al.) problem in connection with the production of sheep and wool in Australia is still a serious one. Intensive investigation of the habits, life history, and ecological relations of the flies is in progress. One of the essential requirements of this work is an ample and regular supply of the larvae for the laboratory and field experiments. To fulfil this demand, the larvae must be reared artificially on some sort of synthetic medium. Yeast in combination with sodium chloride with enough agar added to give the right consistency, has proved satisfactory. The larvae grow more rapidly, however, if the white of egg is used in place of the agar. In case of the yeast medium, it is believed that no previous record of the successful rearing of "flesh-fly larvae" in the absence of animal protein is known. This is an interesting by-product of the investigation.

Insects of the Air.—A summary of an extraordinary series of collections of wind-drift insects in the air at altitudes varying from 20ft. to 15,000ft. has been published. The insects were collected in specially constructed traps fitted to the wings of various types of monoplanes and biplanes. The work was performed mostly in the United States in the State of Louisiana, but a limited amount of collecting was done in northern Mexico. In all, 30,033 specimens of insects, spiders and mites were collected at the various altitudes. It is of interest to note that in Louisiana at altitudes

JAPANESE BEETLES (magnified approximately three times) spread to 16 eastern States and to Ohio in 1939. They destroy trees, vegetables, grain and flowers

of 200ft. a total of 13,389 specimens were taken, all of which, except 653 spiders and mites, were true insects (Hexapoda). At an altitude of 1,000ft., 4,376 insects were collected, while at a height of 2,000ft., 2,127 insects were caught in the traps. Varying, but lesser, numbers were taken at other altitudes and 10 insects were caught at a height of 14,000 feet. Specimens were taken in every month of the year but most, per ten minutes of daylight flying time, were collected in May while the least number in the same flying time was taken in December and January. It is rather surprising that numbers of wingless adult insects as well as nymphs and larvae were collected from the air even up to altitudes of 14,000 feet.

Temperature proved to be the most important factor governing the number of insects in the air at any given time. A surface temperature of 75° to 79° F. appeared to be the most favourable for insects to take to the air. The velocity of wind currents influences greatly the distribution of insects through the air. When the velocity of the wind at the surface was 5 to 6mi. per hour the largest number of insects at the lower altitudes was taken. In speaking of the wingless specimens taken at altitudes above 5,000ft., P. A. Glick says it is likely that these forms were "carried in the upper air currents, perhaps for hundreds of miles. By means of these avenues of travel insects have been distributed to far countries, to remote islands, over mountain barriers and across stretches of hot, barren deserts and waste lands."

Locusts and Grasshoppers.—Grasshoppers and locusts are still among the most destructive crop insects in the world. Huge swarms of locusts were reported during the year in Argentina, South America. The Government ordered navy aeroplanes, equipped with tanks containing special toxic chemicals, to spray the swarming insects.

From large areas in the western United States came early reports of invasions of grasshoppers. An emergency Federal appropriation of \$1,750,000 was given to the Department of Agriculture to finance the fight against the insects. In addition, several States supplemented the Federal funds with appropriations of their own.

All of the area of the Great Plains region from Montana to Texas and eastward to Wisconsin and Missouri suffered from the ravages of grasshoppers. The Pacific Coast States also were subjected to severe injuries in various localities. Colorado "experienced the worst outbreak of *Dissosteira longipennis* in the agricultural history of the State, embracing an estimated infestation of over 4,000,000 ac. of native sod land." It is estimated that the value of the crops and range destroyed exceeded \$5,500,000.

In North Dakota the locust, *Melanoplus mexicanus*, was the predominant species. On the whole, the damage to crops in the State was less than in 1938 due largely to the effective methods of control. A survey has shown that throughout the northeastern part of the State the deposition of eggs has been abnormally large, a condition which presages a severe infestation of grasshoppers next year in that region. (See also MALARIA.)

Epidemics and Public Health Control.

One great advance in the control of communicable diseases was the development and use of sulphanilamide and sulphapyridine, especially in pneumococcus pneumonias. Siler and Dunham have shown that "revaccination against typhoid fever of previously immunized persons with one intracutaneous dose of 0.1 cc. of typhoid vaccine produces an immunologic response which is comparable to that following original vaccination with three subcutaneous injections of vaccine."

Transmission of the viruses of the Eastern and Western strains of equine encephalomyelitis to man appears to be a probability. From epidemiologic evidence it seems likely that the equine virus is transmitted to man through some vector. Neutralizing substances of the Western strain have been found in sera of 32 out of 86 encephalitic cases diagnosed in 1937 and 1938.

Bundesen, Fishbein and White point out that the results obtained in diphtheria prevention with toxoid inoculations did not approximate expectations. By employing antitoxin determinations of the blood in children previously inoculated with various types of antigens, they indicate that three doses of the plain toxoid at monthly intervals seemed to give the best results. There seems to be a gradual loss in the antitoxin content of the blood with the passage of time. They recommend, therefore, the revaccination of children with one dose of some antigen at intervals of from three to five years in order to maintain a sufficiently high level of antibodies to ward off the disease.

Successful transmission of the Lansing strain of poliomyelitis virus to the Eastern cotton rat was reported by Armstrong from the National Institute of Health. The strain has been carried in series through seven cotton rat transfers, and animals of the eighth transfer had begun to develop symptoms at the time of reporting. Paralysis of the flaccid type developed in all. This animal is not vicious, multiplies readily in captivity, and, in view of the probable interference with the importation of monkeys during the European war, may prove invaluable in continuing experimental investigations of infantile paralysis.

Some investigators are inclined to deduce from serologic evidence that the virus of swine influenza is a surviving prototype of the agent primarily responsible for the great human pandemic

of 1918. Shope is of the opinion that "Lungworm larvae from pigs with swine influenza harbour swine influenza virus throughout their development both in their intermediary host, the earthworm, and their definitive host, the swine. The virus apparently lies latent within the lungworm after the parasite has finally migrated to the swine respiratory tract and is only liberated or activated to cause infection when a provocative stimulus is applied." In his hands multiple intramuscular injections with living *Haemophilus influenzae suis* cultures or a single intraperitoneal injection with calcium chloride solution were equally effective as this potentiating agent.

If these facts are so, then hogs and earthworms may conceivably serve as the source of some future human epidemic of influenza. (For syphilis control see VENEREAL DISEASES.)

Estonia, area 18,371 sq.mi.; pop. (est. Jan. 1, 1939) 1,133,940. Chief towns: Tallinn (cap., 145,000), Tartu (60,500); Narva (24,000); Nõmme (21,000); Pärnu (21,500). President: Konstantin Päts; language: Estonian; religion: Christian (Lutheran 75%, Greek Orthodox 19%).

History.—While the Anglo-Russian negotiations were in progress, Estonian opinion was more favourable to the Anglo-French proposals for limited assistance if such assistance should be required by Estonia, than to the Russian proposals to guarantee her either with or against her own consent. After the conclusion of the Russo-German pact in August, however, Estonia saw no choice but to accede to the Soviet demands for the lease of naval and air bases in the islands of Ösel and Dagö and the town of Paldiski, and on September 29 she concluded with Russia a pact to that effect, ratified on October 2. This was followed on October 8 by the resignation of the Government, and on October 10 M. Uluots formed a new government, with M. Piip as foreign minister. The incident of the escape from Tallinn on September 18 of the interned Polish submarine "Orzel" led to the dismissal of the commander-in-chief of the navy and the chief of the naval staff. On October 18 telephone and wireless communication with places abroad was prohibited, and a censorship of postal and telegraphic communications abroad and of telephonic communications at home was instituted. Repatriation to the Reich of German Balts in Estonia began on October 20 and was completed on November 14. Of the 15,000 eligible, 10,000 are said to have emigrated, and 3,000 to have chosen to remain in Estonia. A Government bill provided for the compulsory liquidation of the possessions of repatriated Germans, the estimated value of German property in Estonia being 500,000,000 kroons.

Education.—Schools: elementary 1,224; secondary 132; universities 2.

Banking and Finance.—Revenue (est. 1939-40), 105,875,187 kroons; expenditure (est. 1939-40), 105,816,637 kroons; public debt (March 31, 1939) 127,292,630 kroons; notes in circulation

"WHILE THE SUN SHINES." This cartoon by Little of *The Nashville Tennessean* was drawn after Russia signed the first of its series of dictated Baltic pacts—with Estonia on Sept. 29, 1939

(Aug. 31, 1939) 57,000,000 kroons; gold reserve (Aug. 31, 1939) 40,900,000 kroons; exchange rate (1939) 18.11-18.35 kroons (Ekr.)=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports (1938) 107,198,000 kroons; (Jan.-Aug. 1939) 73,446,000 kroons; exports (1938) 103,928,000; (Jan.-Aug. 1939) 77,847,000 kroons. Communications and transport 1939: roads, suitable for motor traffic 12,343mi.; railways 889mi.; shipping (June 30) 177,200 gross tons; motor vehicles licensed (Jan. 1, 1939) 8,896.

Agriculture, Manufactures, Mineral Production.—Production in 1938 (in metric tons): shale oil 140,000; wood pulp 90,800; potatoes 997,600; milk 975,500; rye 188,000; (1939) 204,300; wheat 85,400; (1939) 80,700; butter (export) 14,730; flax (fibre) 7,600; paper and paper boards 19,300. Industry and labour: industrial production (1929=100) (average 1938) 145.5; (July 1939) 162.6; index of employment (1929=100) (average 1938) 146.8; (July 31, 1939) 155.6; applicants for work (average 1938) 1,233; (July 31, 1939) 460.

Etching. The art of etching, as practiced throughout the world in 1939, continues to grow in favour among both artists and laymen, both nationally and internationally. With the increased tempo of modern life, the wider distribution of wealth, and the trend towards smaller homes with consequently less wall space for the accommodation of pictures, the etching, which is smaller, easier to handle, less costly, and, since by the inherent nature of the process capable of multiplication, susceptible to wide distribution, is steadily gaining in popularity as a means of original graphic expression. First practiced, in the sense in which we know it today, in Germany and the Low Countries in the 16th and 17th centuries, etching had its great period in Italian art in the 18th, its Golden Age in France in the 19th, and today finds its broadest outlet in England and the U.S.A.

Since the death of Forain, France has had no great leader in the field of etching, yet Achener, Adam, Berg, Bonnard, Boullaire,

Cami, Goërg, Grandgérard, Guastalla, Laurencin, Legrand, Lévy, Maillol, L.-A. Moreau, Myr, Orovida, Picasso, Possoz, Rouault, Rouvière, Segonzac, Villon and Vuillard are carrying on the great tradition of French etching in all its phases.

Neither in Italy nor in war-torn Spain have any new etchers of significance arisen during 1939. In the former country the traditional style has been carried on by Barriviera, Bellotti, Boglione, Luthmann, Mainini, Mauroner, Petrucci, Pietra and Mazzoni-Zarini, while the Spaniard Dali, working in the United States, has produced some prints noteworthy for the beauty of their linear quality.

Little of importance has come from Germany, the existing form of government being unsympathetic to original artistic expression. The greatest living German etcher, Kaethe Kollwitz, is now an aged woman, and contemporary work on copper is being carried on by Jansen, Luiko, Mayer, Richter, Schultheiss and Sintenis. Polish print makers of today have devoted themselves largely to the block-print, but Konstanty, Bernard, Maria, Ignacy, Zofia, Ludwik and Wladyslaw have worked upon copper and were represented in the Polish Pavilion at the New York World's Fair (1939). Among the etchers of Hungary and Czechoslovakia, Julius Komyáti and J. C. Vondrous, the former trained in England and the latter in the United States, have produced fine figure subjects, landscapes and architectural plates. Other contemporaries are the Hungarians Poharnok, Szönyi, Weil and Zádor.

Arabia continues to be represented by Barada; Argentina by Bernado, Castagna, Lasansky and Villafañe; Belgium by Danse and Heymans; Bulgaria by Nenoff and Staikoff; Canada by Taylor; Finland by Tandefelt and Segerstråle; Holland by Ykelenstam; India by Dey; Mexico by Avila; Palestine by Wittenberg; Sweden by Johanson, Sparre and Veslen; and Switzerland by Lieven.

Due, probably, to the firm roots of conservative art in England and the many excellent schools where the traditional spirit is fostered, British etching has been less affected by the so-called "modern" influence than has that of any other country. A large section of the annual exhibition of the Royal Academy is devoted to prints, and the Royal Society of Painter-Etchers and Engravers, now headed by Malcolm Osborne, holds a comprehensive annual London exhibition of the work of its members. The famous triumvirate of Scottish etchers, Bone, master of the dry-point medium, McBey and Cameron, the last named now inactive in etching, head any list of contemporary British etchers. Others who have published and exhibited work during 1939 are Aspden, Austen, Brammer, Briscoe, Buckton, Burridge, Cown, Currey, Delleany, Dent, Drury, Earthrowl, Fisher, Freeth, Gibbs, Gill, Hardie, Hayes, Hope, Hudson, Janes, Josset, Kemp-Welch, Moody, Osborne, Robins, Smart, Spence, Squirrel, I. Strang, Taylor, Thompson, Van Abbé, Warlow and Woollard. Brockhurst, famous for the extreme refinement of his technique, has visited the United States and held two large exhibitions of his etchings in New York city.

Etching in the United States is probably more active than in any of the major centres in Europe, due to the unsettled conditions existing in the latter. The three leading print societies, the Society of American Etchers, the Chicago Society of Etchers and the Print Makers' Society of California, together with numerous other similar organizations all over the country, held their regular annual and travelling exhibitions, while under Government administration an extensive program was continued in the field of prints, the work so produced being assigned to various public institutions, such as museums, libraries and schools. Although Benson, the famous etcher of wildfowl, is no longer active, J. E. Allen, Bacon, Berdanier, I. Bishop, R. E. Bishop, Bobleter, Borne, Botke, Botts, Butler, Cadmus, Chamberlain, Cook, Costigan,

Daniel, Detwiller, Eby, Frame, Ganso, Grant, Handforth, Heintzelman, Higgins, Hoffman, Hutty, Kappel, Kloss, Kupferman, Landeck, A. Lewis, M. Lewis, Loggie, Lucioni, Margulies, Marsh, H. Miller, K. H. Miller, McNulty, Nisbet, Osk, Ostrowsky, O'Toole, Partridge, Petersen, Price, Reynard, Rosenberg, Roth, Ryder, Schaldach, Sloan, Sterner, Tittle, Vargish, Washburn, S. M. Weber, Williams, Winkler, Woiceske, C. H. Woodbury, G. Wright, R. S. Wright, M. Young and H. Webster, the last named living in Paris, all produced new work in 1939. During 1939 American etching lost two significant figures, L. Easton and the veteran G. E. Burr. The most comprehensive and representative exhibition of contemporary American prints ever brought together, consisting of 408 examples, was assembled by an elaborate jury system for the New York World's Fair. Another occurrence of importance in the print field was the organization of a National Committee of Engraving, along lines similar to those followed by corresponding bodies in France and England, for the purpose of promoting the interests of prints both nationally and internationally, chiefly by the interchange of exhibitions between the countries of the world.

(J. T. AR.)

Ethical Culture Movement. A new type of religious fellowship, founded in New York in 1876 by Felix Adler, and in London in 1886 by Stanton Coit. Instead of agreement on a common theological creed, the basis is "dedication to the ever-increasing knowledge, love and practice of the Right." Extension of ethical knowledge is considered equally important with improvement of practice in personal, social, political, national and international relations. The American Movement is represented by active societies in New York, Chicago, St. Louis, Philadelphia, Brooklyn and by groups in West Chester and elsewhere. These are united in the American Ethical Union (secretary, George E. O'Dell; headquarters, 2 West 64th st., New York), which holds annual conferences and publishes a monthly magazine (*The Standard*) and other literature. The first social settlement house in America was established by the Ethical Movement, which also pioneered in establishing district nursing and legal aid to the poor, housing reform, and improved methods of education. (Schools are conducted by the New York and Brooklyn Societies; also social settlements by the New York, Chicago and Philadelphia Societies.) In 1939 much work was done in aiding refugees from German persecution. The New York Society organized the Good Neighbor Committee (interdenominational) for this and other co-operative purposes. The English Ethical Societies are organized in an Ethical Union (chairman, Lord Snell, 12 Palmer st., London, S.W.1.).

BIBLIOGRAPHY.—*Fiftieth Anniversary History of the Ethical Culture Movement* (ed. H. J. Golding, New York, 1926); G. Spiller, *The Ethical Movement in Great Britain* (London, 1934). An extensive literature has been produced by Felix Adler, W. M. Salter, Stanton Coit, Walter Sheldon, A. W. Martin, H. J. Bridges, Percival Chubb, and others. (Ho. J. B.)

Ethiopia: see ITALIAN COLONIAL EMPIRE.

European War. The Contributory Causes.—On Sept. 1, 1939 the European war, the most unpopular war in history, began with the German invasion of Poland. The duration and consequences of this war lay far beyond the horizon of reasonable predictions. The basic causes appear quite clear. As the last year of the fourth decade of the 20th century opened, approximately two-thirds of the world population were engaged in war. In Western Europe six nations were actively engaged in conflict on land and sea and in the air, with nearly 13,000,000 men under arms; while hundreds of millions of nationals turned away from peaceful pursuits to face the precarious existence of the civilian in war time. The 25 years between 1914 and 1939 had

the character of a great tragedy. The World War (1914-18) raised no victorious nations and filled men with a loathing for war and the conduct of war. Through the period 1920 to 1928, the world community adopted agreements in politics and economics designed to more closely approach a more permanent peace based upon democratic forms, seeking social justice for all creeds, all classes and all men in all societies. Democracies saw responsible Governments waver and fall before the onslaughts of depression and dictatorship. Democracies failed to find a solution for internal problems, and looked across troubled frontiers toward neighbours faced with similar problems and joined in common apprehension. The progress and the optimism of the '20s gave way to the paralysis and the disillusionment of the '30s. Millions realized that a crisis was at hand, yet all hoped that war might be rejected as a solution.

(a) *Europe Prior to the Munich Agreement.*—The period between Jan. 1936 and the Munich Agreement in Sept. 1938 records the triumph of totalitarian government over the system of collective security adopted after the World War (1914-18). The list of triumphs is impressive. The Spanish Civil War in which Russia, Germany and Italy were implicated, the Sino-Japanese military conflict blandly classified as an incident, British experiments in European diplomacy without benefit of the blessings of the League, the proposals for reform or revision of the Covenant of the League, and the German annexation of Austria, all were steps toward the final victory. Early in 1936, England and France were unable to reach agreement on the adoption of sanctions against Italy engaged in the conquest of Ethiopia. The failure of these major states to find a common solution within the framework of collective security procedure opened the door to prompt and vigorous action by the totalitarian states in pursuit of wider advantages. Concurrently, the weaker states regarded the failure as ill omen for future security of the system in which they had placed their collective faith.

In March 1936, Germany announced that the Treaty of Locarno was considered non-effectual and the Reichswehr occupied the Rhineland. The French and British Governments again failed to rally to the support of proposals of condemnation of this new breach in the system of treaty agreements. The nations of Europe accepted the growing disintegration of leadership with increased concern for their own safety and with rapidly rising fear and suspicion of the complete failure of the post-war system. Proposals and counter-proposals for remodelling the Covenant of the League were the subject of heated debate, but found cold reception during the balance of the year of 1936. In England, Neville Chamberlain succeeded Stanley Baldwin as prime minister in May 1937. In June, Monsieur Chautemps rose to power in France. British foreign policy abruptly changed from adherence to the methods of collective agreement to the pursuit of solutions best for the British alone, and the result of direct negotiations.

Domestic disturbances in France and the consequent insecurity of the Government shook the confidence of her allies. Poland appeared to accept the growing control of Germany in Danzig. Belgium adopted a neutral attitude as a national policy. Yugoslavia drew closer to Italy, and Rumania became preoccupied with the extensions of a more rigid monarchical rule. In republican Czechoslovakia the Sudeten question burned more fiercely under German blasts against the independent Government leaders. In Russia a series of purges among political and military figures resulted in practical isolation from Western Europe. The Little Entente lay dying. The Franco-Soviet pact appeared dead.

The Nov. 1937 agreement between England and France signalled the formal adoption by Mr. Chamberlain, with French approval, of his experiment in appeasement. The former leaders in the establishment and maintenance of the post-war system of collec-

tive security, in joint negotiation, announced the desire of their governments to co-operate with all countries in the common task of promoting international appeasement by methods of free and peaceful negotiation. It is significant that the League was not mentioned. This announcement followed by a few days the public notification by Germany, Italy and Japan of a common anti-Communist protocol. Far from seeking a solution to joint problems by negotiation, the protocol pointed a warning finger toward the creation of a world order in which the really vigorous nations could live together.

In Dec. 1937, the Rome-Berlin Axis became a reality when Italy withdrew from the League of Nations and Germany announced that her return to Geneva would never be considered.

In Feb. 1938, Anthony Eden resigned from the Government in England and Mr. Chamberlain rejected the imposition of sanctions and use of force in the solutions of European problems. Within a month Germany annexed Austria without fear of French or British interference and in disregard of Treaty restriction or League guarantees. (See also LEAGUE OF NATIONS.)

In April Mr. Chamberlain concluded an Anglo-Italian agreement directly with Premier Mussolini in pursuance of his announced intention for free negotiation. The smaller states in Europe swung sharply away from the closely co-operative post-war commitments and sought refuge in the bravely defiant announcement of neutrality in the event of the future hostilities they sensed just beyond the horizon. The climax in the conflict between force and free agreement approached ominously and with devastating speed. August was filled with alarms and intense excitement, the result of the Czech crisis. The demands of Germany were clear and the intentions obvious to all observers.

Above all other events during the period since Jan. 1936, the question of the defence or the desertion of the Central European republic stood paramount above all others. The definite repulse of totalitarian methods or the rejection of collective security and post-war agreements remained a decision for Great Britain and France. Britain continued the pursuit of free negotiations, and Mr. Chamberlain opened direct negotiations with Adolf Hitler at Berchtesgaden and Godesberg. On Sept. 29, 1938, before a paralyzed and bewildered world, France and England joined Germany and Italy at Munich. The policy of conciliation to the dominant power politics of the totalitarian states resulted in abandonment of the post-war system of collective security and the rule of law, and in the victory of power politics and the rule of force.

(b) *The Munich Agreement and Appeasement.*—The terms of the agreement accepted at Munich may be summarized as follows:

(1) The Czechoslovakian Government to withdraw from the frontiers of Bohemia and in the adjoining territories claimed by Germany; withdrawal to be made between October 1 and October 7.

(2) The conditions governing the evacuation of additional territory and the determination of additional areas of predominantly German character to be decided by an international commission, with members from Germany, Italy, France, and Great Britain, allowing occupation of these areas not later than October 10.

(3) The Czech Government to be held responsible for the maintenance of all existing installations.

(4) The international commission to determine areas in which plebiscites were to be held not later than November 30.

(5) The final delimitation of the new frontiers to be determined by the international commission.

These agreements were presented to the Czechoslovakian Government representatives, M. Jan Masaryk and M. Mastny, on Friday, September 30, by Mr. Chamberlain and M. Daladier.

It is reported that the Czech representatives were not allowed to participate in the preliminary discussions which led to the final agreement, and further that they were advised to accept the decisions promptly and without protest. M. Masaryk has been quoted in comment on these circumstances substantially as follows: "It was a matter of condemnation without appeal and without possible modification." The end of independence was in sight for Czechoslovakia. War in its combat phase had been

averted. However, the conclusion of the Munich Agreement marked one more phase in the "white war" or war of nerves.

Mr. Hitler and Mr. Chamberlain reached another agreement at Munich which requires examination. This agreement took the form of a statement of three clauses expressing their joint opinion on the future relations between Britain and Germany. In effect the clauses were:

(1) That the question of Anglo-German relations was of the first importance for the two countries and for Europe.

(2) That the Munich Agreement and the Anglo-German Naval Agreement were symbolic of the desire of the two peoples never to go to war with one another again.

(3) That the manner of consultation should be the method adopted to deal with in every question concerning the two countries, and that efforts should be continued to remove possible sources of difficulty and thus contribute to assure the peace of Europe.

This agreement appears to be no more than an expression of opinion by the two individuals who signed it. It indicates clearly the desire of Mr. Chamberlain to pursue direct negotiations outside the field of collective security procedure. It was not considered a treaty by the German Government, although it appears to have been accepted by the British prime minister as a charter for continuing the policy of appeasement. Mr. Chamberlain stated that he considered that the Munich Agreement would give Czechoslovakia "a greater security than she had ever enjoyed in the past." And it is equally true that he considered his agreement with Adolf Hitler on Anglo-German relations to give all the peoples of Europe a greater security than had been possible up to that date.

The Munich Agreement marked the beginning of the close of the policy of appeasement practised by England and France toward the central power of Europe—Germany. It is true that as late as March 1939 the British Government assured journalists that the policy of appeasement had never shown greater success in ensuring an era of peace in Europe, but this assurance was based upon wishful thinking rather than a record of practical accomplishment in the direction of attaining peace. The policy of appeasement had been adopted in an attempt to placate those nations who challenged the post-war system of collective security. An analysis of the policy indicates that it resulted in frequent financial assistance to Germany and Italy, the promised and occasional reduction of armaments and finally in the acquiescence and conquest of weaker states. Opponents of the policy of appeasement considered it evidence of political intransigence, fear of a major European upheaval, and shabby irresponsibility toward the destiny of the weaker states of Europe and Africa. Those in favour of the policy offered evidence that it resulted from a growing concern for the stability and preservation of moral, political and economic values in modern Europe.

It is quite probable that historians will consider the policy to have been a natural development of the post-war demoralization which for 20 years permitted apathy and indifference to be ever-present at European conference tables. Leaders avoided the duties and responsibilities of high office. Integrity was the exception rather than the rule. Standards were lowered in the conduct of interstate relations. Defeatism and cynicism captured the weak, and defiantly proclaimed the "aggression" to be "pacification."

(c) *The March to Prague.*—The march of the German Army into Prague closed the period of the independent rule of law in Czechoslovakia, shocked Britain into a realization of the practical dangers facing the Empire, aroused Western Europe to the imminent horrors of war, and swung world opinion sharply away from tolerance toward totalitarian methods to abrupt protests against further aggression. The important steps in the actual invasion and capture occurred in March 1939. On March 10 a revolt against the Prague Government was organized in the Province of Slovakia. On March 13 the German Army troops in Bavaria and Austria moved up to the Czech frontier. On March

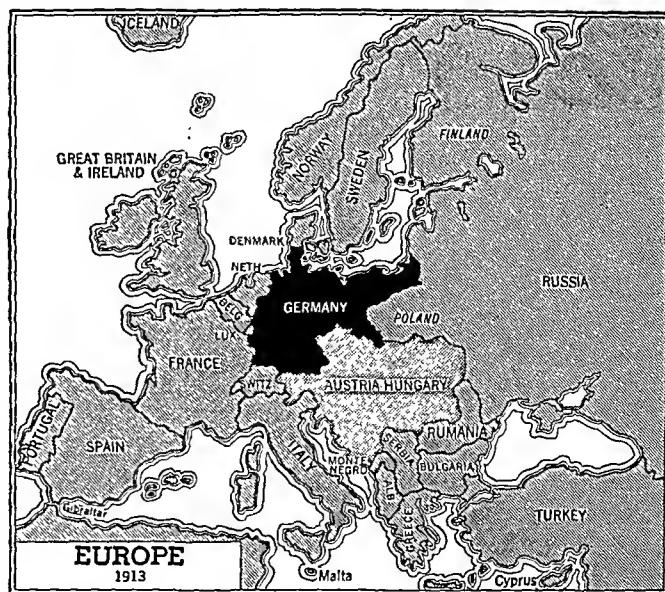

14, M. Hacha, the President of the Republic, was summoned to Berlin. It appears that a demand was presented to him for agreement which would result in the final disappearance of any independent government in the remaining territory under Czech rule. Whether the agreement was presented as a demand or arrived at freely by mutual consent is not known to this writer. However, the following statement was issued on the morning of March 15, 1939: "The Czechoslovak President has declared that in order to reach a final pacification, he would place the fate of the Czech people and their country confidently in the hands of the Fuehrer of the German Reich." The action of the German army was swift and overwhelming. Within three hours following the announcement quoted above, the German armies occupied Bohemia and Moravia. Adolf Hitler entered the city of Prague at 7:15 P.M. that evening. Without a single armed conflict of any serious importance and with the incredible speed which had become standard practice in the "white war" of nerves, Germany had captured the last remaining stronghold of Czechoslovakian independence. Another victory for power politics had been secured.

The reaction in England was a prompt and complete reversal of the Government policy of appeasement. On the 17th of March, 1939, speaking at Birmingham, the prime minister is quoted as saying: "Is this the end of an old adventure or the beginning of a new? Is this the last attack upon a small state or is it to be followed by others? Is this in fact a step in the direction of an attempt to dominate the whole world by force?"

The dangers that had been feared in September prior to Munich gave way to the empty victory resulting in "peace with honour." The swing from appeasement began gradually after Munich and continued slowly until the middle of March. The German march into the city of Prague killed the policy of appeasement and Allied public opinion rallied to the support of measures looking toward security based upon the strength of arms. England and France were determined to meet force with equal or greater force.

(d) *German Racialism Gives Way to Imperialism.*—It is important to consider not only the reasons which supported Allied acceptance of German methods prior to the march on Prague, but to consider as well the Allied opposition to German methods after March 15, 1939. It is clear that England and France agreed and accepted the principle that Germany sought to establish the rights of self-determination for all Germans living outside the Reich. This was the constant claim of the Nazi Party and the consistent appeal of the German Government. It has been expressed in the slogan, "One people, one Reich." The social revolution in Germany was considered to be a result of a growing demand for the reincorporation of German people within the borders of the German State. The methods of regimentation of the German nationals, the frequently terroristic methods of control of minorities within the State, the adoption of repressive measures to control the franchise and the press, the arbitrary demands for expansion of State boundaries at the expense of neighbouring nations; these were not approved by the Allies as polite means or procedures in a modern world familiar with the system of collective security and joint negotiations. However, through the chain of disagreeable incidents there were links which supported the Allied view that Germany had a morally acceptable right to demand that all Germans belong within one German State. So long as the creed of racialism supported the claims of the Nazi Party and the demands of the German State, the result was to set up a favourable, if rather luke-warm co-operation by England and in turn by France.

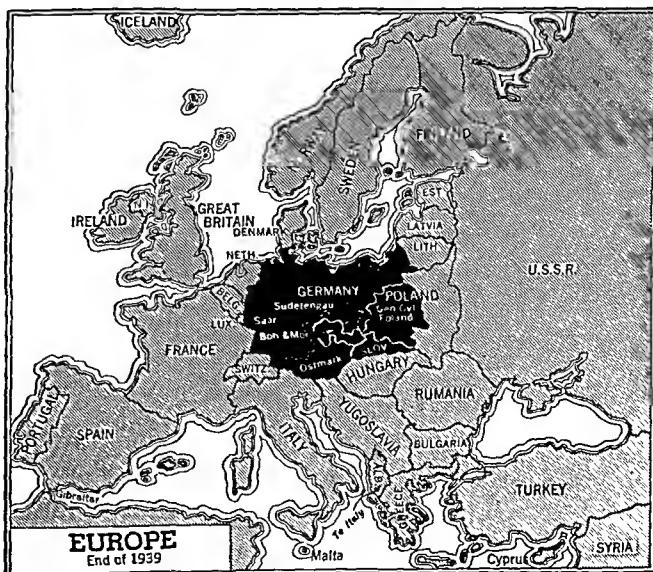

The reoccupation of the Rhineland, the remilitarization program, the acquisition of the Saar, the annexation of Austria and the German victory at Munich; all were acceptable only because the doctrine of racialism—one creed for all citizens, one people,

one Reich—was continually advanced as support for the German demands. The denunciation of the Treaty of Locarno and the march to Prague were startling examples of the change from a German policy of racialism to a German state policy of imperialism. The march to Prague was a march out of the pages of *Mein Kampf* and away from the dogma of the Nazi Party in the direction of conquest in the grand manner. The era of Pan-Nazism had ended. The era of demands, supported by morally acceptable and reasonably intelligent claims, was succeeded by violent excursions into the field of invasion by armed force over the territory of weaker nations. Until March 15, 1939, Germany had taught Western Europe how to hang an olive branch on a hayonet. After Prague the Allies severed the symbol of peace with a sharp blade of distrust forged in the hate of an aroused resentment.

(e) *Appeasement Succeeded by Rearmament.*—Shortly after the Munich Agreement, England and France began preparation for rearmament. In England plans were announced for raising approximately 19 divisions totalling 300,000 men, and estimates were drawn for mechanization for as many of these divisions as possible. Naval construction was increased and provisions were made for extended training of naval reserves. Limited conscription was adopted without serious protest in Parliament or throughout the country. Plane construction was speeded up, and the air industry received substantial subsidies from the Government. Preferred treatment for labour and management assistance was provided in order to assure efficiency in British industry. Orders were placed in the United States for aircraft and for some essential items of aeroplane equipment. A national program for A.R.P. (Air Raid Precautions) received wide publicity throughout the nation. Every British citizen was made aware of the dangers to be expected from the sky and all were instructed in self-protection and assistance in the protection of others in the event of air bombardment. Complicated plans were drawn up for the evacuation of children from metropolitan centres, and in turn residents in the less populated districts were asked to provide shelter and care for the thousands of youngsters removed from the city. All these activities were evidence of a determined view to be prepared for adequate defence. They do not appear to have been evidence of a nation-wide desire to engage in war.

In France similar activities were undertaken with the speed that a mixed political situation would permit. French reserves were given warning notice of a probable call to the colours in the near future. Labour was persuaded to accept a modification of recent provisions allowing a 40-hour week. Pending disputes between labour and industry were partially settled by Government intervention. French manufacturers were requested to speed up production of essential war materials, and the aviation industry received special attention of the Government. Extensive renovations had to be made in plant equipment in order to bring the level of plane production up to a comfortable margin of security. In all departments of the armed forces, in labour, in industry and throughout the civilian population, France began to prepare for the war to come.

Throughout Europe nations, large and small, turned away from the vanishing prospects of peace and with feverish haste began to look to their defences for war. Conciliation had resulted in capitulation, force had finished the fight for freedom. Racialism had given way to imperialism, and appeasement was followed by the race to rearm and defend. (See also AIR FORCES; ARMIES OF THE WORLD; CHEMICAL WARFARE; NAVIES OF THE WORLD.)

(f) *The "White War" or War of Nerves.*—It is clear that the pursuit of state policy, by the use of threats of force during negotiations, as distinguished from the familiar use of force on the field of battle, has introduced a new type of state warfare. It has always been recognized that the smooth road of conquest runs

across the polished surface of international conference tables. Yet the modern world has seen the development of a new technique in the application of this invisible but potent force during the last few years. The deliberate use by totalitarian states of the threats of force, the practice of launching violent verbal and press attacks, and abusive criticisms against the Governments of neighbouring states, the promotion of civil disorders within and among minority groups in adjacent territories, the vociferous claims of wounded pride and dignity due to alleged denials or delays in the immediate rectification of so-called "just" claims; these distinguish the methods employed in the "white war" of nerves.

At no time has this new technique been more evident than in the conduct of interstate relations in Western Europe during the period 1936–39. The final pre-war phase of "white war" began after the march to Prague in March 1939, and ended in Sept. 1939.

(1) *German Demands on Poland.*—On March 24, 1939, Germany presented a series of demands to the Polish Government in Warsaw. The date of these demands gains added significance when it is realized that they were made one week following the establishment of a German protectorate over Bohemia and Moravia. The demands included the following:

The return to Germany of the Free City of Danzig. Poland to be assured a free zone in Danzig by Germany.

The right to construct a German motor highway and railway across the Polish Corridor between Germany and the Province of East Prussia.

The suggestion that Germany might offer to conclude a 25-year non-aggression pact with Poland and accept the altered Polish boundaries as permanent.

Impartial observers consider these German demands at least partially justified. Poland, when reconstituted by the Paris Peace Conference in 1919, included nearly 11,000,000 non-Poles representing 30% of the total population of the new state. Over 1,000,000 of this total were Germans. These former German nationals, living in former German territory in the provinces of Poznan, Pomorze and Silesia, considered Polish rule intolerable. They constituted a small but determined minority opposed to the new Polish Government, and supported in this opposition by willing encouragement from the powerful Fatherland—Germany.

In Danzig (*q.v.*), which was a predominantly German city in 1919, an international commission, under League of Nations control, administered the Free City by means of a local legislative body. The city was a great asset to the economic welfare of Poland despite the recent construction of the new Polish port of Gdynia. The further possibility that Germany might acquire the city as the first step in a general reoccupation of the Corridor made Poland defiant in her refusal to accept the German demands. The Government of Poland had many internal flaws and was considered a military dictatorship.

Minorities were allowed a minimum of freedom in respect to the franchise or the exercise of other national rights accorded citizens in democracies. It remains true, however, that the German methods of presenting their demands and the technique of the "white war," plus the British and French offers of assistance made to Poland, combined to prevent calm examination of demands which might have had considerable merit.

On May 5, Foreign Minister Beck firmly refused to consider any German demands on the Polish state. During the last week of Aug. 1939 a set of German demands on Poland was the subject of last minute consideration prior to the outbreak of the combat phase of the war.

(2) *British and French Attempts to Create a Non-Aggression Front.*—Britain reversed an historic policy of no alliances with states outside of Western Europe when it exchanged pledges of mutual assistance with Poland and Turkey and made formal guarantees to Greece and Rumania in 1939. France already had a treaty of assistance with Poland and followed Britain's lead in making new pledges to Greece, Rumania and Turkey.

Both countries were determined to create as promptly as possible a bloc of small nations joined in common resistance to further German expansion by a continuation of the technique of a "white war." A non-aggression front was the objective of the two states. Their efforts were taken swiftly and in complete agreement that the hope for peace could be supported by such guarantees.

On March 31, Britain announced that the Government saw "no" justification for the substitution of force or threats of force for the methods of "negotiation" in the German-Polish dispute. Britain felt bound to lend support to Poland if any action occurred which "clearly threatened Polish independence," and which the Poles "considered it vital to resist with all their national forces." France was already pledged to assist Poland with respect to the support of the independence of that state.

On April 13—shortly after Italy had assumed control in Albania—Britain pledged all its support to Greece and Rumania in the event the independence of either was threatened and that resistance was made by the armed forces of these nations. France confirmed these pledges and joined England in the expansion of the non-aggression front. On May 12 England offered a pledge of assistance to Turkey in the event of an act of aggression leading to war in the Mediterranean area. And on June 23 France and Turkey exchanged identical agreements, and the Republic of Hatay (the Sanjak of Alexandretta) was ceded to Turkey by France. As an example of the distance travelled by France away from the state of collective security, the disposal of the Republic of Hatay was a direct violation of the terms of the French mandate over Syria received in 1920 from the League of Nations. The countries of Poland, Rumania, Greece and Turkey were now in common agreement with England and France that further aggression should be resisted with force. A formidable non-aggression front had been created. In an effort to overcome strategic difficulties preventing the prompt realization of practical military aid, England undertook negotiations for a mutual assistance pact with the Soviet Union.

(3) *Allied Negotiations with Russia.*—Britain opened negotiations with the Soviet Union for a mutual assistance pact in April 1939. France already had a mutual assistance pact but not a military alliance which Russia had accepted in 1935. The first proposals made by England were considered unsatisfactory by Russia. It appears that England sought an agreement whereby Russia would aid Poland and Rumania, subject to Polish and Rumanian decisions on time and method; and further subject to the actual

rendition of French and British military aid to those countries. Russia refused this offer because it contained no guarantee of British and French assistance to the Soviet Union, and further no guarantee was made concerning the status of the Baltic states of Lithuania, Latvia and Estonia.

In May, negotiations were reopened when England offered a draft of a treaty of mutual assistance for consideration by France and Russia. This pact was to be subject to the terms of the League of Nations Covenant, and did not include any guarantees to the Baltic states. In the light of later events it is important to consider that Estonia, Latvia, Lithuania and Finland were reluctant to reject guarantees against Nazi aggression and also were reluctant to accept guarantees made by the Soviet Union. These states were interested primarily in maintaining neutrality.

Russia did not accept the second British offer, and new proposals were drafted in June for consideration by the Soviets. These new proposals were presented by William Strang, Eastern European expert of the British Foreign Office. In August, England and France sent a joint military mission to Moscow to discuss the extent of Russian aid available for use in Poland and Rumania. The conclusion of a Soviet-German pact on August 23 nullified all Allied efforts in this direction, and further negotiations were rendered impossible.

The British (and French) have justified their failure to conclude a pact with Russia on several grounds. It has been said that Poland refused to accept Russian military aid, that the Russian military aid would in fact prove to be a liability, that the Allies could not join Russia in domination of the Baltic states, and finally that Russia had no desire to help the Allies. It remains true that Russia is a totalitarian state, familiar with the rules of power politics, and concerned primarily with the welfare of the Soviet Union. England and France have equal concern for their individual welfare, but were pursuing the policy of defending the rights of small nations against the technique of "white war." Again, Russia had been excluded in the negotiations at Munich, and the Soviet statesmen suspected the sincerity of British and French proposals for either diplomatic or military agreements. The Allied negotiations with Russia proved to be a failure insofar as an attempt to extend the non-aggression front was concerned. The conclusion of a Soviet-German pact appears to have been the final action which prevented any agreement between the Allies and Russia. And this agreement further appears to be the first German victory in the diplomatic counter-offensive aimed against the Allied efforts for a non-aggression front.

(4) *The Soviet-German Pact.*—The Soviet-German non-aggres-

FRENCH TROOPS moving up to a position in captured German territory early in Oct. 1939

sion pact was concluded on Aug. 23, 1939. It appears that negotiations leading to the final acceptance of this agreement were begun in the early spring. The first indication in official documents appears in a report made on August 16 by Sir Nevile Henderson, British ambassador to Germany, of a conference held with Baron von Weizaecker, German secretary of State, who "seemed confident and professed to believe that Russian assistance to the Poles would not only be entirely negligible but that the U.S.S.R. would even, in the end, join in sharing in the Polish spoils." It is probable that the Soviet-German negotiations were under consideration at the same time that Allied proposals were being discussed in Moscow. A trade agreement between Russia and Germany had been signed on Aug. 19, 1939. By this agreement the Soviet Union contracted to supply Germany for two years with raw materials valued at 180,000,000 marks. Germany, in turn, promised to supply machines and manufactured goods valued at 200,000,000 marks.
